SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 13th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

Please note the change of address.

North Mysore. *Jan. 3rd*, 1899—*Weather.* Most unseasonable, hot and cloudy. A few light showers in places—*Crops.* Promise to be very good. Estimates are all being raised. Outturns from vats, as a rule, good; on the coast not so good as usual—*Plant Disease.* Leaf disease in a mild form on most places. Considering the crop trees look very well and promise well for next season.

South Mysore. MUDIGERE, 31*st Dec.* 1898.—This is a bad time for travelling or correspondence, so I cannot give much more than my own experiences; whether my neighbours find things the same I cannot say. *Weather* is seasonable even to the usual X'mas clouds and threatening of rain. We are still uncertain whether it will fall or not, so far I have only seen a drizzle of two minutes' duration. *Crop* would be coming in fast but for the fact that labour is very short with those who depend in any measure on local coolies. Paddy cutting takes up all their time, and double pay won't bring them in. From what little I have heard, outturns vary from normal to good, but your correspondent "Kartary" is a better man than we get in this district if his coolies will pick him enough to give nearly a bushel of parchment for the day's pay. We have many coolies who, in a good crop, can pick two bushels, but I don't think more than a bushel is ever demanded for a woman's pay, and most of us find that 2 bushels of good fruit give very little over a bushel of parchment, using the same bushel for both. Of *Diseases* little can be seen, many of my trees are very shuck from the amount of crop combined with a touch of leaf-disease earlier, but, as a rule, coffee looks unusually well; bud for next year is rather too far forward in places. A shower of rain would bring out quite a large blossom now. *Health* is good, *Labour Supply* bad. Grains are dearer, only because people are too much occupied with their work to bring grains to Sante. I wish you and your supporters the best of good times in the New Year.

COFFEE AND CO-OPERATIVE AGENCY.

REFERENCE was made in our last issue to a suggestion of the Shevaroy Planters' Association on the subject of co-operation. Having remarked on the vagueness of this suggestion, we had intended to await comments from District Planting Associations or members thereof before touching further upon the subject. The Chairman of the Shevaroy Planters' Association has, however, now sent the *Madras Mail* a rough sketch of a plan of co-operation. In giving this on another page, we are but doing justice to Mr. GOMPERTZ and his Association. In passing a few remarks on the scheme, we are but fair to ourselves, and heedful of what appear to us to be the true interests of coffee-planters in India. It is in no unfriendly spirit that we ask for further elucidation of what is at present a very crude statement. We are only opposed to the Shevaroy scheme because it appears to us to be only *part* of a scheme, and not enough to be useful or efficacious. A great deal might be said on various aspects of the question that has been raised, but we still hesitate to go fully into the matter, feeling that Mr. GOMPERTZ and others have yet a great deal to explain before his scheme can be considered seriously as a basis for discussion. For instance, in point No. 6, he alludes to "the limit of a holding as say, 20 shares (of Rs.100 each)." Does this mean that no planter would be allowed to take up shares to a larger extent than this? Whatever the reply to this may be, some particulars should be given to show how it is estimated that 1½ to 2 lakhs of rupees could be raised among Indian coffee-planters alone. Then, again, the Co-operative scheme, which is to take effect *in England*, is apparently to be managed by a Board of Directors *in India*. The constitution of that Board would be of vital importance to the success of the enterprise, yet the suggestion has been thrown out that the first Board should be selected in quite a haphazard fashion, and be formed, in fact, of the gentlemen who happen to constitute the Committee of the U. P. A. S. I. The weak point here is that a fair proportion of these gentlemen are Tea-planters who have no interest in coffee, and no experience of the coffee industry or trade. Besides this, it remains to be seen whether every member of the Committee would be willing to become a shareholder in the proposed concern.

Then as to the English side of the business. It would be well to know if Mr. GOMPERTZ has, or else that he has not, any special London firm in view, competent and willing to undertake the agency of the proposed "Pure Coffee Supply Association." In the former event—which appears a somewhat improbable one—a few words as to the experience the firm has had would be very welcome to all interested in the success of the project. In the latter event, some idea might be given of the inducements it is proposed to offer to an experienced firm, which would probably have to abandon established connections in order to undertake the new agency. Mercantile firms are not like the dog on the bridge in Æsop's fables. They do not relinquish the substance to plunge after the shadow; and it is a little difficult to see how, without incurring great initial expense, the proposed Association could make it worth the while of really competent people to throw ordinary trade aside and go heart and soul with Indian planters in the work of pushing Indian coffee on co-operative lines. Again, what precautions would be taken with a view to excluding fine coffee other than Indian—for instance, Costa Rica, Honduras, Guatemala, New Granada, Jamaica sorts, &c.,—from the scope of operations? The title suggested would not clearly show the public that *Indian* Coffee, and that alone, was to be supplied. If that is the intention, it should be shown from the outset, and measures should be taken to prevent Costa Rica *et alia* from reaping the harvest that springs from the good seed of Indian co-operation. Then, again it might be well to give at once some idea of the number of small retail shops it is proposed to start in London, and of the cost of opening them and carrying them on. Also the expenses to be incurred in respect to travellers. It appears to us that if these charges would fall on the Agents, very handsome terms would have to be offered; if on the Association, they would have to be provided for in some way. Then, at starting, the Association would have to be prepared to keep its shops going at a loss at first. For our own part, we doubt if shops restricted to the sale of coffee alone could *ever* pay, but that is a point that need not be dwelt upon here. Our present aim is merely to mention various matters in regard to which information should be afforded, or estimates—however rough—made, before the new project can be considered with any hope that a satisfactory scheme may be arrived at.

There is yet a third section that must not be overlooked. The management in India and the management in England must both be efficient, or any scheme of co-operation must fail under a practical trial. It is also essential, however, that the relations between the London management and the Indian management should be established on a sound business basis. The first point that suggests itself in this connection is that of finance. No doubt, as Mr. GOMPERTZ assumes, drafts might be negotiated at time of shipment, and planters thus placed in funds with no more delay than is incurred when shipments are made, as at present, though a curing firm or a Coast Agent. It remains to be said, who would settle the amount of the advance? That difficulty got over, who would assess the market value of each shipment of coffee sent home for sale? It does not appear to be proposed that the Association should *buy* in India. It is to sell in England, and to sell retail. Different coffees are worth different prices. Different shipments could not be kept separate and retailed separately. Even were this possible, few planters would care to await sale of the last pound before having a settlement in full. This is a matter that would need a good deal of thought before any workable system could be put forward. If Mr. GOMPERTZ would kindly give it his attention, and elaborate his rough sketch a little, he would probably find his fellow-planters ready to discuss his scheme. It certainly appears to us that the more the question of Co-operation is considered the more certain will be the conclusion that to be really successful a scheme must be bold and comprehensive, and that if a small scheme be started at all by coffee-planters in India, it must deal with some other branch of the business than the retailing of supplies in England.

THE LEVEL OF TEA PRICES.

The Ceylon Observer seems to fear that artifice is interfering with the balance of demand and supply as well as with Exchange, and that this has something to do with the low

level of prices of Tea in Great Britain. Our contemporary remarks that the statistical position was seldom if ever more favourable. "Fine plucking" has been the rule in Ceylon, new markets have been opened up and shipments to London have been kept below those of the previous year—and yet prices have not risen or even been maintained. The question are then asked:—"How is this? Can there be some truth in reiterated allegations respecting the adverse influence of the large tea buying and packet-distributing houses that have, of late years, come into existence? We know what "corners" and "trusts" have done with certain branches of trade in America. Is there something of the same kind to be realised in the United Kingdom?" It is to be hoped not, and we see no reason to fear the contrary. Perhaps "fine plucking" has had an effect just the reverse of that which was anticipated. Indian and Ceylon teas have acquired reputations in respect to certain qualities. Any change of system of cultivation, plucking or manufacture, that is likely to have a marked effect on the quality of the teas, may not be at once appreciated by the consumer, even though the change effected be for the better. There appears to be a widespread belief that Indian and Ceylon teas have not *improved* in quality of late years. The opinion of the expert on this point is worth more than that of the public. Yet both are liable to be affected by the fall in price and to regard this as the effect of a fall in quality. Then, too, the public taste varies: what pleased last year may not please this, and so on. We take it planters would at least do well to continue their effects to improve the quality of their teas so long as they can do this without very materially increasing the cost of production. In the long run, probably, it is cheapness that will tell.

RAILWAY SCHEME FOR THE COORG DISTRICT AND WEST COAST.

AN article from "*Railway*" copied into the *Madras Mail* of 22nd December deals with alterations and extensions of the Madras Railway system towards the West Coast, and as reference is made to the proposed line from Mysore through Coorg to that Coast, in which the Coorg planters are interested, a few remarks regarding it will, no doubt, be acceptable. It would be well also if a discussion by Planters and others acquainted with the country to be traversed were to follow.

The forming of a line from the Capital of Mysore to Coorg and thence to ports on the West Coast seems now to be within measurable distance of accomplishment, for it is understood that General Cole, at one time an estate proprietor and Commissioner in Coorg, has organized a syndicate to take up the work. It is to be hoped that the unfortunate fact of his having been struck down by a paralytic seizure will not greatly delay matters.

His scheme, so far as I have been able to ascertain particulars, is the making of a line from the town of Mysore westward *viâ* Hunsur into Coorg, where it is to bifurcate—one branch going north-westward to Mangalore, the other in a south-westerly direction to the port of Tellicherry, the whole to be on a 2′—6″ gauge.

The project, with one or two exceptions, should commend itself to the planters of Coorg. The most notable exception is the gauge. It would, I think, be a grave mistake to introduce a gauge differing from the metre-gauge lines with which it must be linked, namely, the Southern Mahratta which runs into the town of Mysore, and the line to be formed between Erode and the Nunjangad extension of the present Mysore system. This will connect Mysore directly with the South Indian Railway as also with the Madras Railway. Moreover, the Madras Railway extension from Calicut to Tellicherry is to be on the metre-gauge. It stands to reason too that a line running from the interior of the country and from the heart of such a thriving province as Mysore linked with two extensive systems, such as the Southern Mahratta and South Indian systems, will be called on to carry a large and ever increasing traffic.

Another part of the scheme which appears to be of very doubtful expediency, as involving expense incommensurate with the profit likely to accrue, is the carrying of a branch from Coorg to the port of Mangalore. To take a line from, say, Ammati or Veerajapett to that place, it would have to make a long and tedious descent down the Ghaut, and after reaching the low country would have to cover 60 or 70 miles before it got to Mangalore; and that across a country cut up by innumerable streams and watercourses and a country not particularly prolific in produce that would supply a railway with traffic. A long line exposed to the heavy and protracted south-west monsoon of the Malabar Coast is no joke. Its up-keep must be costly. To add to these drawbacks, its terminus would be a harbour which is closed to shipping for full four months of the year with the addition of one or two months when the unsettled state of the weather makes landing and shipping intermittent, unsatisfactory and often dangerous. This is surely not the sort of port that should be chosen for the terminus of a railway to serve a large and productive area of the interior. These conditions exist in the case of Tellicherry on a much more modified scale, while the port, I believe, is capable of such improvement as would make shipping and landing practicable all the year round.

The ports of the west coast where the conditions are at all favourable are the natural outlets for produce from South India, being on the European side of the continent, so that from its outset produce is directly on its way to Europe, while goods from Europe are saved unnecessary sea carriage. For these reasons I am disposed to place a high estimate on the ultimate traffic which the line would attract from the large area eastward over which its operation would extend.

The planters, too, would be brought within easy and rapid reach of the ample supplies of labour with which Tellicherry and its neighbourhood teem, and the connection with the South Indian system would render available a supply of Tamil coolies while the localities in the Mysore country where Canarese labour is abundant would be more accessible.

While General Cole's syndicate may have some claim to have the execution of the project placed in their hands, I am inclined to think it would be best carried out by the Madras Railway Company, as the public would have every confidence that, if undertaken by them, it would be carried out and worked in a thoroughly satisfactory manner. In adopting the broad gauge, they have in some parts of their system been at a disadvantage, and this is to be rectified by converting that portion between Pothanur and Calicut to a metre-gauge. I am inclined to think it would be better if they started the conversion from Erode, where the new line to Nanjangad takes off. Traffic to the Nilgiris and other stations west of Erode from South India and Mysore as well as from the Southern Mahratta system would be carried through without a break. I understand the Madras Rail-

way was built to provide for a double line in case required. It might, therefore, be possible to have a narrow-gauge line running side by side with the broad-gauge from Erode to Pothanur, and so meet all requirements. No doubt the whole business will be well considered before the Government agree to all details.

STEAM.

PRIZE ESSAYS.

ONLY one planter has entered the lists up to date. We trust that he is not to be left to strut round them alone vainly awaiting another bold enough to take up the gage thrown down. [The P. D. asks us if this should not be spelt "gauge," as there appears to be a reference to "the battle of the gauges!"]. We repeat our statement of rules concerning our first prize essay competition, the subject of which is

THE LABOUR QUESTION.

THE PAST, PRESENT AND FUTURE SUPPLY OF LABOUR IN THE . . . . . DISTRICT.

FOR the best essay on this subject from any planting district in Southern India, we offer a prize of Rupees one hundred.

RULES.

1. Write on one side of the paper only.
2. Sign your name in full, and state address (not for publication, except in the case of the winner).
3. Be as brief and concise as possible.
4. Cite your authorities when possible.
5. Mark your M.S., "Prize Essay Competition."
6. Submit not later than 14th January, 1899 (in Madras).

IT should be clearly noted that all essays sent in will be the absolute property of *Planting Opinion*, and that the proprietors will have the right to publish them, in full or abridged or revised, in *Planting Opinion* or elsewhere, and to republish in pamphlet or book form. No limit of length is fixed, but conciseness will count when "points" are reckoned up. Rupees one hundred will be remitted to the winner immediately after publication of the prize essay.

BOARD OF TRADE RETURNS.

Statistics are often puzzling and sometimes misleading. It is a little difficult to know what to make of the following, which are from the Board of Trade's Return for the eleven months ending 30th November 1898. The tables shew the Imports, Consumption, and Exports of the undermentioned articles for the eleven months ending 30th November in the present and two previous years, compiled from the Board of Trade Returns, with stock in U. K. on 30th November :—

COFFEE—	1896.	1897.	1898.

Export ..... ,,	29,966,527	33,488,414	33,454,872
Stock ..... ,,	98,005,000	91,095,000	92,970,000

The rapid growth of demand for Raw Cocoa is very marked, and it is pleasant to see that foreign *prepared* cocoas have lost some of the tremendous advantage they gained in 1897. On the other hand, the sharp fall in the demand for tea for home consumption is discouraging, while the increased home consumption of coffee is not of sufficient importance to make the hearts of planters rejoice. True, the export demand has improved ; but the statistical position of stocks has grown rapidly worse since 1896. Tea is fairly strong in this respect ; Cocoa is generally regarded as in an excellent position. Perhaps, however, the simplest way to show the comparison is as follows :—

STOCKS MEASURED BY NUMBERS OF MONTHS AVERAGE HOME CONSUMPTION AND EXPORT THEY REPRESENT.

		Months
Tea	nearly	5
Cocoa, raw	over	5
Coffee	nearly	6

From this point of view there does not seem to be sufficient difference to warrant any great jubilance on the part of Cocoa-planters, or depression on the part of Tea and Coffee planters.

THE U. P. A. S. I. SECTION.

[UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.]

The following remarks by Mr. E. E. Green, Honry. Entomologist to the Ceylon Government, will be read with considerable interest :—

Allow me to thank you for your useful and interesting Circular just received—containing a *précis* of answers to your inquiries on the 'Ladybird' question.

I take the liberty of offering a few remarks upon some of the points raised.

On p. 2 of your circular it is suggested that Ceylon is the natural home of *Lecanium viride*. I believe this to be quite a mistaken idea. This green bug first attracted attention in 1882, before which year it was unknown in Ceylon. From the rapid way in which it became dominant and spread through all the coffee districts there is a strong presumption that it was an introduced insect. I am personally inclined to the belief that the pest was introduced with Liberian coffee plants from W. Africa. This supposition gains strength from the fact that the same species has recently been recorded from Lagos, W. Africa

With reference to fungal diseases (see p. 5 of Circular). We have in Ceylon a fungus that helps greatly to keep the pest in check. At certain seasons it is difficult to find a living insect on the trees, the whole brood being *apparently* exterminated by this gray fungal growth. But the pest invariably reappears after an interval

A year or more ago I sent to Mr. Newport examples of this fungus for experiment. But his endeavours to induce the disease locally were unsuccessful. If you have any cryptogamist who would undertake the work, I would gladly supply him with material from which he might be able to make a pure culture of the disease which might possibly produce better results.

You will be interested to learn that I have now a small but flourishing brood of ladybird larvæ, resulting from the few survivors of the consignment of *Exochomus nigromaculatus* received from

the Cape of Good Hope, some of which are now completing their transformations. Fresh larvae continue to appear in the breeding jars. I am bringing up these larvae entirely upon *Lecanium viride*. I am strongly of opinion that quick transport of the living insects by letter post will prove to be the most satisfactory method of introducing the ladybirds. A constant succession of *small* consignments would probably produce better results than one or more large consignments. If I am able to properly establish this Cape Ladybird in Ceylon, I shall be glad to forward a supply to your Association for experiment.

With respect to the concluding paragraph of your Circular (p. 6). Although the study of the indigenous enemies of *Lecanium viride* will be an important step and productive of considerable scientific interest, it must not be expected that *indigenous* enemies can successfully cope with an *imported* pest. It would be necessary to first eliminate the natural enemies of those predacious insects. By introducing a natural enemy from another country it starts with the same advantages as those which enabled the introduced pest to become dominant, viz.:—the absence of its own natural checks.

We have several indigenous ladybirds in Ceylon that feed more or less upon *Lecanium viride*. I should be pleased to forward living examples of these to anyone who would be willing to look after them, on the chance of their finding more favourable conditions for increase in India than they enjoy in Ceylon.

* * * *

Apropos of the above, the following is taken from a letter from Mr. Green to the *Ceylon Observer* with reference to an extract from the Berlin "Echo" that was reproduced among *Planting Opinion* notes in issue of 24th ultimo :—

From an examination of Prof. Zimmermann's paper, it appears that we already have (and have had for many years) this same fungus attacking the "Green Bug" on our coffee.

It appears as a greyish mould covering and forming a delicate fringe around the bodies of the insects. At certain seasons of the year it is difficult to find a single bug that has escaped this disease. But that a certain number of the insects do survive is evident from the fact that the bug re-appears in equal strength year after year.

This disease doubtless helps to hold the pest in partial check, and prevents it from becoming even more troublesome than it now is.

* * * *

Professor John B. Smith, Entomologist at the New Jersey Agricultural College Experimental Station, remarks :—Under favorable circumstances importations may be of benefit, if the insect to be dealt with is also an imported insect; but we have not yet had any demonstration of the possibility of an injurious insect native to one locality having been controlled by a predatory or parasitic form native to another clime or country.

* * * *

From Mr. Green's remarks it is fairly evident that the green bug is an imported pest and he has also stated that the lady bird imported from the Cape feeds on the *Lecanium viride*.

NOTES.

Low priced Coffee. Common South Sea Island Coffee has been sold at 31*s*. per cwt.

Coffee in Coorg. Good crops are reported from Coorg, and we are glad to learn that estimates will be more than secured.

Sale of a Ceylon Tea Estate. The Bodawa Estate was sold the other day for Rs. 19,500. It is above 118 acres in extent, of which 40 acres are planted with tea; and includes also a paddy field of a little more than 3 acres.

The Indian Tea Association. According to the *Indian Daily News*, signs are not wanting that members are not altogether satisfied with the lines on which the Association is now run, and that some alteration will be needed, if it is to remain at all representative.

Calcutta Tea Sales. About 11,000 packages were sold on 22nd ult. at practically previous rates, teas for price being rather firmer. There was a fair demand for the Bombay market. The next sale is on the 16th inst. For most gardens the last sale practically closed the season.

Cacoa Pests. We give to-day a copy of the final report on Cacao pests by Mr. J. B. Carruthers, who was recently employed in Ceylon as Cacao Cryptogramist. The report is very interesting, and will be useful to any planter whose attention is given to the cultivation of Cacoa.

Dutch Tea. If not as active as the Ceylon planters in canvassing new markets, Dutchmen are at least closely watching the progress of India and Ceylon. They appear satisfied that the free breakfast table in England will not be reached just yet, and that a preferential tariff in favor of British Tea need not be feared.

London Tea Sales. Cabling to Colombo on the 22nd ult., Messrs. Gow, Wilson and Stanton reported a weak market, with prices unchanged, but apparently a shade easier. *Reuter* reported that of 17,000 packages Ceylon Tea offered now were sold, and of 17,000 Indian 15,000 are disposed of at an average of 8*d*. (a decline of $\frac{1}{8}d$. for Ceylon and $\frac{3}{8}d$. for Indian.

Davidson & Co., Ld. We have to thank this firm for a very handsome blotting pad, with calendar and diary attached. A map of Colombo, a Telegraphic code for ordering Tea machinery and interesting accounts of various machines are among the very interesting and comprehensive information given in connection with this "diary and blotter 1899," which is among the most useful we have yet seen.

A Japanese pest. *Indian Gardening* remarks :—Importers of trees and plants from Japan should be on their guard against the introduction of a scale insect, named by Professor Tryon as Diaspie amygdali. It is a pest of the most dangerous description, and may give greater cause for alarm than the much-dreaded San Jose scale. It is already in Australia—in fact, some have thought the pest was indigenous to that continent, but eminent authorities generally place Japan as the original home of the species.

Indian tea for the Indians. A writer in the *Indian Sportsman* says :—"Many native tea drinkers asked me for green tea, as they have a theory that green tea is less heating to the system than black tea. Some of them told me that they drink tea regularly during the cold weather, but have to give it up in the hot weather as it is too heating, but if they could get green tea they would drink it all the year round. I cannot pretend to say how far this theory is founded on fact."

A new Tea Drier. A Bedford correspondent warns the *Ceylon Observer* to look out for Mr. Bett with a Surprise Tea Drier. He provides an immediate surprise by adding :—"Touching on tea, to enable us to have *fair play* in the sale room in Mincing Lane, could it not

be possible to have our teas put up at an upset price, as in the case of the Government Agent at Badulla, when the planters arranged to buy the land at upset price and divide afterwards? He raised the upset price from R10 to R100!"

Coffee and Tea in the States.

The following clipping from a price list of a Coffee and Tea Store in New York gives food for thought when English prices are compared with those here given :—

Our celebrated Mocha and Java Coffee, quality unsurpassed, 4 lbs for $1.00, ℔ lb.	27c
Fancy Santos Coffee, bean or ground, ℔ lb.	19c
Choice new crop fine-flavoured Teas, green, black, or mixed, ℔ lb. ...	30c
High-grade new crop Teas—Formosa, Oolong, English Breakfast, Japan, Assam, Ceylon, or Mixed—℔ lb.	40c

The Depression in Tea.

Planters in Ceylon are apparently under the impression that the combined purchasing interests at Home keeps down prices of Tea, and it is now said that as there is not a large enough supply of low-grade leaf fine quantities are being forced down in price to take their place. We give this for what it is worth, merely adding that we have seen much assertion but no proof, and that it has not even been proved that there is an insufficiency of low-grade teas.

Cinchona Cultivation in Ceylon.

Alluding to the efforts lately made to give a new fillip to Cinchona plantation in Ceylon, the *Chemist and Druggist* remarks that it would be rash to say that the movement will lead to anything, as Ceylon planters have been too severely bitten by their Cinchona operations ; but as the failure of these was evidently due to their cultivation of inferior barks, it is probable that with Ledgeriana bark, and a moderate amount of Succirubra, they would make more of it now.

The Tea Corporation of Ceylon, Ltd.

This Company has been criticised pretty fully of late, the most rigorous of its candid friends being Sir Charles Lawson (of the *Madras Mail*). The report and accounts of the directors were received but not adopted at the Annual General Meeting, and it was resolved that a committee of investigation be appointed to confer with the board, with full power to investigate the transactions of the Company since the date of incorporation, and to report to the shareholders at a meeting to be subsequently called. It is a pity that Sir Charles Lawson declined to accept a seat.

Artificial Fertilisers.

With reference to the advertisement of Mr. R. J. Harris, of London, that appears on another page, we have been requested to explain that Mr. Harris intends to keep his Madras Agents, the India Trading Company, Limited, informed by *cable* of current prices, some without engagement, other quotations from for a given time. Planters will thus know the exact rates at which they can order supplies from time to time, and if Mr. Harris' figures are found to compare favourably with those of other suppliers, he should find a fair business passing to him as one result of the enterprise he displays in making what seems to be a new departure in methods of advertising.

A Midland Tea Company.

The Bombay Tea Company, Limited, has been formed to acquire, carry on, extend, and develop the business of the Bombay Tea Company, wholesale and retail tea dealers, which was founded in Birmingham in 1889. The Company has some 18 branches in the various large towns of the North of England and the Midlands. The capital of the Company is £100,000, divided into 50,000 six per cent. cumulative preference shares and 50,000 ordinary shares of £1 each. The vendors have fixed the purchase price at the sum of £70,000, and stipulate for an allotment of one-third of the present issue of shares in part payment thereof, the balance to be paid in cash. The present issue is of 35,000 preference and 35,000 ordinary shares.

Ceylon Tea in America.

The following is an extract from a letter from Mr. William Mackenzie to the "Thirty Committee" :—"I dined at the best restaurant in Omaha. I asked for Ceylon tea, the waiter did not understand. The proprietor came forward : he had never heard of it, he kept Japans, *but he had never tasted tea in his life.* He was an elderly German. From Omaha, I went north to St. Paul and Minneapolis, known as the twin cities, and containing about 450,000 people. They are the centres of the wheat and corn milling and lumber trades. I called on a firm of wholesale tea merchants. I found their store full of Japan tea chests. I asked if they did anything in Ceylon teas. They said about 25 chests a year; we keep them to mix with very weak Japs, they bring up the strength."

China's Cheap Teas.

Interviewed recently by the *Times of Ceylon*, Mr. Fairhurst, late of the Foochow Tea Improvement Company, said there was a great demand in the English market for common teas at about 4½*d.* or 5*d.*, and China could produce better teas at that price than Ceylon was able to. He gave as an explanation of this, that the Chinese method of manufacture of cheap teas was the better one, as although machine manufacture improved the appearance of fine teas, it had not that effect with the common kinds. Ceylon tea, Mr. Fairhurst remarked, ought to do well, considering the shortness of the amount exported from China and India, the falling-off during the past year with regard to China black teas, as compared with the previous year, being approximately 5,000,000 lbs. The demand in London was, as he had before stated, for common teas.

Dutch Government Cinchona Plantations.

The total expenditure in 1897 was equal to about £7,680, of which about 5·9 was incurred in new buildings and repairs. The estimates exceeded this expenditure by £155. In 1896 the expenditure was about £7,550. These figures work out a cost per lb. of 2·3-5*d.* in 1897 against 2·5-11*d.* in 1896. The gross returns for the crop of 1896 amounted to about £17,644 at the sales in Amsterdam, with a profit of about £8,100, to which has to be added profit made by sales in the East Indies, which brings the total profits to about £8,300. The expenditure of about 2·5-11*d.* has to have added 6-11*d.* for freight and commission on sales, which makes the cost of the bark per lb. to the Government 3·2-11*d.* Deduct this from the average price obtained per lb.—namely, 5·0-11*d.*—and a net profit of nearly 2·7-11*d.* per lb. remains.

Manuring.

The *I. P. G.* remarks that Planters, especially those in charge of the older gardens, must now admit that, unless stimulation and renovation is resorted to, more or less extensively, it is hopeless to battle against the adverse circumstances that have arisen ; and

without endorsing the opinions of those whose wholesale condemnation of the quality of the teas of the past season at its commencement, it stands to reason that tea cannot be kept up to the mark after half a century's incessant cropping and exposure of the soil to denuding atmospheric influences. Extensions on new lands, even if the older plantation is definitely abandoned, are out of the question under the present outlook, for funds will assuredly not be forthcoming; hence it behoves planters to make the most of the material at hand, and by copious manuring to get all out of the old gardens they can.

Cinnamon.

At the last quarterly sales prices declined, as was anticipated, but the quantity sold has exceeded all anticipation. Close upon 4,000 bales, a little over half of which consisted of fine and good sorts, passed the hammer, and 2541 found buyers at a decline of 1d to 2d per lb. for fine and good, and ½d to 1d for medium and ordinary. The *London Commercial Record* remarks:—

"Chips, after a smart spurt, have relapsed into their former state of inactivity; they have been unduly and artificially pushed and will suffer accordingly. It is a pity Chips are sold at all, for if Colombo would decline, as dealers there did promise some time ago not to deal in them, quill Cinnamon would gain in value to the benefit of planters, dealers, shippers, in fact, to all concerned. In spite of the decline Colombo remains firm, it being apparently considered that the large quantity taken out of the sales indicates bareness of stock in the hands of dealers and consumers. The sale of about 2,500 bales out of about 4,000 bales certainly implies a healthy state of the Cinnamon market, and we should not be surprised to see that prices have touched their lowest point."

The 1898 Tea Season in the North.

Commenting on the last tea sale of 1898, the *Indian Daily News* writes:—

"Thursday's auction, as far as most gardens selling on this market are concerned, practically closes one of the most disastrous seasons in the history of tea. High exchange, dear money, excessive ocean freight, and the fear of the crop exceeding the demand have combined to reduce prices to what is, to many concerns, a ruinously low level, with the result that Banks and Agents have begun to look askance at tea, and weak gardens are being forced to the hammer for want of finance. This is a pity, as there is every indication that we have seen the worst, and that, with exports to the United Kingdom only about 1 million pounds ahead, and an increase in home deliveries, during the past six months of 8¼ million pounds over the corresponding period of last year, the statistical position is getting so strong that a better state of things must soon set in.

Indian Finance Committee and Silver.

"I am assured on good authority," says the London correspondent of the *Manchester Guardian*, "that as far as the Indian Finance Committee is concerned 'silver is dead,' and nothing in the shape of bimetallism will be recommended. The various schemes of the Government of India, of Mr. Lindsay, and others are, I hear, to be put aside in favour of a development of the existing arrangements on the lines of the original Barbour scheme, and the only vital question the Committee has to decide is that of the ratio. There are those who think the present rate should be raised and others who are in favour of a reduction: but the bulk of opinion is in support of the proposal to give the rate fixity at 1s. 4d. It may be regarded as settled, I believe, that the mints will not be reopened to silver, and that in future the coinage in that metal will simply keep pace with the ordinary currency requirements of the Government. Lord Curzon said the other day that the really important thing is fixity of exchange, and the advocates of 1s. 4d. can urge, among other reasons, that its acceptance will cause no initial disturbance of the existing rate."

Cardamoms.

The subsidence of plague in Bombay is having a marked effect on prices of cardamons. Last year India bought next to nothing, and Europe had to swallow almost the entire crop, but this year Bombay dealers mean to have their share again in the business, and they are buying Ceylon descriptions on a very large scale, paying prices which range far above London parity, and which absolutely exclude European competition. Strange to say, they confine their operations almost entirely to fine descriptions of Mysores, and neglect Malabars and ordinary sorts of Mysores. This, as a Home paper observes, is extraordinary, and greatly at variance with their former mode of operations, and it would almost seem as if they had taken their cue from the London market, where the same preference for fine Mysores over Malabars exists. It remains to be seen whether in the end prices for these neglected sorts will not be forced up by consumers when, in lieu of fine descriptions, they will be obliged to take inferior sorts to satisfy their requirements. At the London sales of the 8th ultimo the selection offering was not such as to draw forth competition, and whilst an odd lot or two of good brought valuations, the remainder sold decidedly easier, more especially the Malabars.

The Colombo Tea Sales in 1898.

The *Ceylon Observer* and the *Times of Ceylon* have published statistics of the Local Tea Sales during 1898, and have also given a few figures to show comparisons with previous years. No doubt, these figures are sufficiently near accuracy for all practical purposes, but the fact that they do not tally certainly leads one to doubt their trustworthiness. In giving the yearly total sales of tea in Colombo since 1890 the two papers give identical figures in no single instance. Again, in following the course of sales, week by week, during 1898, our contemporaries differ just as widely and as systematically. Our deductions can only be approximate, therefore. We may say that during 1898 the average price ranged between 31 and 40 cents. with Exchange varying from 1/3 21/32 to 1/4 1/16; and that the *Observer* gives the following as the

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50 lbs.	Nitrogen.
57·38 „	Potash.
14·92 „	Lime.
13·68 „	Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

statistics of the last ten years :—

	Offered lb.	Sold lb.	Av. c.	Exchange Demand s.d.
Total				
1898..	35,204,334	28,124,072	35	1 3 7-8
1897..	33,776,753	26,132,080	35	1 3 1-8
1896..	32,291,570	25,402,634	41	1 2 13-32

1889..	6,841,529	4,627,762	46	1 4 1-4

The Foochow Tea Improvement Company.

The *Times of Ceylon* offered the following telegraphic item as a Christmas Box to its planting readers :—"The Foochow Tea Improvement Company, finding it an impossibility to make headway with the poor quality of Chinese leaf obtainable, is dissolving business. The Manager and the Engineer are seeking employment in India and Ceylon." The collapse of this enterprise has since been explained by Mr. Thomas Fairhurst, in an interview with a representative of the *Times of Ceylon*. He said the Company tried their experiments in improving teas about twenty miles from Foochow, in order to avoid any possibility of friction with the natives. The experiments, which were superintended by Europeans, were carried out in a very poor district, and it had since been thought if they had been undertaken in the more productive districts, 200 or so miles distant, such as Panyong and Scumoi, a larger measure of success would have attended them. The great difficulty respecting this, however, was the inadequate means of transport, the only method of communication or outlet being by a river full of rapids or by cooly-back, and there was another great drawback in the circumstance that the experiments in the better districts could not have the indispensable European supervision without considerable inconvenience, and, perhaps, danger to them. The reason for the collapse of the Company, Mr. Fairhurst continued, in reply to an enquiry by his questioner, was the high cost of production, this being accounted for by the difficulties of transport, high wages both to Europeans and Chinese, and the heavy Chinese export duty, which averaged something like 20 per cent.

A New Company.

The Anglo-American Direct Tea Trading Company (Limited), was registered at Edinburgh on November 26, with a capital of 1,250,000*l.* in 10*l.* shares, to acquire and take over as going concerns the businesses of Sherman Brothers & Co. and Hubert Galt, of Chicago; A. R. Robertson, of New York and Boston; and Steel, Hayter & Co. and the Monsoon Tea Company, of Toronto, Canada, and to carry on the said businesses; also to acquire 5533 10*l.* shares in Rogivue & Co. (Limited), and the tea, coffee, cocoa, and cocoanut estates in Cachar, Assam, Southern India, and Ceylon. The first subscribers are :—James Marr, 75, Montgomerie-street, Glasgow, clerk; Donald Love, 5, Grantly gardens, Shawlands, Glasgow, accountant; William Russell, 10, Melville-street, Pollokshields, Glasgow, clerk; J. Brown, 170, West Princes-street, Glasgow, clerk; D. Higgins, 121, Kenmure-street, Pollokshields, Glasgow, clerk; D. M'Pherson, 13, Ardgowan-street, Greenock, clerk; and P. Walker, 256, Renfrew-street, Glasgow, clerk. Registered office, 22, West Nile-street, Glasgow. The "private and confidential" prospectus issued, includes in the directorate Sir John Muir, Mr. W. A. Coats (of J. and P. Coats, Limited) and Mr. Robert Scott (of Messrs. Morgan and Scott, publishers of the *Christian* newspaper). Six banks appear as sponsors for the venture, and the Consolidated Tea and Lands Company, the Amalgamated Tea Estates Company, and the Kanan Devan Hills Produce Company, Limited, "have arranged to apply for and accept an allotment of" certain shares. This last provision is criticised by a shareholder in the three companies concerned, who protests "against the deviation from their original objects and methods of trade, *viz.*, the cultivation and manufacture of tea, to become promoters and partners, in England and elsewhere, of wholesale and retail tea traders." "The three companies," he continues, "are paying satisfactory dividends, and so have no financial excuse for a new departure. What is the tea trade coming to? I have no suicidal thoughts, but the soliloquy of a great Shakespearian character forcibly occurs to me 'Farewell! Othello's occupation's gone.'"

LETTERS TO THE EDITOR.

OUTTURN OF PARCHMENT.

Sir,—In response to your correspondent "Verite" I write to say that "Kartary's" statement astonished me also.

Most planters say they get a bushel of parchment from 2 bushels of cherry. Their cherry bushel is of all sizes, and not all call them boxes, as is done in Ceylon. I have often noticed that in measuring cherry, the measure is allowed to overflow and odd handfuls at the bottom of a basket chucked in; particularly so, when contract picking is on and the planter is not willing to give the extra handful to the next picker.

Here are some Ceylon figures for a normal season :—

"A *standard bushel* of cherry turns out 45 to 47 per cent. of parchment; *a box* (14 *in cube*) turns out 52 to 60 per cent."

Here are some figures I obtained from a careful test in season 1897.

192 bushels cherry = 73½ parchment. My conclusion was that 2 60 bushels of cherry required to give one of parchment dry enough for pounding out or about 40 per cent. only, against Ceylon 45 per cent. I measured the cherry struck and fresh. The least amount of heaping will make a difference.

I found it most difficult, on account of the popularly conceived idea of 2 bushels cherry equals one of parchment, to get a club of small native cultivators to accept 40 per cent. as the correct outturn, until the matter was proven to them beyond all question.

There is another popular error that needs discussion, *viz.*, "Parchment coffee increases in quantity as it dries."

I have found from careful tests that it does not, and will publish some figures I have later on, if the matter excites interest, as I am sure it will do.

There is a slight increase the first day or two after washing and measuring, but this increase soon changes to a decrease as the drying goes on. I feel almost sure I shall be told that I was robbed, but I took all precautions against this in the tests I made.

Glendale, Coonoor,
29*th Dec.* 1898.

Thos. Brown.

Sir,—In reply to "Bushel Measure" in your issue of Decem-

ber 17th, I herewith send you the result of 10 bushels (struck) as requested by him.

Parchment	=	4	Bs.
Light	=	$\frac{1}{2}$	,,
Tail	=	$1\frac{3}{4}$	,,
Total...		$6\frac{1}{4}$	Bushels.

This is better than "Kulla Kumbup" "Boxes." The K. K. correspondent to the N. N. should have stated *what* his "Box" was.

In any case I maintain that to get only 50% from "Boxes," whatever their size, is "bad" and *not* the fault of the "Cherry."

KARTARY.

SIR,—I see by Verite's statement in your issue of the 24th December that he measures the cherry "piled" and the parchment "struck" with the Imperial bushel measure. I know of several planters who do the same. The former method of piling cherry is very erratic, for the simple reason that no two bushels so measured are alike, sometimes holding more and sometimes less. If planters are to compare the outturns of their coffee, one uniform method must be settled on and adhered to. In my humble opinion the struck system should be adopted for cherry, wet parchment, dry parchment and tails. With this measurement I find that my cherry gives an outturn of $\frac{7}{19}$, that is 100 bushels cherry give $36\frac{16}{19}$ or thereabouts of wet Parchment, a rather poor outturn, due, no doubt, to the scanty rainfall during the south-west monsoon. The outturn of Shevaroy cherry is generally $\frac{8}{19}$.

Yours faithfully,

OAK.

YERCAUD,
27*th December* 1898.

LIBERIAN COFFEE AND LEAF-DISEASE.

SIR,—I gather from your remarks and quotations under the heading of "Coffee Hybrids" that one of the advantages of crossing the Arabica variety with Liberian coffee is the possibility of producing a hybrid which is not attacked by leaf-disease on account of the supposed immunity of Liberian from this disease.

I have seen Liberian growing in an irrigated coffee estate near Bangalore, also in Travancore, suffering from leaf-disease. Also in Selangor I have seen a Liberian coffee nursery impregnated throughout with leaf-disease. I venture to make these observations as I have heard so many planters state that Liberian coffee is not subject to leaf-disease.

ALORKOP.

[It is not asserted, we think, that Liberian is immune from leaf-disease, but merely that it is less susceptible to disease than *Arabica*. ED. *P. O.*]

CHEESY TEA.

SIR,—I have always held the opinion that this objectionable flavour in Tea is not always the result of the wood of the chests.

It has by brokers been often *correctly* attributed to *burning*. It will be observed that this flavour is got by tea that is binned in a room to which the steam of the drying room has access, but the most general cause is *Under fermented and Low Fired Teas*. Such teas never keep long and always go cheesy. I am, I fear, making a most startling and novel statement, but I am fully convinced that I am correct, and invite careful trial and close observation, such as I have gone in for.

THOS. BROWN.

GLENDALE, COONOOR,
29*th Dec.* 1898.

TEA BOXES.

SIR,—I fully endorse all that is said of "Venesta" tea chests by Mr. John Hill and published in *Planting Opinion* of December 10th, 1898, and must add that the tea lead reached me in so crumpled and damaged a condition that I had to reject it and to use the ordinary lead (4 oz. to the square foot). I took the precaution of covering the pine-wood battens with lead-foil to prevent the tea becoming tainted.

I sent my break forward in dry weather with great care and cautioned the Agents to handle the boxes with great care, as I was afraid of the middle of the corners bursting, there being no battens there to prevent this. The break arrived in London in excellent condition. The tares were beautifully even, and the cost of bulking saved, but there was no particular advantage. The cost of the chests was high, the anxiety and trouble great.

In putting the chests together, the clamps for 3 of the 4 sides are easily put in and rivetted, but the fourth side and the tops and bottoms is another matter. The clamp comes over at an angle, and to drive the points in square is an impossibility.

It may interest your readers to know something of the lead-foil used for Venestas. It weighs about 2 oz. to the square foot against the usual 4 to 5 oz., resembles the thin stuff over chocolate preparations and is most easily damaged by the cooly.

It is claimed by the makers of "Venestas" that the cement used for binding the layers of wood together is impermeable by damp, but I have a plank in which the layers have parted company, and I saw a chest *en route* belonging to an exporter in which the parts of a plank were opening out. I am glad my break did not go forward in wet weather!

THOS. BROWN.

GLENDALE, COONOOR,
29*th December* 1898.

GENERAL ARTICLES.

RINDERPEST.

With reference to "B's" letter in our last issue, General Morgan, of Ootacamund, sends us the undernoted memo. of a probable cure for Hydrophobia, Murrain, Pleuropneumonia, Anthrax, Cholera, Plague, &c., remarking that on one occasion he lost 50 head of cattle and on another 20 head, some of them valuable animals, that would have been saved had he then known of the remedy referred to in the following :—

A PROBABLE CURE FOR HYDROPHOBIA, MURRAIN, PLEUROPNEUMONIA, ANTHRAX, CHOLERA, PLAGUE, &C.

Some two years ago my cattle were attacked by Murrain, and I lost a dozen valuable cows and six Australian calves. Six other animals also contracted the disease, and their immediate death appeared certain.

Having heard that a raw preparation of the meat of a diseased animal, macerated in water of a temperature of about 65°, internally administered, was a certain cure, I resolved to try it. For each head of the diseased animals one pound flesh was cut off the buttocks of one of the animals that had died of murrain and macerated in 11/12th quarts of water of about 60° temperature.

The liquid was then strained from the meat, and one quart administered to each sick animal. Of six thus treated, five animals recovered at once, but the sixth, an Aden bull, died, the disease in this case having advanced too far to permit of the remedy taking effect. Five other animals had not been attacked, such of these as were full-grown, had a quart of the preparation administered to them, the calves being given a pint each. None of these animals contracted the disease.

Some milkmen residing in Ootacamund were advised to try the remedy. They did so, and saved their animals, which were then daily dying of murrain.

The method of preparing and administering the remedy is as follows :—

For every twelve head of cattle to be treated, 12 lbs. of meat should be finely divided, and macerated in thirteen quarts of water about 65° temperature, for a quarter of an hour. The meat should be taken from an animal that has not been dead for more than 24 hours. The fresher it is, the better. The liquid having been strained off, one

quart is to be administered internally to each adult animal, and one pint to each calf

All animals that have been in contact with the diseased ones, should also have the remedy administered to them. Such animals as have recovered, should be fed on bran mashes or rice conjee till able to graze again.

The theory apparently of this treatment is that the bacillus of incipient putrefaction has power to overcome and destroy the bacillus of disease.

There seems to be something after all in the Homeopathic motto of '*Similis similibus curantur.*'

The probability is that the application of this remedy would be efficacious in cholera, or the bacillus of the flesh might be isolated, cultivated in a suitable medium and given *internally*. Inoculation at times is both uncertain and dangerous in its action, *e g.*, in Hydrophobia and in the case of salted horses and cattle in South Africa. A good salted horse may cost from £60 to £120, and this is due entirely to the great number of casualties during the operation of 'Salting.' If the lungs of the diseased animals were macerated in water, and the resulting liquid given *internally*, there probably would be but small loss

The application of this remedy with such modifications as experience might render necessary, would doubtless prove of value in the treatment of many diseases for which at present, inoculation is considered the best treatment.

It is just possible that the bite of the much dreaded Tsetse fly might be cured by this treatment.

The more widely this remedy is made known, the better I trust it will be for mankind, and the animals that serve it.

Report of 1896-97 :—

By Vet-Lieut. Edwards.—'Subya treated 25 head of cattle of which 23 recovered and two died.'

"SENSIBLE QUALITIES" OF COFFEE.

IN a book published in England in 1815 the author describes a new method of roasting coffee "with closed instead of open cylinders," and states that in conducting this process he has no occasion to employ any art to give it an artificial lustre or gloss, as practiced by those who prepare a pretended patent coffee, and others. It is further stated :

Coffee when tasted after being roasted is somewhat bitterish, with a degree of unctuosity and farinaceous roughness ; it possesses in this state little or very trifling smell, and this renders it so easily counterfeited by employing the process of roasting or torrefaction to other farinaceous substances. As its smell arises from its aromatic part, so it is more prevalent a few days after it is roasted, for being put into a cask or canister (though the former is the best) a most beautiful and exquisite flavor and smell is discovered upon the lid being removed after the first or second day, and it is partly lost by being kept longer than three or four months. To have its proper flavor, therefore, coffee must or ought to be used in the course of a month or six weeks after roasting, or at least so soon as it is reduced to a powder, though. when lost, the smell may be again restored by roasting, or rather warming it anew, a proof that only a part of the aroma is evolved by the process. These sensible qualities coffee gives out in any menstrum in which it is infused, though in aqueous infusion or decoction is the form most commonly preferred both for domestic and medicinal purposes.

The notion that the aroma of coffee requires days for development is contrary to the now current belief that coffee loses in aroma from the moment it leaves the cylinder, and that it should always be fresh roasted, fresh ground, and fresh made, if a perfect cup of coffee is desired. Nevertheless, we are inclined to think that the writer quoted is not very far wrong, and that the flavour of coffee gains as much as it loses by a delay of a few days after roasting, provided that it is properly stored.

LIMES AS SHADE FOR COFFEE.

A South Sylhet writer recently referred to the lime tree as having a voracious appetite, and great ramifying power in its roots. A Dibrugarh correspondent comments on this in the *Planter* as follows :—

Now my little experience with coffee growing under lime trees happens to be quite the opposite of the above. I do not mean to insinuate, for a moment, that I know anything at all about growing coffee compared with your South Sylhet correspondent, or that he is wrong in putting the blame of the poor-looking coffee bushes, down to their immediate proximity to the gigantic lime ; still the following is fact, and "facts are chiels that winna ding, an' downa be disputed."

Some two-and-a-half years ago I planted up a good number of coffee plants in my compound, and one of them, belonging to the gigantic Liberian variety, was planted so close to a large lime tree that in digging out the hole for the plant, quite a solid mass of white roots was displaced. Some fresh soil was put into the hole and the plant was planted. Now at the present moment this is the finest plant (and there are some splendid specimens) in the whole of my compound, being exactly twice the size of any of the others, and by far the healthiest looking plant among them.

Its leaves are of a dark glossy, green colour, while the leaves of the other specimens are, now since the cold weather started, of a yellowish green colour. All the other plants in the compound have been in a dormant state for some time, but such is not the case with this extraordinary phenomenon, as it still continues to throw out shoots ; how long it will go on remains to be seen ; but I have already had to cut away half of the lime tree to allow of its expansion. I was of the opinion that the lime tree had something to do with this plant, and was inclined to hug myself over having made a valuable discovery, and fully intended keeping it to myself until I read your South Sylhet correspondent's article, after which I commenced to have some doubts on the matter, and to think with a touch of sadness that, perhaps, after all, something else was responsible for the extraordinary growth of this one plant.

THE FLORIDA VELVET BEAN.

Apropos of Mr. John Cameron's recent remarks in Coorg, in the course of which he included the Florida Velvet Bean in his test of bye products, we quote the following letter to *Indian Gardening* from the pen of Capt. E. A. Wilson, Orlando, Fla :—

SIR,—As many of your readers in your section are largely interested this season in growing the new forage crop—The Florida Velvet Bean—and as I have had a wide experience in its culture, I want to give them some points that will be of great value to them.

When it is possible it is always better to give the growing vine support, and keep pods off the ground, thus largely increasing fruitage. To do this it is a good idea to mix corn with your bean seed, and the vine will climb stalk, giving it the necessary support. A full, well developed crop will give you from twenty-five to thirty bushels to the acre.

The green forage is eaten ravenously by all stock on your farm, but I would not continue stock on it steadily for more than a week or so at a time, owing to its 54 per cent. of nitrogen. A few days off to other feed occasionally would be advisable. Should you want to sacrifice your bean crop you can cut vine up at any stage of growth and cure it as hay. All farm stock will eat it greedily ; or, what would be better, plant a field later, which you could use as a green forage for a time, and finally cut and cure as a dry fodder. A good average acre will yield you nearly four tons of dry feed

Plant your seed early in spring and when bean is ripe in the fall, pick it; but be very careful to place pods in an airy drying place—a scaffold is best—for fear of heat or mould. Most all your stock will eat the beans, hull and all, but it is better to have them ground up with hulls and feed equal parts of bran or shorts. This is an excellent feed for all stock, and especially for new milch cows, increasing the flow of milk largely.

After picking your bean in the fall you will most likely want to turn your dry leaf and vine under for fertilizer. You will find vine exceedingly tough, and plough will not break it. In a dry, hot sunny day, run over field with a harrow, before ploughing, and this will break the vine completely.

Now comes the important part, the shelling. You will find the pods wonderfully tough and leathery, and exceedingly hard to shell, and they can only be shelled at all, excepting when pods are crisp dry from exposure to sun, and even then, they often shell hard. If you want to practise economy and use your muscle freely, you can shell them fairly well by placing pods in a bag, and pounding them with all your might with a bludgeon. In this way a good strong man will pound out six or eight bushels in a day. With us we have passed beyond that stage, and have found a better way. We have a sheller—a two men machine—made specially for the business, that is capable of turning out from five to eight bushels an hour, the bean coming through 98 to 99 per cent. commercially clean. This is a labour saver to us, and one we appreciate, as many of us have as we do, from ten to eighty acres of beans to shell.

The Florida velvet bean is the coming forage and fertilizing crop of the country, there can be no question, and as a fertilizer, and an upbuilder of overworked land, there is nothing that begins to equal it. It has grown steadily in popular favor here, and men who commenced to grow it in a small way, are now growing from fifty to eighty acres. It is certainly the finest all-around forage, feed fertilizer and shade for the sunparched soil that can be placed upon the farm.

The United States government recognizing its great value to the country as a phenomenal forage and fertilizing plant, the Secretary of Agriculture placed an order with the writer for a carload, which was shipped July 26 from crop of '97 for general distribution to the people of the forty-five States of our Union.

With us it has been on trial for several years, but it is having a broader test the present season, as I have sent it on order to all the States of our Union, to Honolulu, Canada, the nineteen Central and South American Republics, Australia, England, Ireland, Scotland, France, Germany, Italy Egypt, and to far away China and Japan.

Should your readers want further information if they will send stamp I will cheerfully reply.

COFFEE AND CO-OPERATIVE AGENCY.

The *Madras Mail* says:—In connection with the Resolution passed at the last Committee Meeting of the Shevaroy Planters' Association, regarding co-operation for the promotion of sales of coffee direct to the consumer, the Chairman of the above Association. (who, we understand, was the drafter of the Resolution), sends us the following rough sketch of a plan, which might form the basis for enlargement and discussion:—

1. That a Co-operative Society—which may be called "The Pure Coffee Supply Association"—be formed of South India Coffee Planters, who should *all* be invited to join, by taking shares, which if subscribed for with moderate unanimity should give the necessary capital. Each share to be of the value of Rs.100.

2 This Association, conducted by an elected Indian Board, will make the offer to a well known London Firm of Merchants, to act in every particular as the Association's Agents; their remuneration being a fixed percentage.

3. The Firm accepting the business, would as soon as possible open in London small retail shops, under its own management, for sale of pure coffee, raw, roasted, ground, and in the essence, and would employ, in the first instance, say a couple of trustworthy and energetic travellers to push the article with retail grocers outside of London.

4. Catching advertisements should at once be inserted in the leading papers and magazines, and posters be placarded everywhere possible.

5. Growers consigning their produce would be paid for this at current London market rates, for each class of coffee sent to the Association for sale.

6. Profits at the end of each year (or half-year) to be rateably proportioned to each shareholder, the limit of a holding, in the event of a demand, being fixed at, say, 20 shares.

He says:—"I presume much could be done with a capital to begin with of, say, 1½ to 2 lakhs of rupees, which I think is not too large a sum to ask of South India Planters. The Board of Directors might at first be constituted of the present Committee of the U. P. A. S I., until the scheme has been put on a workable basis, when a properly elected Board of Share-holders would take over the concern. The firm of London Merchants, who would be asked to act as the Association's Agents, should be one of good standing with a thorough knowledge of the coffee trade in all its details, and their remuneration ought to be fixed at a figure which would pay them handsomely—especially when the confidence of planters has been established and the volume of business is increased. Small retail shops should be opened in London and its suburbs under competent salesmen, who should be thoroughly conversant with the best system of roasting, grinding and the preparation of the pure essence; and these shops should be provided with the most lately improved machinery for carrying on the above-mentioned processes. The travellers should have large samples placed at their disposal and should be men who appreciate and could therefore prepare a good cup of coffee, when occasion arises, for the fullest amplification of the benefits to be derived from drinking the pure unadulterated article. The system of advertising should be very thoroughly carried out and ought to be the very first step taken. Planters would, at first, probably consign only small shipments, but once the business was set agoing a larger volume of transactions would take place. And here arises the question of realisation on consignments, for the planter also cannot wait; there will be, to my thinking, no difficulty in selling drafts against Bills of Lading through curing or shipping agents. In conclusion I see no reason why the tea growers of South India also should not join in the suggested Association, for the sale of their teas could be carried on in the contemplated shops, with much advantage to the producer and consumer."

Mr. J. Chas. Large writes under date Yercaud, 28th Dec.:—

SIR,—Referring to your article of the 13th and 22nd ultimo commenting on the Resolution passed by the Shevaroy Planters' Association regarding pushing the sale of Indian Coffee in the Home market, (for which you deserve our thanks for pointing out the difficulties to be overcome in the project if ever matured), I wish to make a few observations. It is perfectly true that the production of Indian coffee is comparatively small compared to that of many other countries, but, at the same time, it is of far superior quality to other coffees and as such it goes into consumption principally in England and France; and I contend that if we can sell it pure to consumers at something under the price they have to pay at present, we should do a good business, and probably also be the means of reducing retailers' prices, which would again act in increasing consumption, the object aimed at. Granted, our efforts to push the article would probably stimulate rivalry, but of this we need not be a bit afraid, as the more pure coffee of all sorts is pushed into consumption the better for all planters, as a rise of price of the commoner kinds consequent on this would most certainly improve the position and price of Indian; and the more the taste of the public is gratified with pure coffee the less would they be inclined to buy the adulterations they have been accustomed to. Is it were not for these adulterations there would be even now probably not enough coffee to go round. I think it was in a late number of *Planting Opinion* that it was stated that out of 10 samples of coffee seized and analyzed in the United States, only three samples were found to contain any coffee at all, and these three had only a small proportion of coffee in them, the rest being composed of roasted wheat and other cereals, and the same thing goes on probably to a like extent in Europe. The coffee required to take the place of these adulterants (if they could be stopped) would at the very lowest estimate double the consumption of pure coffee, and by co-operation we could give the public pure coffee at the same price that they pay for that rubbish. The Indian and Ceylon tea planters, with their indomitable energy in pushing their packet teas into consumption, bid fair to turn the people of England into tea drinkers to the exclusion of coffee entirely, unless we do something to retain at least the present coffee consumption. I note, too, that cocoa is being

actively pushed and increasing in favour, but coffee is declining. I admit it is a big project and requires considerable capital and judgment to carry through, but if every coffee planter in South India would take shares in such Co-operative Association, it would, in my opinion, be quite practical and we should reap the benefit in soon realising very much higher prices for our staple than we do at present. I brought forward the subject for discussion in the hope that it would be threshed out by the different Associations, and did not deem it necessary to formulate any special plan, the Committee of the U.P.A.S.I. being much more competent to do this.

P. S.—Since writing the above, I have just seen your issue of the 29th ultimo containing the rough sketch of a plan by our Chairman, which I generally agree with.

CINCHONA IN JAVA.

A CORRESPONDENT lately sent the following to the *Pioneer*:—Monsieur Chailly Bert in his article in the *Revue General edes Sciences* intended to show the extent to which the Buitenrzorg Institute of Research in Java has served science and horticulture, omits to mention one of the most celebrated and the most successful efforts of that institution, namely, that connected with the introduction and establishment of the cinchona enterprise in the island by the joint labours in 1853 and 1854 of Professor Reinwardt and Herr Hasskarl, the Director and Botanist, of the garden at that time. The latter by a long residence in Java had become accustomed to the influences of a tropical climate, and seemed to the Director to be the best person to send to South America, whence the valuable variety of the quinine-yielding cinchona was to be obtained. He started on his hazardous journey on the 4th December, 1852, and arrived at Panama on the 14th of the following month. It was not till May, however, that he descended into the lower part of Peru. The roads there were found to be bad with dangerous precipices on one side. When the crest of the second Cordilleras was passed, the traveller had bad roads exchanged for worse steps. At Monohomba and Uchahamba, the first quinine trees in the natural state were met with, but they were not calisayas, which are only to be found in South Peru and Bolivia not in groups, but scattered all over the forests. This circumstance, only ascertained on the spot, altered the direction of Mr. Hasskarl's journey and he went towards Cuzco, the old Inca town, and thence ultimately to Sandia, which he made his head-quarters for a time. Before coming to Sandia, he was confronted on the way by a serious difficulty. Peru and Bolivia were at war in 1853, and the frontiers of the former were forbidden to travellers. But although Peru could not be entered, Bolivia was accessible, and the bark of Bolivia was the quinine bark *par excellence*. Moreover, the Cascarilleros, the collectors of the bark, were Bolivians, and it was by them that he was supplied with both plants and seeds in return for provisions and strong drink. The number of plants thus secured was 400 and with this precious burden Mr. Hasskarl traversed 150 leagues to bring it to a port of shipment. The plants had to be conveyed so as to reach the coast without drying up in the day when it was hot, and without freezing at night when it was extremely cold; and to avoid these extremes the sprigs were closely packed together with the roots in damp moss—then wrapped in Pisang stalks and sackcloth, and hurried by the party without interruption to leave behind the hill country with its extreme changes of temperature—and to get as far off the highway as possible, that the cavalcade might incur no risk of being challenged by troops, who took charge of all transports, as contraband of war. It appeared at one time as if the strife of the two Republics would occasion the failure of the mission, but after going through innumerable difficulties and overcoming many obstacles the Botanist at last arrived at Ariquipa and thence embarking he went by Islay to Calcutta and then direct to Java. On the long voyage he unpacked the bundle of plants and was surprised to find that although four weeks on the land journey they appeared to be fresh—and he planted them in cases. On the voyage by the Cape, the temperature was high and the cuttings began to shoot out, but many died. It was on the 13th December, 1854, that Mr. Hassakarl arrived at Batavia with 20 cases of cinchona plants and was forthwith charged with the exclusive duty of cultivating them.

Mr. Hasskarl's labours had been both before and after supplemented by those of others in various ways, but his formed the nucleus of the Java cinchona enterprise; and the soil, the air, the light, the warmth, the dampness and other atmospheric conditions of the locality chosen have perfectly suited the plant. Indeed it was seen that it could hardly be otherwise, as Java is situated in about the same latitude as Bolivia, and has not dissimilar volcanic surroundings.

Of no agricultural or horticultural undertaking can the result be predicted as certain. The whole system consists of exchange or transplantation of plants from one place to another This holds good of Europe as well as of the tropics. The cultivation of exotics in Java, such as coface indigo, vanilla, coffee, rice, besides cinchona, bring in large sums annually to the treasury, and most, if not all of these, have been introduced to the island by the Research Institute, which allows its humanitarian efforts to be hidden under a bushel—or at most to be spasmodically revealed to the world by some lingually accomplished foreign winter tourist.

The Dutch have had possession of Java for over 300 years with a short interregnum by the British, and have pursued a system of administration at once prosperous to the people and profitable to Holland. It covers an area of 50,000 square miles and the population numbers 24,000,000. The natives are governed just the opposite of the way we employ with natives in India, yet the Japanese are happy and contented.

The Java cinchona controls the market for this drug the world over—and the efforts of its consciencious experts should not be untold.

STRAY NOTES CONCERNING MANURES.

NITRATE OF SODA.—A resident of the Benalla district, South Australia, has just concluded some experiments with nitrate of soda in the cultivation of wheat, oats, potatoes, &c. In the case of the two cereals mentioned magnificent yields were obtained, being nearly 50 per cent. better than those obtained from plots of the same land which were not treated with any kind of manure. Similar results were secured from an area of lucerne and red clover, thus proving the value of the nitrate as an artificial manure.

* * *

LIME.—It is well-known that lime is a valuable agent in correcting the sourness of land, in unlocking the unavailable potash, phosphoric acid, and nitrogen in the soil, and as a general soil improver. Many plants are benefitted by the application of lime to the soil, but some are injured by it. Experiments made at the Rhode Island Experiment Station show that onion, parsnip, celery, cauliflower, spinach, lettuce, beets, asparagus, cucumber, cabbage, turnip, peas, tobacco, and kohl rabi are benefitted by its use; that carrots, potatoes, millets, Indian corn, and rye are indifferent to liming; that watermelons, sorrel, and blue lupines are positively injured by the use of lime. Lime is especially valuable to land that has been continually heavily dressed with stable manure, and which is showing signs of being less fertile than formerly.

* * *

MANURE PRESERVATIVES.—About the stable and the compost heap much valuable ammonia escapes and is lost. This can be largely prevented by the application of materials which will absorb and hold the volatile gases. Possibly the best and cheapest is dry earth containing a considerable quantity of humus Every farm has plenty of this, the only cost being the placing under cover. Gypsum or land plaster is highly recommended, but its influence is not very marked. Sprinkle the absorbent over the manure pile and about the stalls when the stable has been cleaned. Disagreeable odors will be prevented and fertility saved.

* * *

SHALLOW COVERING.—Farmyard manure should be kept as near the surface of the soil as possible. The rain water as it percolates through the soil has a tendency to carry the soluble plant food downward and out of the reach of plants. Consequently an attempt should be made to delay the downward progress of plant food instead of assisting it by plowing the manure in deeply Then again, nitrification is most active near the surface of the soil.

Therefore, manure kept near the surface is under more favorable conditions for having its plant food made available and consequently gives quicker returns.

When a heavy application of manure has been ploughed under deeply, it is no uncommon thing to see lumps of manure brought to the surface by subsequent ploughing, showing that it had never become properly incorporated with the soil. It is quite probable, too, that this deeply buried manure has lost considerable nitrogen through dentrification. Economical manuring consists in obtaining quick returns over as large an area of the farm as possible, and this is accomplished by moderate applications incorporated with the surface soil. Shallow covering of manure also increases the humus of the surface soil. As a result, the soil does not bake and crack in dry weather; it absorbs and retains water much more satisfactorily and works up into a fine tilth more easily.

* * *

POTATO MANURING EXPERIMENTS.—The *Indian Gardening* records the comparative results from a series of experiments conducted by the Highland and Agricultural Society of Scotland at its experimentalgrounds, in order to test certain conclusions arrived at by M. Ville, the well-known agricultural chemist at Vincennes, to the effect that the omission of phosphoric acid greatly diminished the potato crop, and that it was still further reduced when the nitrogen was left out, while the greatest reduction of all took place when potash was omitted. The experiments undertaken by the society in question are described as fully bearing out M. Ville's conclusions, the neglect of potash in the manure resulting in a marked decrease in the yield of the crop. The best manure to apply to potatoes was found by these experiments to be superphosphate at the rate of from 3 to 6 cwt.; sulphate of potash or muriate of potash at the rate of from 2 to 3 cwt., and sulphate of from 2 to 3 cwt. per acre, when they are grown without farmyard manure; while with farmyard manure a smaller quantity of the same artificials is very beneficial, also that all three manurial constitutents must be added to the manure to ensure good crops of potatoes, the most important being potash. The benefits resulting from the addition of potash to the manure were not merely confined to the increase in the amount of produce, but were also seen in the increased size of the tubers; those manured with potash giving 16.7 per cent. of large tubers more than the plots without potash. Field experiments.—Results on plots measuring 125 square yards each:—Without manure, yield 275 lbs.; incomplete manuring, (nitrogen only), 354 lbs.; incomplete manuring, (Phosphoric acid and potash), 411 lbs.; complete manuring, nitrogen phosphoric acid and potash 541 lbs.

THE INDIAN TEA ASSOCIATION.

A Meeting of the General Committee of the Indian Tea Association was held at the Royal Exchange, Calcutta, on the 5th ult.:

The London Secretary forwarded for the opinion of the Committee, copy of a letter addressed to his Committee by Messrs. Alex. Lawrie & Co., on the subject of tea blights in which they referred to "The pests and blights of the tea plant" by Dr. Geo. Watt. They specially drew attention to a blight named "the grey blight," which, according to Dr. Watt, is one of the most destructive and dangerous of blights to which the tea plant is liable. As there was no good remedy known for this disease, Messrs. Alex. Lawrie & Co. had suggested that the Calcutta Association should take up the question of appointing a scientific expert to investigate blights.

It was decided by the Committee that a communication should be addressed to the Assam Administration on the subject, enquiring if Government could see their way to assist the Association with funds, with a view to the appointment of such an officer.

The first Meeting of the Joint Committee of members of the Indian Tea Association and the Ceylon Association to consider the subject of duty on tea in England was held in London, when the question to agitate for a reduction of duty on tea was thoroughly considered. Considerable difference of opinion was expressed as to the advisability of any action being taken, as it was pointed out that the present tax of 4*d.* per pound on tea constituted a heavier imposition on China than on British grown teas.

It was ultimately resolved that, as the Ceylon representatives had received no instructions on the subject from Ceylon, it was inadvisable to take any action at present in the matter.

Considered letters of 21st and 28th October, and 4th November, from the Secretary, Indian Tea Association, London, in connection with the American Market Fund.

Mr Blechynden, who advised his arrival in New York, reported that business, so far as tea was concerned, appeared to be absolutely dead for the present. The reason was owing to the uncertainty as to the duty question, an agitation being on foot to remove the war tax now that peace had been proclaimed. He considered that until something definite was known there was small chance of revivifying the business.

Mr. Blechynden again brought forward the question of the manufacture of "Oolong" teas in India, as several enquiries had been made on the subject. He urged that systematic experiments should be made with teas of different districts, so that the Indian Tea Association could get some of the trade that Ceylon was pioneering. He considered that "Oolong" teas would be used as substitutes for higher-priced Japan teas and would go in blends with China teas, and he thought that although these teas might not sell for use by themselves at first, that might come after experience, and the gradual education of taste, by the blenders increasing the use of these teas.

The General Committee, after considering this subject, were of opinion that it would not pay the great majority of gardens to go in for "Oolong" teas. One firm had sent samples to New York which were approved, but when rolling with machines was tried the quality was much inferior to the sample made by hand. This firm had, however, sent a shipment to America. It was generally agreed that "Oolong" teas might be satisfactorily manufactured with hill teas, but it was impossible with teas grown on the plains. Some firms were making experiments with a view to see if they would be likely to succeed in the manufacture of this class of tea.

The Secretary was instructed to inform the Secretary of the London Association that one or two firms were trying to make Oolong teas, and that a few small shipments had already been sent Home.

The Secretary reported that the amount of contributions promised to the American Market Fund was Rs.1,02,031-13-6.

BLACK PEPPER.

(*Piper Nigrum.*)

SOME remarks made by one of our correspondents have caused our Calcutta contemporary the *I. P. G.*, to launch out on the subject of Black Pepper. We give its remarks in full, for with a boom in Pepper—or at least a spurt in demand for *Indian* pepper—practically phophesied, some of what is given below may prove of value to our readers:—

A correspondent in *Planting Opinion* would seem to question the possibility of a return per acre of Rs.250 from the above product. So far as we can glean, from both practical and scientific sources, a return of Rs.250 per acre appears not at all to be an over-estimate; rather under if anything. Referring to this product, Dr. Roxburgh has put it on record that the vegetable world is full of proofs that the sexual system of the immortal Linnæus is founded on absolutely sound principles, and that he never found a single plant in India which did not corroborate this fact. The Arabians, from time immemorial, knew that to render the date palms prolific, it was necessary to bring the male and female plants in contact with each other. Still, surprising as it seems, there are thousands of well-educated people who would be incredulous if they were told that there was such a thing as a sexual system existing in the vegetable kingdom. The Malays of Sumatra could hardly have known that the Black Pepper vine was a dicecious plant, or Mr. Marsden would not have neglected mentioning a circumstance so material when describing this plant, and the method of cultivating it there. As a matter of fact, Roxburgh had not met with any other, or any sort of information, that could lead him to think black pepper was the produce of a plant having the male and female on distinct vines.

The *Straits Times*, in an article on pepper-growing, says, when describing its cultivation there, that the lines are laid out 7 feet apart, and the holes dug 2 feet square by 1 foot deep, the centre of the holes being 7 feet apart in line. A post is put down at one corner of the hole having about 10 feet out of the ground. The post should be of such wood as will not be readily eaten by white ants; and some planters use posts of Erythrinæ, which take root and become permanent. It is usual to put three cuttings, 18 inches long, into each hole, in the opposite corners to the post, burying

the cutting six inches deep and for over a foot in length. The cuttings are taken from the tops of the vines and are usually put in a nursery to root before being planted out. The vine comes into bearing in 2½ to 3 years, and is in full bearing when from 6 to 7 years old, but continues to increase year by year if manured and not allowed to overbear itself. Twenty piculs (of 133lbs,) to the acre is considered a fair average crop, and a good crop 28 piculs to the acre.

Black pepper is simply the berries dried. White pepper comes from the ripest berries, which are allowed to lie in a heap for some days to ferment, when the skins are removed by rubbing or trampling by coolies; they are then washed and spread out upon a drying apparatus with a slow fire underneath. It is usually thought that black and white pepper are the produce of different varieties of plants. but they are produced by the self-same variety, the difference being merely in the curing of the berry, as shown above. In order to make the vine throw out laterals and spread, it is topped when about two feet high. Such, briefly, is a sketch of the pepper culture in the Straits, barring manuring, weeding and cost of laying out a garden, which, all included for the first three years, is said not to exceed $100 per acre.

An experienced low-country planter in Ceylon writes as follows in *All About Spices*: "Do not plant unrooted cuttings *in situ*; a very large proportion fails. Raise cuttings in nurseries, the cuttings to be, say, a foot long, and from the stem (branch cuttings useless) six inches to be buried; shade and water according to circumstances. Allow the plants to remain in the nurseries a year before transplanting, harden off by gradually removing shade. In suitable weather remove carefully without earth to the roots, but taking care not to injure those. Plant in holes at least a foot wide by 9 inches deep, and when the vines commence to creep, train them till they adhere to the stem of the tree. For supports, select trees which are not deciduous. Plants raised from seed should be allowed to remain in the nursery until they are 18 months old. For planting, by preference, select localities with an eastern aspect, as observation teaches that vines grow best and crop heaviest in such situations. In raising nurseries of either cuttings or seed, do not use those to be procured in your own district, but get them from some other district, at either a higher or lower elevation. By attending to this the resultant vines will be strong and good croppers" This is said to be the gist of a long series of experiments in pepper cultivation in Ceylon.

The correspondent in *Planting Opinion*, alluded to above, has evidently not had much practical experience in raising young pepper plants when he says: "The difficulty of rearing vines from cuttings or seed is very great, especially with seed, as generally a very large proportion give male, or non-bearing vines." We would point out the indisputable fact that a certain proportion of male plants is absolutely essential to having any crop at all, and the practice of ignorant cultivators in continually propagating by cuttings taken from the female plants is considered by scientists to be one of the reasons of pepper disease. By their continued neglect of the cultivation of the male plant, the latter has lost power and fails in a great measure to properly perform its natural functions. Roxburgh advises having at least one male vine planted in each pit, which would require one-third male plants. The neglect of proper cultivation of the males of deciduous plants is, in a great measure, responsible for the deterioration of their produce, and by weakening the vital power of the plants themselves predisposes them to disease.

Black pepper is cultivated on an exceedingly small scale in Assam, being only grown in a few native enclosures for home use. The Assam produce is considered to be lighter than Bengal, Straits and Malabar pepper, which is, most likely due to careless cultivation. A South Sylhet coffee garden has started to grove it upon the shade trees, and as a by-product it is well worthy of consideration. because as regards production and consumption, it ranks amongst spices as of the highest importance. It is one of the earliest spices known to man, and has for ages formed a staple article of commerce between India and Europe. One of the articles demanded in A.D. 408 as part of the ransom of Rome by Alaric was 3,000lbs. of pepper. In Malabar each vine gives a yield of about 2lbs a year up to the 20th year, or about 24lbs from each tree, a single tree sometimes supporting eight or twelve vines. An acre is calculated to beer 2,500 plants, and to yield a produce of £80 when in its best condition. "Spon's Encyclopædia says that the yield of plantations varies greatly according to circumstances. In Sumatra the dual crop is estimated to average 1¾lb. from each vine per annum. In Malabar each vine gives a mean of 2lb. a year, and sometimes 8 to 10lbs. will be got from a single vine, and that the vine lives for about 30 years.

The article on black pepper in Dr Watt's *Dictionary of Economic Products* does not mention its cultivation in Assam; the only reference made in that article to Assam; is to the effect that black pepper is doubtfully indigenous to the forests of that province. But from enquiries made by Mr. Bhupendra Chandra Basu, Assistant to the Director of Land Records and Agriculture, Assam, it would appear that black pepper does not occur in the wild state in any part of the Assam Valley, but an allied species (*P. longium*), the "pipal" or long pepper, is found. The Assam pepper seed is said to be smaller than the foreign product, which comes through Calcutta. The indigenous article is, however, more pungent and therefore commands a higher price in the local market.

The pepper vine according to the note upon it in the *Agricultural Ledger* is very susceptible to drought, which often proves fatal. Rain and fog during the cold weather cause the leaf to fall off. Hail storms are a frequent source of injury to black pepper as well as other crops in Assam. A species of caterpillar which feeds on the leaves would also appear to cause some damage. When it appears it is destroyed, as far as possible, by hand picking.

The highest outturn that can be obtained from a single vine in Assam is said to be about 3 seers of dry cured pepper, the average yield is commonly reported to be about one seer for each vine in a plantation. The wholesale price runs about Rs.20 per maund, and if we allow 1,000 vines to an acre, this would mean Rs.500, so that a return of Rs.250 per acre is not so much of a "dream" as the correspondent of our esteemed contemporary of Southern India might imagine.

TEA, &c., COMPANIES.

Tea Corporation Limited, (of Ceylon.).—The accounts of the Company for the year ending 30th June, 1898, show results that are not satisfactory.

The Company was formed to take over and work certain estates in Ceylon from 1st July, 1897; owing, however, to legal difficulties and delays in Colombo, which your Directors were unable to control, the estates were not conveyed to the Company until the end of that year. Consequently, for the first half of the period under review the original owners managed the properties on account of the Company, and the result showed, when their accounts were presented, a considerable loss on the working.

As soon as the Directors got possession, they took steps to improve the management and curtail the expenditure as far as possible. and in this they were ably seconded by Mr. Tatham, the Managing Director, with the result that the cost of the tea per lb. F.O.B., was reduced from 42·65 cents. to 25·96 cents.; included in this latter rate is a sum of £1,100 for manure, which under ordinary circumstances would have been spread over the whole year, as well as a large item for weeding and pruning some of the estates which had been neglected. The whole of this has been debited to working expenses.

Although the crop for the first six months fell short of estimates, the production of tea for the year amounts to 1,112,606lb., and the Directors are of opinion, that if Mr. Tatham had had control for the whole of the time, this total would have been materially increased.

The working of the estates shows a profit of £1,701 18s. 4d., after wiping off the loss on the first six months. and charging the whole of the Ceylon expenses. After charging London expenses and Debenture interest there is a loss of £1,620 6s.

The estimates furnished by Mr. Tatham for 1898-1899 are encouraging. He hopes to secure over 1,300,000lb. of tea at a cost of about 25 cents. per lb., and about 500 cwt. of Cocoa.

Spring Valley Coffee Company, Limited.—The crop of tea amounted to 391,400lb., and this, together with 85,080lb brought from neighbouring estates and manufactured at Spring Valley, sold for £16,365 19s. 1d. or an average of 8·24d. per lb., the average selling price last year being 8·40d. per lb. The yield from the 1,045 acres of Tea in full and partial bearing was 375lb. per acre against an estimated yield of 400lb. per acre, and this would have been secured but for severe drought during the latter part of the season which was felt throughout the Island, and more particularly in the Badulla district. The total proceeds from the sale of produce amounted to £17.231 4s. 5d. and expenditure in Ceylon and London was £14,558 2s. 6d. leaving a profit on the year's working of £2,673 1s. 11d. To this profit a sum £691 1s. 4d. has to be added, being the balance brought forward from last year, and after debiting £100 16s. 8d. for Income Tax and £900 for Dividend on Preference Shares to 31st July 1898, there remains a balance of £2.363 6s. 7d. now to be dealt with. The Directors recommend the payment of a Dividend of 2½ per cent. for the year on the Ordinary Shares which will absorb £2,000 of the above sum and that the balance of £363 6s. 7d. be carried forward to next year. During the past season the sum of £7,191 13s. 11d. has been

spent on Capital Account, and recent advices from the Manager on Spring Valley lead the Directors to believe that the whole of the contemplated extensions, both of the Tea area and Factory, will be completed by the close of the present year. The tea crop now being plucked is estimated to produce 499,400lb. of made tea, exclusive of bought leaf, and though the effects of the drought continue to be felt, this yield is still looked for. The latest advices report the estate to be in good order and condition throughout.

Digalla Ceylon Tea Estate Company, Limited.—The net amount at credit of profit and loss account, after providing for general expenses, Directors' fees, Income Tax, etc., is £150 4s. 6d. Dividends on the 6 per cent., preference shares were paid for 1897-98 (less Income Tax) amounting to £348, leaving to carry forward to next year a balance of £1,02 4s. 6d. The Directors regret that, owing to the fall in the price of tea, and the expenditure incurred on the cultivation of tea not in bearing, they are not in a position to pay a dividend on the ordinary shares. The amount expended on tea not in bearing in the past season was £45 , on the factory £900 11s. 3d., and on new clearings £1,248 17s. 10d., in all the sum of £2,599 9s. 1d., which has been added to the capital cost of the estate. The acreage of the Company's property is now as follows:—Tea in bearing 420 acres; tea not in bearing, 99 acres; new clearings, 80 acres; jungle, 151 acres—total 750 acres. The gross average price realised was 6 17d. per lb., as against 6·47d. per lb. last season, and the rate of exchange was 1s. 3·27-32d per lb., against 1s. 33-16d. The total crop amounted to 190,818 lb. or 453 lb. per acre of tea in bearing, which includes 37 acres young tea in partial bearing.

The Carolina Tea Company of Ceylon, Limited,—The surplus of £5,327 13s. 6d. it is proposed to appropriate as follows:—Net profit, £5,227 13s. 6d.; amount at credit of ordinary shares, £110 4s. 7d.; debenture interest £2,450; dividend on ordinary shares at 5 per cent. per annum, £2,500; proposed to place to reserve fund, £275; balance to be carried forward to the credit of the ordinary shares, £112 18s. 1d.

The actual tea crop from the Company's properties was 939,491 lb as against an outturn for the previous season of 893,288lb. exclusive of Bellongalla Estate (sold in 1886-97, and which produces 36,778 lb. tea in that season). The cost of the tea free on board Colombo was 5·10 per lb. compared with 4·88d. per lb. for the previous season, the extra cost being due entirely to the advance in exchange. The average gross sale price in London was 8·02d., as against 8·26d in 1896-97. In addition to the tea crop 441 cwt. of cocoa and 307 bushels of coffee were obtained, as compared with 450 cwt and 413 bushels in the previous season. The reduction of profit shown by the accounts from the earnings of last and previous years was caused mainly by the considerable advance in rates, both of exchange and freight, during the season, and which entailed an extra cost of working equal to nearly 3½ per cent. on the capital of the Company, while the average selling price of the tea was about ¼d. per lb below that of the previous year's crop.

The total quantity of land now under cultivation is 2,577 acres.

The South Travancore Tea Company, Limited.—The outturn of tea was 242,046 lb. being 32,954lb. below the estimate. The area now under tea amounts to 743 acres. The average price realised was 5 55d. per lb., as against 5·85d. obtained last season, the gross profit £1,3 4 15s. 3d., as against £1,672 11s. 10d. last year. The net profit amounts to £740 0s. 7d., which, with the balance brought forward from last year, makes a total of £941 15s. 4d. Shortness of tea crop, unusual drought, high freights, high rate of exchange, failure of coffee, and lower prices generally have combined to produce so disappointing a result. The Directors are of opinion that the capital expended in developing the estates since the formation of the Company will now bear fruit, and that the current year will show more satisfactory results. The latest crop reports show that for the first three and a-half months of the current year 90,000lb. of tea were made as against 54,891 lb. during the corresponding period of 1897, and so much of this as has been sold has realised a satisfactory price. Mr. Valentine, who has recently been appointed visiting agent, reports under date September 23rd, that the garden and factory are in good order, reflecting great credit upon the Manager (Mr. Stewart) and the Assistant (Mr. Macdonald.) Mr. Valentine estimates the probable outturn for this season at 350,000lb.

At the request of the Directors, Mr. Forbes Laurie, early in the present year, visited the Company's tea gardens in South Travancore. His report on the properties, with the exception of two small divisions, was favourable. Negotiations are proceeding for the resale of the latter to the vendor on terms favourable to the Company. During the period under review. 1897-98, Mr. Alexander resigned the management of the Company's properties, and Mr. Stewart was appointed manager in his place.

The Ottery Tea Company of Ceylon, Limited.—Owing partly to unfavourable climatic conditions, and also to a somewhat finer system of plucking, which was adopted towards the end of the season, the crop has been considerably short of the estimated yield, the amount of tea secured being only 152,978 pounds against the original estimate of 170,000 pounds The tea has cost without manure cents 25·05, and has realised a nett average price of cents 42·40. During the year, a sum of £125 has been paid in further reduction of the mortgage, and this, together with the amounts previously paid, and the profit which has been derived from the favorable rate of exchange at which the mortgage has been reduced, has been transferred to a reserve account. From this account a sum of £2,500 has been spent on manure, and it is proposed to provide from the same source a further sum of R1000 during the present season. After making provision for the interest on mortgage, &c., the balance of profit available amounts to R22,9 1·68. Of this sum, R1,864·08 was absorbed by the payment of £125 in further reduction of the mortgage, and an interim dividend of 3 per cent. to March 31st has been paid, leaving a balance available of R12,147·60. From this it is proposed to pay a final dividend of 4 per cent., absorbing R11,920, and to carry the balance R227·60 to next account. At an extraordinary general meeting held on the 24th June, 1898, it was decided that the Directors be authorized to enter into an agreement with the mortgagee to make the balance principal secured by the mortgage payment at twelve months' notice on either side, instead of by annual instalments of £500, and this was accordingly done.

The Dejoo Tea Company, Limited.—The season is expected to close with a crop of 433,600lb. or 13,472lb. in excess of that produced in 1897. Up to the present date 245,710lb. have been sold at an average of 9·17d. per lb. This price is very disappointing, and is due to the want of quality in the tea. The estimated cost of the current season's crop is 8·63d. per lb., or about a farthing, under that of 1897. This high cost, as compared with 1895 and 1896, is due to expenses incurred in the necessary importation of new labour in 1897-8 and higher exchange, chiefly the latter. In consequence of the large quantity of tea yet to be sold, and the narrow margin of profit shown by the average at present realised, the Directors regret that they are unable to pay an interim dividend.

Needham Tea Company.—The Secretaries report the receipt of a telegram advising the outturn to November 30 as follows:—3,360,000lb., as compared with 3,109,840lb. for last year to same date.

Jokia (Assam) Tea Company.—The Secretary reports that the total amount of tea manufactured to the close of the season is 3,815,440lb, as against 3,691,159lb. last year, an increase of 124,281lb.

Jhanzie Tea Association.—The managing agents report that the total quantity of tea manufactured to the end of the season is 937,120lb as against 825,091lb. to the same date last year, an increase of 112,029lb.

Bargang Tea.—An ad interim dividend of 3 per cent. on the preference shares and 3 per cent. on the ordinary shares.

Moabund Tea and Borelli Tea.—These Companies have each declared an ad interim dividend of 2½ per cent. on the preference shares.

Makum (Assam) Tea.—Interim dividend of 2 per cent, being at the rate of 4 per cent. per annum, on account of season 1898, payable on 23rd inst.

The Oodoowerre Estates Company of Ceylon, Ltd.—At the extraordinary general meeting of shareholders of this Company held on Christmas Eve, it was resolved that the Company be wound up voluntarily, and Mr. C. E. Haslop was appointed Liquidator.

"COMPOSITION OF CINCHONA SOILS."

Mr. John Hughes writes to the *Ceylon Observer* under date.

SIR,—In the last *Overland Observer* bearing the date of November 4th, there is on page 1540 a short editorial note under the heading of "Cinchona Bark and Quinine to the Front" in which a renewed attempt at Cinchona cultivation is seriously advised especially in the Uva districts.

Bearing in mind the disappointment caused in the past, through the failure of Cinchona plantations to produce profitable results, it would be desirable and certainly wise to ascertain first, whether the land selected is likely to be suitable for the purpose intended. Also whether the average rainfall is sufficient in quantity and fairly equally distributed throughout the year.

In 1886, for his own information, the writer specially obtained through Mr. R. Thomson, a specimen of soil, from the Central Cordillera of the Columbian Andes, upon which Cinchona Lancifolia were growing and it may be useful to planters if the analysis, particulars of rainfall and situation were made public at the present time.

Mr. Thomson's notes are as follows:—

"The best varieties of Cinchona Lancifolia grow upon this soil, the elevation is 8,000 feet and the average rainfall is about 100 inches. One variety of Lancifolia gave 620 per cent. of quinine, while several other indigenous species of Cinchona in the same locality contained from 1 to 2½ per cent of quinine. The subsoil to a great depth is the same as sample sent, for the immediate surface soil specially rich in vegetable matter was excluded when taking the sample. This subsoil is sandy and porous so much so that after heavy rains the soil quickly becomes perfectly dry. The sample was taken from virgin forest and represents the quality of the soil throughout the entire Cordillera."

The most noticeable points in the analysis are the high figures for natural moisture 4·823 retained in the air-dried sample, and 18·687 combined water and organic matter; showing considerable retentive properties, which are probably due to the decayed vegetable matter present, and also to the apparently large amount of alumina suggestive of a somewhat stiff soil. Mr. Thomson, however, states that the soil is very porous and is not injuriously affected by heavy rain. It is fairly rich in phosphoric acid though the figures for potash are low. In nitrogen, however, this specimen is very rich, the figures being much above what is usually found in soils of average fertility, and as nitrogen is a very important constituent of the alkalords it appears essential that soils suitable for Cinchona should be rich in nitrogenous vegetable matter.

Let us now see how the composition of this soil compares with that of the Indian Cinchona soils, samples of which were kindly supplied the writer in 1882 by the Madras Government authorities:—

No. 1.—Neddivattam, formerly forest land, now planted with succirubras, which are growing very well, average annual rainfall during five years from 1887 to 1882 was 92·41 inches.

No. 2.—Neddivattam, formerly grass land now planted with succirubras and condamineas, the former growing very badly and the latter fairly well.

No. 3.—Dodabetta, rich surface soil, elevation 7,200 feet, average rainfall during five years from 1877 to 1882 was 51·70 inches growing Condamineas and doing well.

No. 4.—Dodabetta, poor gravelly soil elevation and rainfall same as No. 3 growing Condamineas.

ANALYSIS OF CINCHONA SOIL.

From the Central Cordillera of the Columbian Andes in the District of Chaparral.

SENT BY MR. R. THOMSON, 1886,

Composition of the air-dried sample.

Water (lost at 212° F)	4·823
* Combined Water and Organic Matter	18·687
Oxides of Iron	5·752
Alumina	15 406
Lime	·253
Magnesia	·214
Potash	·086
Soda	·091
Phosphoric Acid	·105
Sulphuric Acid	·055
Carbonic Acid	·473
Chlorine	·118
Insoluble Siliccous Matters, Sand, &c.,	53·937
	100·000
* Containing Nitrogen	·364

REGISTER OF RAINFALL AT THE CINCHONA PLANTATIONS, CHAPARRAL.

REPUBLIC OF COLUMBIA.

	1883	1884	1885	1886
January		6·88	5·10	8·62
February		3·25	7·23	5·11
March		15·65	12·50	6·88
April		12·28	18·97	15·90
May		15·25	11·47	
June		9·17	6·89	
July		2·98	2·08	
August		2·30	4·68	
September		5·05	8·47	
October	10·53	12·25	20·67	
November	9·33	6·30	5·84	
December	4·85	5·73	13·32	
		97·09	117·22	

From the above returns, it will be seen that the rainfall is heavy and pretty evenly distributed throughout the year; though March, April, and May, appear to be the months of greatest rain. October, however, seems to be a damp month and in 1885 experienced the record downfall of 20·67 inches.

Evidently Cinchona thrives best in a comparatively damp hot climate with only occasional short intervals of really dry weather.

INDIAN CINCHONA, SOILS.

Composition of the air-dried Samples.

	Neddivattam.		Dodabetta.	
	1	2	3	4
Water (lost at 212° F)	4·560	3·704	3·650	1·580
* Combined Water and Organic Matter	18·580	18·420	16·950	8·080
Oxides of Iron	7·080	9·800	8·510	26·870

PERMANGANATE OF POTASH ...	per lb. ...	1	6	0
Used by the Medical Authorities for purifying wells, drinking water, etc.				

MANURES.

Fish Guano. Steamed Bone Meal. Poonac:—Castor, Mowra, Hoongay. **Saltpetre, Crude and Refined** (Nitrate of Potash) **Nitrate of Soda. Sulphate of Ammonia. Sulphate of Potash. Muriate of Potash. Superphosphates. Phosphate Powder. Kainits Salts.**

Mixtures can be made in any proportion without extra charge. **Packing** can be done to suit transport by bullocks, etc.

Prices will be furnished on application for delivery either at our Karaparumba Works, Calicut, the Calicut Railway Station, Palghat, Mettapollium, Salem, or at our godowns in Cochin, Tellicherry, Mangalore and other places.

Quotations will be obtained and orders booked for any Manures not kept in stock.

F.r.m.

It will also be noticed that the best soils namely, No. 1, from Neddivattam plantations and No. 3 from Dodabetta plantations, are both of them much richer in lime, potash and phosphoric acid, the important mineral constituents. In other words, the analyses are a reliable guide in estimating the probable future crop results.

It is important as well as interesting to notice that the alumina varies very considerably, being highest in No. 1 and least in No. 4. The figures for oxide of iron on the contrary being highest in the poorest soil No. 4, of which in fact it forms just one-fourth or 26·870 per cent. and consequently is unusually ferruginous in character.

There are undoubtedly many Ceylon soils that are equally rich in nitrogen, but the average plantation soil does not contain as much as these Indian soils do. While as regards potash and phosphoric acid, which are most important mineral constituents, there is also a corresponding deficiency, the amount of lime being about the same.

The success which has attended the Indian Government Cinchona Plantations, is generally recognised; therefore it is fair to assume that the analytical results have been fully borne out in the respective yield of valuable alkaloids.

In making therefore any future experiments in Ceylon it would obviously be desirable to proceed with caution and to select a favourable situation in a locality having a rainfall of 90 to 110 inches per annum and a soil rich in nitrogenous organic matter and capable of retaining moisture during periods of occasional drought.

Usually it will be found that richness in nitrogen is also associated with richness in the important mineral constituents, except of course in the case of peaty soils, which though rich in nitrogen and vegetable matter, are sadly deficient in potash, lime and phosphoric acid.

CACAO DISEASE.

The following is an additional report on Cacao Disease by Mr. J. B Carruthers:—

After writing my report in September last, I had brought to my notice the fact that in some cases the bark of the tree behind the diseased pods was cankered, and this led me to carefully examine a number of diseased pods, and I came to the conclusion that there was an undoubted connection between the canker in the bark and the diseased pods. I, therefore, agreed to remain in the island during the recent wet season, *i.e.*, the North-East monsoon, and carry on my observations and experiments; and my doing so, I venture to think, has been of value—first, because I am able to add to, and to a certain extent correct, my former reports; and, second, because I have been able to watch the effects of the different methods of treatment, during the season when the canker is most active.

I propose to describe my investigations into the pod disease and what has been learnt from them and what it teaches us with regard to the treatment of cacao. and then to give the results of observations on the curative means—and how they have succeeded in combating and curing the canker.

In explanation, I must refer to the statements in my previous reports that the disease in the pods was due to an entirely different fungus to that in the bark, and that the pod fungus which belonged to the group of the Peronospeæ could not grow in the bark.

When I first began these investigations in Ceylon, I examined diseased pods and found them to be permeated by quantities of mycelium which was different in character to the mycelium in the bark, and which bore masses of sporangia, *i.e.*, egg-shaped bodies containing the spores or seeds of a fungus totally different in structure from what I afterwards found to be the fruits of the canker fungus. These sporangia, on being applied to healthy pods, induced in them the characteristic disease of the pods. The immense masses of the sporangia prevented me from seeing what I have now found, even in my preparations made when I first began my work, that among them are to be found the much smaller and inconspicuous gonidia spores of the canker fungus. It is only recently that I have been able to see and examine pod disease again; as, during the larger portion of my stay, there has been very little crop on the trees and consequently no diseased pods.

THE INDIA TRADING COMPANY, Limited,

AGENTS FOR MADRAS,

Messrs. HIERON ROLFE & Co., LONDON.

ORDERS BOOKED FOR

BEGG'S PATENT TEA ROLLING MACHINE £95.

PACKING AND SHIPPING £3-10.

THIS machine has been in use for some years past on private estates in Assam, and the excellence of the tea manufactured thereby is proved by the good prices obtained, and the reports characterise the teas as being "good *tippy* teas, with strong pungent liquor, and well-twisted leaf."

The roller adapts itself to any class of leaf, and can be used, if desired, as an open top machine, or pressure can be applied as lightly or heavily as necessity may arise by means of a simple mechanical arrangement. The twist in the leaf is obtained to a degree of nicety without balling, no breakage occurs, and is kept cool throughout. The tips are not blackened by the oxidation of the juice from the leaf.

The low price of the machine will allow planters to obtain an excellent leaf roller at a very moderate figure, and thus be enabled to supplement their rolling plant, which in so many cases is insufficient.

The machine is very easily driven, absorbing about 1½ h.p. only when fully charged. The mechanism is exceedingly simple, and nothing can get out of order. All parts are made of the best material, and good workmanship guaranteed. It will take 300 lbs. of withered leaf at a time, and is easily and rapidly filled and emptied.

TILESTONITE.

A new covering for corrugated iron roofs and walls.

Invaluable as a Heat-, Fire-, and Water-proof covering for Withering-Houses, Fermenting Rooms, Offices, &c.

Makes a clean, fireproof floor for an upper sorting or withering department.

Further Particulars on application to the India Trading Co., Ld., Madras.

In order to prove the action of the canker fungus on the pods, I carried on the following experiments :—

A.—Pieces of cankered bark were placed in selected healthy pods on sound trees. Five pods were so treated. In all cases the pods became diseased after about eight days, and in less than fourteen days spores of both fungi were produced in abundance.

B.—Pieces of diseased pods were placed in the bark of sound trees. Eight of these experiments were made. In all cases canker was produced in the bark, after about ten days, and the spores of the canker fungus, but not of the Peronospora were found after about seventeen days.

C.—Pieces of cankered bark were placed in the bark of sound trees, just above the stalks of healthy pods. Seven of these experiments were made. In all cases the pods became diseased, and on them were produced the spores of both fungi, in about eight days, and on their stalks the spores of the canker fungus only.

D.—Pieces of diseased pods were placed in healthy pods on sound trees, and the disease having been produced, the effect on the adjoining bark was observed. Six of these experiments were made. In three of these experiments, the canker was produced in the bark of the tree adjacent to the stalk, and in the other three cases, the stalk of the pod was cankered, but not the adjacent bark,—in one of them the canker went into the wood of the tree through the stalk, but without affecting the bark surrounding the stalk.

These experiments show conclusively:—1st: That the canker fungus can spread from the bark to the pods. 2nd: That the canker fungus can spread from the pod to the bark, and 3rd: That the disease before described affecting the pods does not grow in the bark, and is confined to the pod tissues, not running into the stalk of the pods.

They also show that the canker fungus grows much more rapidly in the pod than in the bark, and produces its spores much sooner on the former than on the latter. On the bark it takes weeks and often months for the spores to form; on the pods it is a matter of days. The prompt appearance of the Peronospora fungus after the canker has infected the pods, is shown by experiment *C*, but the exact share which these two fungi take in the destruction of the pod tissues should be made the subject of further experiment and observation during the next wet season.

I may here mention that one or two careful observers stated to me, when I was first investigating the origin and nature of the disease, that the canker on their estates first appeared on the trees surrounding the holes where the pod husks were buried, but this I found not to be always the case; and, having no further data to support it, in my knowledge of the life history of the fungi, I imagined it to be a coincidence. This fresh knowledge of the canker fungus points to the fact that the spores from the diseased pods had in these cases infected the trees near which they had been deposited.

That the diseased pods should not be buried in the holes with the healthy ones has been insisted on in the previous reports, and this shows clearly the danger of such a proceeding.

On examining some hundreds of diseased pods, the fungi are in practically every case found associated. The explanation of this seems to be that the Peronospora fungus (which belongs to a group most of which are parasitic, *i.e.*, growing on living tissue, but which also has some members which are suprophytic. *i.e.*, growing on dead tissue) at once succeeds the canker fungus and lives on the tissue killed by it. This I have endeavoured to prove, but have not, up to the present, been able to do, owing to the difficulty in isolating the Peronospora spores so as to get a pure culture of them for the purposes of inoculation; and so I have not been able to observe the action of the Peronospora spores *alone* on a healthy pod. The action of the canker spores alone I have been able to observe on a healthy pod, but, in the space of about two hours, it was joined by the Peronospora fungus and spores of this latter produced.

The characteristic brown patch which is very moist to the touch when cut, caused by the presence of these fungi on the pod, is more frequently found at the ends than on the middle parts of the pods. This is due to two or three causes.

In the first place the central tissue of the pod is frequently the means of conveying the mycelium of the fungus from one end to the other, and this is always the case when the stalk is affected. On cutting open a pod diseased at both ends, or the stalk and point diseased longitudinally, the central tissue bearing the seeds will be seen to be discolored owing to the presence of the mycelium of the fungus. There is also a greater tendency for the spores to germinate at the stalk end or the point than on other parts—at the stalk end there is a naturally-formed cup round the stalk, which retains moisture longer than the sides of the pod, and at the tip a drop is often formed, which remains for a sufficiently long time to enable a spore to germinate and push its germ tube into the tissue of the pod.

In observing the general effect of the pod disease all over an estate, one finds that the diseased pods are gregarious on individual trees, so that on one tree ten or twelve diseased pods are seen, and none on the neighbouring trees; while on a tree at some little distance again there are a number of diseased pods. This is more marked where the trees are grown at a reasonable distance apart. This is mainly due to the rapid spread of the disease from pod to pod, the spores being produced in a few hours, and conveyed to the nearest pods which they, in their turn, affect and produce more spores.

The spreading of the spores over an estate is a most interesting, and the most important, question in relation to the canker, and has received a great deal of thought and attention from me, as it is by means of the spores that all the increase of the disease comes about. Though I have seen cases of infection from pod to stem and *vice versâ*, by actual contact, these cases are so rare that we can neglect them and consider that the spores are responsible for all the extension of the disease.

The methods of infection of different trees are very various; but we can distinctly point to three or four chief means of attack which have been constantly observed. In the first place, the wind has no doubt the largest share in spreading the spores, especially over large distances, and it is the wind which enables the disease to spread from estate to estate. Instances of this may be mentioned. In one case an estate was chiefly and first attacked at the point nearest to a native garden which had been entirely killed out by canker, and the trees allowed to remain after they were dead; a prevalent wind blowing from this direction. Cases similar to this are numerous. On the other hand, the disease is often absent from sheltered hollows, even though there were present all the conditions which favour it, because the winds pass right over, and not through the cacao.

The next and nearly as important an agent is water—both rain and river. Rain washing down the trees and dripping off the pods on to other pods or parts of branches and stems, carries with it the spores from infected places, and leaving them, causes fresh spots. I have seen a tree covered with a mass of small fresh diseased places all independent of each other, below an old patch of canker, which was covered with spores. There have been many and clear proofs of rivers spreading the disease—in some cases, I fear, by the dead timber being thrown into the stream and conveying its deadly cargo to other places lower down: and also a number of instances of cases of flood washing the spores over a flat area of cacao and infecting the trees. A very clear case of this was found in one young clearing, where practically every tree was cankered just above the surface of the ground, where a few inches of water had stood for a short time during a flood.

But, in addition to both wind and water, ants and other small animals are the means of spreading the disease to an extent that I think is hardly recognised. Any one who has watched the ceaseless activity of ants in running over stem, branch, and pods of cacao tree, cannot fail to see how they must be the means of carrying from one place to another the spores when they pass over them. I have examined the legs and bodies of some ants which had been travelling over a tree having spores on its bark, but without discovering these spores on them. But, considering the extremely small size of the spores, this does not materially weaken the contention, and, indeed, I should have been surprised if in any of the few cases I examined I should have discovered any spores. The fact that the ants frequent the pods, where they feed on the secretion from the backs of the white coccidæ that live on the juices of the pod alone, makes it probable that in the case of the pods the ants are responsible for a good deal of damage in carrying infection.

How much part the pods take in spreading the canker in comparison to the stem and branches, it is very hard to determine, but the rapidity with which the fungus grows in the pods, produces its spores, and spreads to other pods and to the bark, leads to the supposition that in many cases the majority of the damage is due to the disease in the pods. It is unfortunate that in most estates

the time when the largest number of pods are on the trees is the wet season, which is most favourable to the fungus, and a suggestion may be offered in this connection:—It is well known to cacao planters that the amount of fruit produced by each tree at the different crop times varies; that one tree produces a bigger spring crop and not so big an autumn one as another—this is an individual characteristic which is in many cases quite pronounced. If such characteristics are carefully selected in propagating (as has been done to produce the early and late varieties of cereals and many other cultivated plants) a plantation may be formed which will, in normal seasons, habitually produce its largest field of fruit in the spring when the dangers of attacks of fungi are much less and when the planter has the advantages of sun in ripening his pods and curing his seeds. By continually using seed which has been produced in the spring, no doubt this would be gradually done; but it would be more effectually and quickly brought about if the planter would observe for a year or two those individual trees which bear their fruit more in the spring, and by using the seed from them, get in time a spring crop variety. The attention of planters might also with reason be drawn to the practice of grafting which Mr. Hart, of Trinidad, has shown to be practicable in cacao, and which would, without doubt, lead to most interesting results.

With regard to the curative experiments, the interest of my stay over the wet season has been to me very great, for I have been able to visit some ten estates in different districts, in all of which curative treatment has been carried on, and in all cases the treatment has been to a great extent successful. It must be remembered that in the previous reports, the treatment by shaving was not recommended as the best but as a second method, when trees were so badly diseased that the more drastic method of entirely cutting out the diseased tissue was likely to kill the tree. The conditions necessary for the success of the shaving are a dry atmosphere, or still better direct sunlight. In estates where, because of shade, the atmosphere is seldom dry, except during a long drought, the shaving treatment does not succeed so well. By "shade" is not meant merely the shade produced by other trees put in for that purpose, but the shade produced by the cacao trees themselves. If the trees are so close that the branches overlap each other, then the ground is shaded just as if heavy shade trees were present. Where the canker is prevalent, the danger of such proximity in spreading and favouring the disease is very marked, and in more than one case where the air has been let in by judicious pruning as well as by cutting down shade trees, the good effects have been most marked.

But in all cases where the effects of the shaving have not been marred and even nullified by excessive shade, the trees, as a rule, were cured. I have examined more than 300 trees, the diseased parts of which had been carefully shaved as recommended, and in only 36 of these was there any sign of the disease. In the case of some estates which had been visited by a most unusually prolonged dry period, the trees had, in nearly every case, been cured, but in these places a proportion of the trees which were badly diseased, and require to be shaved over a large surface, had succumbed to the effects of the drought and the shaving combined; but, in these cases it cannot be said how long the trees would have survived had they been left; and it is probable that the disease would have itself killed them in a not very much longer time, while, by shaving off the diseased bark and destroying it, a vast amount of danger to the remaining trees was removed.

However, the rule laid down in the last report still holds good; in my opinion, where possible, the whole of the diseased tissue and a wide margin should be entirely excised and destroyed, but in the cases of badly diseased trees the shaving may be tried; and it must always be remembered that having shaved them they are not yet safe, and must be, after a short period, examined to see if the treatment has been satisfactory; and if any active canker still remains, it must be cut out.

The experience which we have gained during the wet season shows us that it is possible, even in cases of estates seriously diseased, to combat the disease; but, it also shows very clearly how much more easily the disease is kept in hand when it is looked after in its initial stages; and it is, therefore, of great importance that all growers of cacao who have no canker, should be the victims of a wholesome dread of the disease, and by constant watchfulness discover the first signs of any canker, and destroy all affected parts, whether occurring in stem, branch or pod.

The statement in the second report that Forastero was much less attacked by the canker than the Criollo, there is reason to think should be to a certain extent modified—though all the data still point to the Forastero being less attacked; yet the existence of fairly large areas of Frastero badly affected show that given the conditions necessary, the disease can. in both bark and pod, produce great, and if not checked, fatal damage to an estate which is entirely Forastero.

The cutting out or shaving of trees is an operation that calls for great care, but a very little instruction enables the cooly to understand and practise it. I have seen it carried out perfectly by large bands of coolies on several estates. However, planters will find that a great deal of supervision is necessary to avoid scamped work, which is in many ways more dangerous than not doing the work at all, as it induces a false feeling of security. The application of lime and other washes, while beneficial as a preventive, makes the detection of the cankered parts more difficult, in fact, the disease goes on growing under the applications until it is noticed by the bleeding, and this means that it must have been active in the tree for some time.

The necessity for a continual inspection of cacao trees is rendered more imperative by the fact that in a considerable proportion of the cases of canker examined, the mycelium of the fungus has penetrated to the wood and runs along the wood and breaks out at another place in the bark; but if the parts of affected bark are all removed in most cases this mycelium in the wood is starved out. Still, this habit of running under the bark in the wood is insidious and calls for special observation even when a tree appears to have been properly treated. Special coolies who show themselves clever at their work, constantly examining the trees of an estate, will be certain to repay a hundred-fold their daily wage.

In conclusion, it appears from a further period of observation, that if the methods before laid down for battling with the disease are carefully carried out, this enemy to cacao cultivation may be gradually exterminated, and it behoves all cultivators, however small the area of their plantation, to do their best to fight the disease and to see that they are not the means of spreading the spores of the fungus to the detriment of their neighbours', and the destruction of their own, trees.

MARKET REPORT.

COFFEE.

The *London Commercial Record* of 16th ult. says:—The demand has been slow, as is usual with the near approach of the Xmas holidays, and the market closes with a decidedly flat tone for all kinds, except a few colory lots of new crop Costa Rica, which sold with good competition at full prices Ceylon Plantation realised steady rates. A parcel of Peruvian of good quality sold at firm prices. A generally better feeling has prevailed for "futures," and although at the close there is a little less demand, quotations all round show an improvement for the week, *viz.*:—

London	Santos	March delivery	...	31s 9d.

Auctions this week have passed off as under :—

CEYLON.—*Plantation.*—2 casks 3 tierces 7 barrels 1 bag sold, middling 103s, good middling 108s, bold 110s.

JAVA.—37 bags bought in : also 108 bags *Jilore*.

MOCHA.—131 packages withdrawn.

JAMAICA.—20 barrels 46 bags half sold, good ordinary pale 32s; London-cleaned, smalls 34s 6d to 35s 6d, peaberry 51s 6d.

COSTA RICA.—508 bags half sold : new crop smalls 43s, low middling dull greenish 58s ; London-cleaned, smalls 28s to 37s 6d, medium colory 71s to 76s, bold 90s to 92s, peaberry 81s 6d to 87s

COLOMBIAN.—3,037 bags catalogued, and 1,900 bags sold :—small to good ordinary pale Antioquia 29s to 35s, fine ordinary 40s, good ordinary pale Cucuta 34s to 35s, ordinary to good ordinary pale 30s to 38s 6d, fine to fine fine ordinary greenish and gray 40s to 50s, 6d, low middling gray 53s to 57s 6d, peaberry 60s 6d ; London-cleaned, smalls 22s 6d to 40s, dull soft greenish mixed red 46s to 51s, low middling soft greenish 55s to 59s, middling 60s to 65s 6d, good middling 66s 6d to 71s, good colory and bold 72s to 81s, peaberry 55s to 80s.

PERUVIAN.—234 bags London-cleaned sold, smalls 34s to 35s, fine ordinary 42s, mixed dull greenish 45s 6d, middling 57s 6d, good middling colory 67s, peaberry 55s to 65s.

VENEZUELAN.—113 bags withdrawn.

CLOSING REPORT.—Auctions to-day comprised 946 bags Nyassaland, 28 half-bales Mocha, 141 packages Jamaica, 15 bags Peruvian, 270 bags New Granada, 94 bags Coban, 1,190 bags Vera Paz, 56 bags Costa Rica, 974 bags Guatemala, 638 bags Columbian, 162 bags Mexican, 68 bags Porto Rico, 289 bags Ecuador, 17 bags Guayaquil, and 173 bags Salvador. The sales went off at full prices for good and fine qualities, but inferior lots were neglected.

Messrs. Wm. Jas. & Hy. Thompson's Report of the Colonial Markets for the week ending December 7th, 1898, states :—

This market continues in the same quiet state reported during the past few weeks, and although the supplies have been smaller, prices show no improvement.

According to Messrs G. Duuring & Zoon, the stocks at the European ports on the 1st inst. shewed an increase of 13,000 tons, and the total visible supply a decrease of 8,680 tons, being estimated respectively at 222,450 tons and 410,290 tons, against 209,450 tons and 418,970 tons on the 1st November.

Daily receipts averaged 5,400 bags in Rio, and 14,200 bags in Santos.

Futures have been dull and lower, closing prices shewing a decline of 6d per cwt., viz. :—Good average Santos in Havre, March delivery, fcs. 38.25, in Hamburg pf. 31¾, and No. 7 low ordinary Rio in New York $5.65

TEA.

The *Record* of 16th ult. says—CHINA—A small trade is passing quietly with practically no change in prices. During the week 5,938 packages have been offered at public auction but only a small proportion sold.

INDIAN.—Public auctions were smaller amounting to 34,800 packages, against 46,400 packages in the preceding week, and 49,700 packages at this period of 1897.

The above reduction in supplies somewhat steadied the market, and there was a better demand generaly at the comparatively low rates now current. Pekoe Souchongs and Pekoes with fair cup ruled firmly, while strong liquoring Pekoe Fannings up to 8d per lb., and Broken Pekoes of a similar character, from that figure to 11d per lb. received more attention, and were often dearer. Fine and finest Orange Pekoes and Broken Orange Pekoes, particularly when possessing a touch of cold weather flavour met with spirited competition, and fetched on the whole higher prices.

For 30,800 packages on estate account 8⅜d per lb. was obtained, contrasted with 8¼d per lb. for 39,800 packages, and 32,200 packages in the last two seasons.

CEYLON.—Sales were rather heavier, embracing 19,700 packages, opposed to 14,000 packages on the 6th inst., and 21,500 packages a year ago.

Useful leafy kinds were in request and sold without much alteration though occasionally, when quality was not so good, they went against sellers. Broken Pekoes drawing coloury infusions were wanted and evinced a hardening tendency, whilst many of the upper lines also recovered a little in value.

The average is 8⅛d per lb. On the 8th inst. it was 8¼d per lb., and 8⅛d per lb. at this time in 1897.

JAVA.—Only 233 packages of direct import were offered, of which 173 were from the Djati Nangor Estate, commanded brisk bidding and brought 9d per lb. No further catalogues have at present been issued.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns were :—

From 1st to 13th Dec., 1898..... 8,521,883 lbs.
,, ,, 1897..... 7,764,992 ,,

During the week the following have been printed for sale by public auction :—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	30,833	3,998	34,831
Ceylon	18,767	944	19,711
Java	233	—	233
Total	49,833	3,942	54,775

Also 793 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report dated December 16th, 1898, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	913,353 pkgs.	643,101 pkgs.	25,269 pkgs.
1897-1898.	901,785 ,,	668,263 ,,	25,023 ,,

35,064 pkgs. Indian
20,718 ,, Ceylon
233 ,, Java
} Total 56,015 packages were offered in public auction this week.

Movements of Tea in the United Kingdom for the first six months of the present season, as shown by the Custom House figures, are given below. A considerable increase has taken place in the duty payments upon Indian Tea, but in comparing the total duty payments with the previous year it must not be forgotten that an exceptional payment on about 3 million lbs. of Tea was made at the end of September 1897 ; these figures therefore do not show the increase which is actually taking place in the Home Consumption. Re-exports of Indian and Ceylon Tea are encouraging.

INDIAN. The sale was comparatively small, only 35,064 packages being brought forward against 46,769 packages last week. The inclination was to a rather steadier market with a slightly improved demand, rates current last week being well maintained throughout the auctions. Invoices now arriving are beginning to show some autumnal flavour.

Week's average of Tea sold on Garden Account 1898, 30, 797 pkgs., av. 8·25d. 1897, 40,496 pkgs., av. 8·51d.

Total Tea sold on Garden Account 1st June to date 1898, 664,250 pkgs., av. 8·46d. 1897, 657,796 pkgs., av. 8·96d.

Ceylon. 20,718 packages were brought forward against 15,693 packages last week. The Teas met with a good demand and were mostly sold without change in quotations, Teas for price continuing in strong demand. Average for the week 7·99d., against 8·27d. same period 1897.

Java. The small Auction included 173 pks. of fine flavoured Tea from Djattie Nangor which with good competition realised an average of 9d. per lb.

HIGH CLASS TAILORING.

We have now secured the services of Mr. W. J. Marden, whose experience as a cutter and Practical Tailor extends to a period of over 20 years in some of the leading houses in England and India, and whom we can, therefore, confidently recommend as a veteran expert cutter. Having placed our Tailoring Department under his control, we guarantee perfect Fit and Style. This assurance, coupled with our proverbially Cheap rates, will, we trust, induce you to give us a trial order, which we respectfully solicit.

FREE CHRISTMAS GIFTS.

We are giving away 4 Bicycles and 200 useful Prizes. Numbered Ticket is given for the purchase of every 2 Rs. worth of goods. Drawers of the lucky numbers will receive the prizes free.

COCOA.

The *London Commercial Record* reports:—Auctions were held on Tuesday last but were little better than a farce. 1,634 bags catalogued, of which 280 bags African sold at 67s to 68s for good and 66s to 66s 6d for good fair, being some decline. Private transactions have been somewhat extensive during the week, including 236 bags ordinary Native Ceylon ex the auctions at 68s, also 200 bags Trinidad at 74s to 76s for good red, 1,200 bags Grenada at 68s to 72s for fair to good, 100 bags Dominica at 65s, 500 bags Bahia at 67s, 800 bags African at 65s to 68s, and 700 bags Guayaquil—grey Caraquez at 71s to 72s, Balao at 72s, and good Arriba at 80s to 84s per cwt.

PEPPER.

Black.—The market assumed a firmer appearance early in the week, and values advanced somewhat, but at the close the tone is dull. On the spot sales of fair Singapore have been made at 4¾d, dusty Penang at 3¾d, and good Alleppy at 4½d. For arrival about 200 tons Singapore have changed hands, viz., January-March shipment (s.) at 4⅞d to 5d (closing at 4⅞½d), and February-April at 5d. The small shipments (received late last night) will no doubt lead to a firmer market.

At auction on Wednesday only odd lots were offered and sold "without reserve" as follows:—4 bags fair Singapore at 4½d, 10 bags brownish and grey Alleppy, and 20 bags brownish but stalky Tellicherry at same price, and 15 bags Penang light dusty at 3¾d per lb.

CLOSING REPORT.—*Pepper.*—Black quiet. 300 bags Singapore sold at 4¾d for fair. February-April shipment quoted at 5d.

GINGER.

Cochin.—There is no change in the position, prices remaining firm but demand quiet. Catalogues embraced 179 cases 375 bags 40 bales, of which 59 cases 200 bags 40 bales sold—bold and medium cut and scraped 83s, medium ditto 58s 6d to 59s 6d, dull small roughly cut and scraped 35s, ditto mouldy 31s to 31s 6d, good bright clean small washed rough 23s to 23s 6d, fair washed 22s, medium brown Calicut rough rather wormy 21s dull cuttings wormy 13s per cwt.

Green.—4 barrels St. Vincent sold at 26s per cwt.

CINCHONA BARK.

The Monthly Auctions on the 13th ult. offered 1,953 bales, which met a very good demand and, with the exception of a few piles which were rather highly limited, the whole sold at full prices to here and there some advance, although we cannot quote the unit higher than 1d.

381 bales 10 cases *South American* offered and all sold—stout split Red quill 1s 11d, cultivated Calisaya Yellow quill 4½d to 7d per lb.

135 bales *Ceylon Cinchona* sold as follows:—Succirubra chips and shavings 2½d to 2⅝d, ditto renewed 2¾d to 3⅜d per lb.

853 bales *East India Cinchona* catalogued and 640 bales sold—Officinalis chips and shavings 2¼d to 4½d, ditto renewed 3d to 6⅜d, quill 4d per lb.

Of 352 bags *Java Cinchona* offered 220 bags sold—Ledgeriana, chips 2¾d to 4d, branch 2½d to 3⅞d; Hybrid, root 5d to 5½d per lb.

218 bales *African Cinchona.*—Succirubra quill 4⅛d to 4½d per lb.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 20th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Please note the change of address.

Coorg. Polli Betta, 10*th January*.—*Weather*.—Clear and windy the last few days. Previously cloudy, dull and humid; and it has been difficult to get coffee dry. *Crops*.—Coming in with a swing, proving better than was expected. *Plant Diseases*.—Condition of coffee very good, considering the heavy crops on the trees. Ought to give good average crops again next season. Reaping of Paddy in progress. *General Health*.—very fair.

Kotagiri. Nilgiris, 12*th January*, 1899.—In. 65.58 were recorded here last year, the average due being only In. 58.92. Better distributed, this good rainfall would have been beneficial and been appreciated, but it was either drought or deluge throughout the year, and coffee suffered from both; the rain in February was too early and too heavy, whilst the three months, June, July and August, influenced by the S. W. monsoon made a very poor show with the miserable record of In. 9.16 aggregate fall for these three months, estates out to the eastward hardly getting half that, when much mischief during that dry period was done; on the other hand the N. E. monsoon has been very heavy, consequently crops hung fire and a very appreciable quantity of crop has been dropping; but after all most estates are picking in excess of estimates and some are bearing very heavily. The outturn generally runs light: as a rule, into 3 figures or close on to it.

ATTRACTING CUSTOM.

Attracting custom. The grocer realises that this is an important part of his work. He must do it, or his business cannot expand, if indeed it can be held together. There is a "retail" sound about the words. Yet do they not apply equally to the wholesale dealer? And is it not the duty of even the producer to attract custom? Unless he can do so,

his products will not realise the value that he would like to obtain nor sell so freely as he would wish them to sell. As to the aim in view, therefore, he may learn something from the retailer. Perhaps he may acquire some useful information as to methods from the same source. Only recently, we read that in a large house in the United Kingdom an enterprising firm delivered at the houses of respectable residents price-lists, business cards, and—*free samples of tea.* Each sample was but an ounce or so, in a neat little paper bag; but it was a sample, and the price (in this case 1*s.* 6*d.* per lb.) was stated, and customers were requested to "please taste." This is but one among many methods of "attracting custom." It is advertisement in one of its most practical forms, and consequently in one of the most efficacious. Of course, such a distribution of samples would need to be made with discretion: it stands to reason that the quality of the bulk represented by the sample should be adapted to the probable requirements of the class of people to whom the samples are sent. Probably, too, advertisement and even personal canvassing would be found very useful supplements to a distribution of samples. What we now wish to point out, is the soundness of this method of application of the principle of "baiting the hook." If tea be given away like this in small samples, surely it is an improvement on the old style of "given away with a pound of tea," and other catchpenny methods of trade competition.

There is, however, need to consider also other methods of attracting custom. In the first place, samples could be of no use unless they were samples of articles likely to please the taste of the recipients. Take for example, an *American* town. Of what use to send round numerous samples of Indian teas until the palate of the people has been educated to an appreciation of these teas, or the teas themselves adapted to the taste of American consumers? There is something more than a mere prejudice to be overcome, if we are to be guided by Mr. WILLIAM MACKENZIE'S reports and letters. That gentleman has told lately a story he heard from a representative of the well known firm of tea dealers in America. Mr. LARKIN'S traveller called on a grocer several times, who had rather a prominent store, but who refused to take in any of Larkin's packets, because there was no demand for pure black tea. A Welsh family settled near this grocer's place, and the lady made her grocery purchases there. She complained bitterly to the grocer of the quality of his tea. He gave her different kinds, but could not satisfy her. Wishing to retain her custom, he got a package of "Salada" which he sent her. She called next day and thanked him, saying that was what she wanted. The grocer said: "There is no use my keeping that tea, as you will be my only customer." She said "no, there are several old-country families near me, I'll ask them to tea and make customers for you." Within a week, she had sent him several customers. This surprised him so much, that he took a packet home and had his wife make it. He tried to swallow it, but felt he was getting sick, and spat it out. But his customers returned for it, and he resolved to give it another trial. This time he forced himself to swallow it; he tried it again, and now he and his wife drink it regularly! But first, it made him feel sick! And again at Philadelphia Mr. MACKENZIE was told that the very girls who were pushing the sale of Ceylon tea could not be got to drink it! The "people from the old country" ask for it. Those from the new have to be fairly "educated" before they can take it. Obviously, under circumstances such as these, distribution of samples of ordinary Ceylon and Indian teas would be mostly waste. If Indian planters are to command the American market they must either manufacture teas to suit the American palate or "convert" the American consumer to a taste for such teas as are manufactured in India. The course of these two that is likely to prove the easier, is the one that should be taken; and until a definite choice of route has been taken expenditure in advertising, &c., should be cautious rather than lavish. True, even now Ceylon and Indian teas may be largely used in America for blending purposes; but we think the goal sought by tea-planters here should be a monopoly, not a mere secondary position to that occupied by growers in China and Japan.

It is in the matter of blending that we find the chief obstacle to a direct distribution of samples by the planter. If it were possible for the planter to attack the strongholds of individual households, to convince the consumer that Indian teas are preferable to Chinese, and thus to stimulate demand, much would be achieved. But *pure* Indian tea is only *acquiring* popularity, it has not yet entirely ousted blends, and it is not always retailed in England on its merits. Hence, we can scarcely suggest that Indian planters would gain an immediate profit if they threw out sprats in the form of samples such as those we have referred to. At the same time a distribution of such samples might do a great deal of good. It is the consumer that must ultimately be reached. Doubtless it pays to distribute samples and "cups" of tea at exhibitions and elsewhere. We can even believe that a prudent distribution of free chests or half-chests among selected grocers would not be money thrown away. It is open to question, however, whether in the long run Indian tea-planters might not find it more to their advantage to arrange for a wide distribution of free samples among *consumers.* Co-operation for some purpose of this kind might be tried on a comparatively inexpensive scale. We cannot suggest the same for coffee, unless the aid of a reliable firm of roasters could be enlisted, so that samples of the roasted (or even the roasted and ground) Indian berry might be spread far and wide over the country. Perhaps this suggestion deserves consideration. At any rate, it would probably not be very difficult to ascertain, through the medium of District Planting Associations, to what extent tea and coffee planters would contribute, *in kind*, with a view to the organization of a system of distribution of free samples of the pure Indian products. A money contribution to meet expenses of packing, distribution, &c., would be necessary also, but the amount that would fall to each individual would be extremely small.

THE DEPRESSION IN COFFEE.

The outlook for coffee just now is not very cheering according to the utterances of various writers. Still, the fact remains that Indian varieties have hardened a trifle of late and that even Brazilians are not as low as they were a few

NOTHING EQUAL TO THESE IN THE CARNATIC.
[2-10-98—t f.o]

months ago. The American quotations we give every issue have shown, on the whole, some improvement. Their fluctuations prove how largely Brazilian coffee is operated on by speculators. This fact no doubt explains suspicions such as have lately been expressed by Messrs. W. H. Crossman and Brother, of New York, that the decrease recently shown in receipts in Rio was due to the holding back of coffee, owing to the unsatisfactory state of exchange. This firm considers that "official reports at Rio must never be taken seriously." Planters are feeling the effects of the rise in exchange, which during the last six months has amounted to something like 40 per cent. Still, well managed estates in Brazil are said to be profitable even now. Messrs. Crossman consider that the growing crop is likely to be a record-breaker, so we must conclude that the steadying of prices of late has been entirely due to the adverse tendency of exchange. As regards other countries, Messrs. Crossman remark that the falling off in the Java crop, compared with last year, has already shown itself in the decreased arrivals from July to date. Information about the other crops continues as unreliable as ever. Reports from Mexico so far agree in foreshadowing an enormous yield there. From Venezuela, Central America, and the West Indies the probability is the next crops will be up to the average. The Bahia crop has only just commenced to be sent down, the coffee doubtless having been kept back there, the same as in Rio. But withal, the total of all crops other than Rio and Santos does not change much, and is likely to be up to the usual average. They observe that if there is a shrinkage in one quarter, it is usually compensated by a larger yield in another. New localities are constantly being added to the coffee-producing countries, such as in Hawaii, South Africa, and the west coast of South America, and although a great deal is heard of unprofitable coffee cultivation at existing values, persistence in the production indicates that it is more remunerative under equal conditions than sugar and other tropical products.

It is a gloomy report; and, let us hope, a pessimistic one. Still, notwithstanding fears of over-production, every wise planter will agree with the Sao Paolo *Brazilian Bulletin* in holding that it is a grave mistake on the part of the Brazilian coffee merchant to attempt to minimize the output of coffee for the purpose of putting up the price. The enormous producing capacity cannot be concealed. Climate, soil, immunity from disease, and abundant labor conspire to make Brazil the great coffee-producing country of the world. The better policy would be to stimulate production and promote consumption. That is a sound principle, all the world over.

MANURING EXPERIMENTS IN BENGAL.

ALTHOUGH the manuring experiments conducted from time to time on the experimental farms in Bengal do not deal with Tea or Coffee, it should be of interest to planters to watch progress. The study of manuring must be to a large extent in the abstract. The application of what is learnt will of necessity involve fresh experiment. Even if the manuring of tea is studied in one place, the application of the lesson in others will often be merely experimental, for soils differ as widely as products. Hence it is that we review the Report of the Director of Land Records and Agriculture, Bengal, for 1897-98 with a special interest in the manuring experiments carried on in the Bengal Farms. These are three in number, and are at Sibpur, near Calcutta, under charge of the Government; at Burdwan, the property of the Maharajah of Burdwan; and at Dumraon, belonging to the Maharajah of Dumraon. As regards the Sibpur Farm, Dr. Leather reported that owing to the variable nature of its soil it was unsuited to the purposes of an experimental farm, as reliable comparisons could not be made between the results obtained from different plots. Perhaps this accounts for the fact that while manure experiments were made with oats, potatoes and cabbages, decisive results were obtained with cabbages only. With this crop it was found that the highest outturn was obtained by the use of saltpetre; but the difference in the effect of this manure and castor cake, with which it was contrasted, was not so marked as in the previous year.

On the Burdwan Farm the effects of different manures were tried on paddy, sugar-cane, jute and potatoes. With paddy, a mixture of bonemeal and saltpetre (at the rate of 3 maunds of bonemeal and 30 seers of saltpetre per acre) yielded the best results, and bonemeal alone came next in efficiency. This confirms experiments made the previous year. Cowdung also proved very useful and gave a high net profit. In fact, the conclusion arrived at is that, so far as the practical value of the manures is concerned, there seems to be little to choose between cowdung and a mixture of bonemeal and saltpetre. Experiments were also made to test the relative merits of manuring paddy with cowdung and with jute ploughed in. There was no marked difference noticeable in the results of the contrasted plots, though both these plots gave about double the outturn obtained from the unmanured plots. The experiments made in manuring the local *shamsara* variety of sugarcane showed that bonemeal and cowdung produced the largest yield of *gur* (jaggery). The previous year, however, this mixture gave the poorest yield, a mixture of cowdung and "supers" having ranked first. Cowdung came second. It is remarked, however, that the experiment must be continued for several years before any conclusion can be drawn. Cowdung proved the most useful aid to jute. As a good manure for potatoes there seems to be little to choose between castor-cake and cowdung. The manured plots gave over four times the outturn off the unmanured one. It may be added that pitted cowdung was again found superior to cowdung purchased from the raiyat.

In Dumraon, ashes of cowdung gave the best results with paddy, cowdung ranked second, bonemeal third. The first two manures raised the crop two-fold, the outturn of grain per acre obtained by their application amounting to 2,132 lbs. and 2,010 lbs. respectively, against 1,002 lbs., the outturn obtained without the use of any manure. The cost of the manures was more than recouped by the increase in outturn. Bonemeal proved less useful and more expensive and yielded an outturn of 1,670 lbs. The average yield of paddy obtained by neighbouring cultivators in the same season was estimated at only 820 lbs. per acre. With wheat cowdung again proved the best, when tried against ashes of cowdung and saltpetre, bonemeal, town-sweepings and green manures, all of which were applied in such quantities as to supply 50 lbs. of nitrogen per acre. The outturn of grain on cowdung manured plots was 1,805 lbs. per acre, and the average of the unmanured plots amounted to only 485 lbs. per acre. The net profit from the plots manured with cowdung, after deduction of all cost of cultivation, manuring and harvesting, amounted to Rs.32 per acre, while the

unmanured plots showed a loss of Rs.6 per acre. Town sweepings gave fairly good results, running to about 1,625 lbs. of wheat per acre. It is observed, however, that the results of a second experiment with wheat tended to show that cowdung manure does not take much effect on wheat unless the land to which it is applied is irrigated.

COFFEE IN DISTANT LANDS.
II.

British Central Africa.—The export of Coffee for the year ending 31st March, 1898, was 860,664 lbs. (say 7,685 cwt.), showing an increase of 98,282 lbs. (say 878 cwt.) Referring to complaints of "Empty berry," Mr. W. T. Thiselton Dyer, of Kew Gardens, lately wrote to the Acting Commissioner as follows :—

"I am sorry to state that on this side it is impossible to carry on an exhaustive investigation into so obscure and intricate a subject as this evidently is.

"The matter can only be satisfactorily studied on the spot and with a full knowledge of all the local circumstances.

"Judging by analogous conditions in other plants we suggest the 'empty berry' was probably due to want of nutrition in the plants, or the concurrence of severe drought during the growth of the berry. The former might be remedied by forking the soil and the application of farm yard (not artificial) manure. The latter might be met by irrigation; but should this be impossible, the ground around the trees after forking and manuring might be covered or 'mulched' with cut or other vegetable *débris* to keep the soil cool and moist

"These are simple and practical suggestions that cannot fail to be permanently beneficial to the coffee trees So far there is no evidence that they have been carefully tried."

The Gold Coast.—The Curator of the Botanical Station, Aburi, reports as follows :—

Coffea Stenophylla.—A parcel of seed of this coffee, known as Sierra Leone Coffee, was received from the Curator at Sierra Leone in January, 1897. It was sown and germinated freely—we now have a good stock of young plants both in pots and beds ready for planting out to permanent places in the next rains.

Coffea Arabica.—Arabian Coffee does not thrive at Aburi, the soil and the climate seems totally unsuited for it. There are only about 200 plants in the Botanical Station, and these are dying out very rapidly. Only five bags of this coffee were shipped during the year, and I purpose planting Liberian Coffee in the place of the Arabian and doing away with the latter, with the exception of a few plants.

Coffea Liberica.—Liberian Coffee, this species gives every satisfaction : there are 3,400 planted out, 2,300 of which are bearing fruit. This makes a lot of labour during the harvest, namely, picking, pulping, fermenting, washing and drying, all of which is done by the same amount of labour and expenditure as when there was no fruiting coffee in this station. The first shipment of coffee was made in 1896 after my arrival at Aburi.

In gathering the coffee we find the large red tiger ant to be a great nuisance : they bite so fearfully as to make the men afraid to pick from infested trees. I have tried solutions of kerosine and water, also lime, but without the desired effect. I should be glad if any correspondent could suggest a means of eradicating this pest.

Plantations.—In the Akwapim District there are hundreds of small coffee and cocoa plantations which have originated from the Botanical Station, especially the Liberian coffee and cocoa. The facilities given the Curator for travelling are practically *nil*, but of the few plantations that I have visited, the best that I have inspected are those belonging to the Rev. A. W. Clerk and the Rev. Samson, both retired Basel Mission Ministers. The former is a Jamaican, and has been in the Colony nearly 54 years. Mr. Samson is a native. Each of the above-mentioned plantations contain about 1,000 Liberian Coffee trees and the same number of cocoa ; these two gentlemen take a great interest in the cultivation of Coffee and Cocoa, and that cured by them finds a ready sale in Accra, owing to its being properly cleaned and dried. The natives of the interior, I believe, only take their cocoa from the pods and dry it in the sun, without either fermenting or washing. This, of course, does not command such a good price as that which is properly cleaned. Many natives from considerable distances have visited the Botanical Station for the purpose of obtaining information. After being instructed how to cure their coffee and cocoa they have gone away delighted, and very grateful for the information they have received. Some have been given small samples of coffee and cocoa to compare with their own, and I trust that nothing but good results will be the outcome of the above-mentioned object lesson.

Paraguay.—It seems that the first attempts at cultivating coffee in Paraguay are meeting with complete success. Among the many varieties the most cultivated there is one which comes from Bolivia, whose geographical position is pretty much the same and whose soil is also very similar. It is believed that this coffee can compete with the best known in the markets of Europe, where it already figures, though in small quantities. It is a little early yet, however, to talk of an export trade with Europe. At present, it is said, a market can be found in Paraguay for all the coffee produced, and it will probably be some years before the Paraguay article will command recognition in London or Paris.

Among the recent reports from United States Consuls is one from Mr. Ruffin, at Asuncion, with reference to the adaptability of the soil of Paraguay for the production of coffee. He says there are coffee plantations which have been in existence for many years, but they have not been cultivated, being left to some extent to the excellent climate. These plants produce a variety similar to that cultivated in Brazil and Bolivia, coming from the Arabian species. The production in this line is not extensive, and the consumption is local. The plantations which have been established of late years have proved profitable investments, as a market has been found in Paraguay for all the coffee produced. According to the statistics obtainable, Mr. Ruffin places the number of coffee plants in the Republic at 343,407. He thinks all the products can be disposed of in the Asuncion market, as "the people are great coffee drinkers."

The coffee plant thrives best in countries having a mean temperature of from 68 to 78 degrees Fahrenheit. The official findings give Paraguay a temperature of from 58.42 degrees in June to 84.45 degrees in December, or a mean of 71.16 degrees. The land is suitable for cultivation, as it is level and damp and can be worked easily. Among the many varieties of coffee, Mr. Ruffin says that the most cultivated in Paraguay is the *yungas*, because it originated in Bolivia, a country with much the same geographical position and a very similar soil. It is believed that this coffee can compete with the best known in the markets of Europe, where it already figures, though in small quantities. Authorities state that the *yungas* coffee of Peru and Guatemala is as good as any produced on the American Continent. The grain is well

developed, of exquisite aroma, green-yellow in color, and in size and weight superior to Mocha coffee, which in general characteristics it resembles. The plant is vigorous, develops rapidly, and produces in three years.

PRIZE ESSAYS.

Only two essays have yet reached us, so even if the "good" and "better" stages have been accomplished there is no "best." One or two planters who have not yet found time to compete have expressed their desire to do so, and we therefore extend the time allowed to the *14th February* 1899. For the convenience of new subscribers, we repeat our statement of rules concerning our first prize essay competition, the subject of which is

THE LABOUR QUESTION.

THE PAST, PRESENT AND FUTURE SUPPLY OF LABOUR IN THE . . . . . DISTRICT.

FOR the best essay on this subject from any planting district in Southern India, we offer a prize of **Rupees one hundred.**

RULES.

1. Write on one side of the paper only.
2. Sign your name in full, and state address (not for publication, except in the case of the winner).
3. Be as brief and concise as possible.
4. Cite your authorities where possible.
5. Mark your M.S., "Prize Essay Competition."
6. Submit not later than 14th *February*, 1899 (in Madras).

IT should be clearly noted that all essays sent in will be the absolute property of *Planting Opinion*, and that the proprietors will have the right to publish them, in full or abridged or revised, in *Planting Opinion* or elsewhere, and to republish in pamphlet or book form. No limit of length is fixed, but conciseness will count when "points" are reckoned up. Rupees one hundred will be remitted to the winner immediately after publication of the prize essay.

NOTES.

Indian Tea Shipments to the U. K. in 1899. The estimate of shipments of Indian Tea to the United Kingdom in 1899 is 1½ million lbs. in excess of the shipments of 1898.

The Penny Post. The Ceylon Association in London has accorded "to J. Henniker Heaton, Esq., M.P., a hearty vote of thanks for his strenuous and successful efforts in the cause of Imperial Penny Postage."

The Bombay Tea Company. *The Grocer's Journal* was officially informed that the shares of this Company were applied for several times over.

Sale of a Ceylon Estate. It is reported that Kandahena Estate, at Namunukuda, has been sold to a Kalutara planter for Rs.60,000. Kandahena consists of 363 acres, of which 132 are in tea, and 68 in coffee.

Ceylon and the Coolgardie Exhibition. Up to the 31st ult. about 43 estates in Ceylon had contributed exhibits of commercial teas for the Coolgardie exhibition. The smallest contribution was 20 lb., the largest 80 lb., the total about 2,520 lbs.

"Rocks Ahead." The *I. P. G.* warns tea planters that gardens thrown up as unprofitable may fall into Native hands, and of the ultimate result that must inevitably follow. To this risk might be added that of abandoned gardens developing into very nice nurseries for pests and blights.

The Calcutta Tea sale. The first Tea sale of the year in Calcutta was held on the 6th instant, when about 18,000 packages were sold. There was a strong demand for Pekoe Souchong kinds, which were quoted fully three pies dearer. Other grades were steady at previous rates. Good teas sold well.

A new Ceylon Tea Enterprise. The Ceylon Planters' Direct Supply Association has been started, with offices in London, with the object of encouraging the taste for good tea which has of late so greatly degenerated. All residents in Ceylon are invited to become agents, and thus benefit themselves and the Ceylon tea enterprise.

Grafting Coffee. The Java *Locomotief* mentions successful experiments in grafting Java coffee on Liberian coffee trees. These trials have been carried on in East Java, where ordinary coffee, it is said, has very poor prospects indeed. Opinion is divided as to whether the success achieved can be looked upon as permanent.

Coffee in Jamaica. A correspondent at Clarendon, Jamaica, writes :—We have no gold mines in Jamaica, except our coffee trees, oranges and other staple products. Sugar estates are being crippled. Years gone by 100 lbs. of coffee could pay five taxpayers' taxes of 10s. each, and something left for family's support; but now it can hardly pay taxes.

The British Duty on Tea. At a meeting of the Committee of the Indian Tea Association, (London) on 13th ult., the following copy of resolution passed in Ceylon was read :—"That the Committee is not yet sufficiently convinced of the desirability of reduction in the tea duty in England to induce the Committee to take up an agitation on the matter at the present time."

Coffee in Porto Rico. Porto Rico is the most highly cultivated of the West Indies, and produces sufficient food for its inhabitants in addition to large crops of sugar and coffee for exportation. It has 361 large coffee estates, 4,184 small coffee farms, 433 sugar estates, and 16,988 small fruit farms. Coffee grows in the high lands and sugar on the lower slopes and plains.

New Markets. Thus the *I. P. G.* :—"That it would not be out of place to call upon the

Indian Tea Association to take a little more interest in the matter of finding new markets for Indian teas, we are convinced ; but no reforms have ever been brought about without united and concerted action. If Indian planters are not as much alive to their own interests as their Ceylon *confréres*, they have only themselves to blame." Hear, hear !

Acme Tea Chests. In succession to the old metal chests the Acme people have now brought out a new box, made of an outer lining of Canadian wood in *four* thicknesses of veneer in contrast to the "Venesta's" three. The metal binding of the lid too is bent, not cut, which is an improvement, and the whole is fastened with a sort of hasp coming over and clipped by two ends of the metal which meet in the centre just beneath the hasp.

Coffee on the Sirumallays. A correspondent of the *Madras Times* visited these Hills during the Christmas holidays, and now writes that from what he was able to see crops were affected by both leaf disease and bug. Owing to continuous rains, the labour supply had been very irregular, so much so that the coffee berries could not be picked, and many had dropped to the ground from over ripeness and disease.

Tea Prospects. A London correspondent writes :—I hear it stated on good authority that there will be a considerable deficiency next season from at least one tea district in India for which the estimate was originally much larger. In fact, the stocks at home are now on a much more satisfactory basis than they have been for some time, and better prices for both Ceylon and Indian teas are confidently expected if only the supply keeps within reasonable limits of moderation.

Scale Pests. The dangers attending the importations of Australian fruit have lately been commented on in Ceylon, and the interest that has been aroused in the study of scale and other pests may yet have a revolutionary effect on the fruit export trade of various countries. Indeed, in some quarters caution has developed into timidity, and we could even cite an instance where it has been decided not to import Indian *coffee seed* because of the fear that some pest might avail itself of the opportunity to seek pastures new !

The Australian Tariff. Commercial advices from Australia state that the all-absorbing topic of the moment is the increase in the tariff on such commodities as tea, dried fruits, canned fruits, rice, cocoa, coffee, &c. The change has been made without the previous knowledge of importers, and for the moment the markets have been excited. The additional duties will severely curtail business in a number of British commodities, such as jams, preserves, cocoa, chocolate, and the like. The increase has been made solely for revenue purposes.

The London Tea Market. Telegraphing to Colombo on the 5th inst. Messrs. Gow, Wilson and Stanton reported that the market was generally steady. Fair liquoring Ceylon Pekoe Souchong was quoted 6½*d*., and the average for the week 8*d*. (both unchanged). Reuter reported the same day a "generally firm" market, fair Pekoe Souchong 5¾*d*. (¼*d* up) and the average 8*d*. Of 20,000 packages Ceylon Tea offered 18,000 were sold, and of 32,000 Indian 29,000 changed hands. The average of Indian was 8⅝*d*., a rise of ⅛*d*.

"Ceylon in India." Writing from the Coimbatore district about the end of the year, Mr. E. J. Martin, formerly of the Kelani Valley, reports, according to the *Ceylon Observer* :—"We have some magnificent soil and a fine climate and I am much pleased with the land and climate up here, after the Kelani Valley. I have several Sinhalese here who are felling and are quite happy and contented. Being a new district we have many difficulties to contend with, one especially being transport ; but, a cart road is being pushed on as fast as possible and the Engineer's only difficulty is that he can't spend the money fast enough."

Java Teas. The *Ceylon Observer*, after remarking that Java Teas are coming to the front, and must be allowed for in estimates of the future, as cultivation is extending, says :—"Of course, there should be a wide market for such teas in Holland, Belgium and Western and Northern Germany, if only the Java planters, their agents and friends properly cultivated it." If Ceylon and Indian planters do not keep very wide awake, they will find that Java teas will spread far beyond the area named above, and try to deal by Indian and Ceylon teas as these have dealt by Chinese.

Colombo Tea Sales. On the 5th instant, about 10,390 pkgs. = 800,645 lbs. were offered, of which about 8,173 pkgs. = 636,551 lbs. were sold. The *Times of Ceylon* says :—"At the opening sale of the year a very firm tone prevailed for nearly all grades, especially common leaf kinds, which were in strong demand. Medium grades were not so keenly sought after, while fine and finest qualities were rather easier. Among the finest teas in the sale were : Devonford, Monkswood, Middleton, Glasgow, and Ottery. Amongst low-grown teas, good invoices were offered from Glencorse, Chesterford, Putupaula, Eila, and Rayigam."

Tea Estimates. The Secretary of the Indian Tea Association (London) lately issued a circular stating that "In view of the importance to the tea industry of accuracy in the published figures showing the acreage under tea cultivation, it is desirable that a circular be addressed to the Secretary of the Indian Tea Association, Calcutta, and to the Members of the Association, as also to other associations in India, representing tea interests, suggesting that their members be asked to supply Government, when required, with the necessary information to enable correct returns to be drawn up."

Starving the London Markets. Reviewing the year 1898, the *Times of Ceylon* remarks :—"The advantage of starving the London Tea Market has come home to the planting community with increased force, and we venture to think that the United Kingdom will never receive for home consumption—unless there is a considerable rise in prices—a larger total from Ceylon than that sent forward in 1897." It is a bold forecast, and probably India will be the gainer should it prove to be also a true one. Our contemporary adds, with respect to 1899, that regarding the *cultivation* of tea, much help is expected from Mr. Kelway Bamber's investigations.

"The Imperialist." We are in receipt of a copy of the first issue of *The Imperialist*, published at Calcutta, and aiming at representing a "United Anglo India" and at providing a high class Journal of a distinctly political character, in defence of the interests of the European community of India and their descendants, and for the advancement of their welfare politically, socially, and intellectually. It will voice the grievances of this community and advocate its claims in the State services, and in all that concerns its material welfare." The programme is comprehensive, and the new paper may prove a very useful one.

A Hospital Ward for Indigent Planters. Mr. J. Buckingham, C.I.E., the Chairman, Assam Branch Indian Tea Association, has announced that a sum of nearly Rs.5,0 0 has been collected by private subscriptions towards the above object. He adds :—"It will be remembered that at our last Annual Meeting I proposed that the balance required should be obtained by asking managers to give a small annual subscription of, say, Rs.10 for each assistant on their estate. The Assam Company through their Superintendent, Mr. Hulbert, and a few other estates have promised to subscribe up to the amount I proposed. If the proposal meets with the response I anticipate, the sum required will not exceed Rs.5 per annum per assistant."

Misleading Figures. The *Times of Ceylon* has discovered that published figures regarding exports of Ceylon Teas are not all in accord. It now writes :—"During the past year the total shipments of tea from Colombo—we learn from the Secretary of the Chamber of Commerce—amounted to the unexpectedly large total of 119,972,071 lbs., of which 96,126,145 lbs. went to the United Kingdom. The total to the United Kingdom for December last was 8,500,000 lbs., and the estimate for the current month is 8,500,000 to 8,750,000 lbs. The export to all countries for last month was about 750,000 lbs. larger than our estimate a fortnight ago." It is explained that the Customs authorities do not include a shipment until the entries are passed, while the Chamber of Commerce include it 'at once' (whatever this may mean.)

"Cheesy" Teas. The dangers of blending are illustrated in a remark by the *Grocer* on the subject of 'cheesy teas': "Dealers and the large blenders have found it to cause much inconvenience when, in making a blend, a tea supposed to be sound, but that is in fact cheesy, has been mixed with other teas, and the whole blend has consequently become tainted, thus detracting from its original value." Our contemporary adds :—It is no uncommon thing for a buyer to ask at the auctions, "Is this Tea sound ?" and as the reply is that the parcel is sold as per sample, which is sound, buyers have to take it as such ; whereas part of the break may be cheesy, the parcel not having been properly inspected. Buying-over brokers are naturally careful that their clients get what they purchase according to sample, and do not care for part or whole of a break bought to be unsound, which means that the whole parcel will be "chucked up," as it is generally expressed, thereby causing inharmonious proceedings to all concerned. The question is now being privately discussed by the Tea Brokers' Association, and it is to be hoped that this vexed question will be settled on a proper basis, thus removing friction in the trade which would not otherwise occur.

The American Tea Trade. Paper warfare between Mr. E. A. Willard, a champion of Chinese and Japanese Teas, and Mr. Blechynden, the Indian representative, has been waging in the States. So far, it does not appear to have been fought out. Mr. Willard asserts that the liquor of China and Japan infusions is clear, of Indian muddy, and he has a gentle poke at fertilizers. Mr. Blechynden replies that nightsoil is the great fertilizer in China and Japan, and is absolutely unused in India and Ceylon, where the tea gardens flourish on practically virgin soil. He points out that the active principle of tea is caffeine, and India and Ceylon tea contain sometimes as much as 4 per cent. of this alkaloid, whereas China tea contains less than one per cent. and Japan tea barely a trace, and that black teas contain less tannin than green trees. Finally, he says :—"I maintain that all the green tea from China and Japan is artificially colored, and that not one single ounce of India or Ceylon tea is artificially colored. It is therefore ridiculous to say that any tea can be purer than those from India and Ceylon. In round figures some 87¾ million pounds of Japan and China tea came into North America last season. Will any champion of these teas say what proportion of these teas was free from artificial coloring ?"

Coffee in Central Africa. Visiting the Chiole Mission Station, a branch of the Zambesi Industrial Mission, Mr. S. Israel found that the coffee planted there seemed to be carefully attended to, but badly in want of rain. The nurseries and vegetable gardens by the way of irrigation, presented a fine appearance and proved the fertility of the soil. He remarks that scarcity of labour should never be spoken of considering the large Hinterland from which an unlimited supply can be drawn. The Angoni are only too willing to work for planters, they are not frightened of internal troubles, thanks to the interference of the Government, but they do not seem to know their proper position toward the Government yet. *Apropos* of this a report of the Portuguese visit to Nyasaland states that in Nyasa there was at first a great scarcity of labour ; one, of course, could not depend on the white element, and the missionaries did not in the least afford help to the newly arrived planters. Afterwards the natives began to flock in, the hut tax obliged them to earn money and the natural tendency to clothe themselves also prevailed. As a rule they all contracted for 6 months, the men earning from 3 to 5 shillings a month, and the women from 2 to 3. Native artificers earn up to 10/- 15/- per mensem, but there are few of the latter. The coffee prospects at Zomba are said to be unusually good at this season. The coming crop is expected to be more than double that of any previous year.

Brazilian Coffee. The United States Consul General at Rio de Janeiro reports that English and some Belgian syndicates have bought recently large coffee plantations in the States of Minas, Geraes, and San Paulo. At the end of October several British merchants, with engineers and agricultural experts, were expected to visit Rio and Santos, proceeding afterwards into the interior of Brazil for the purpose of picking up bargains in agricultural properties. Mr. Seeger states that, according to the opinions of the best-informed men, profitable investments may now be made in Brazilian landed estates by capitalists who are not obliged to rely on an immediate return. To some extent the circumstances which have occasioned the increased attention now

being directed to Brazil have arisen out of the great depression in the price of coffee, due to the enormous production. During the ten years before 1897 the high level of (paper) prices maintained in the Brazilian coffee markets gave the planters extraordinarily large profits. The consequence was a vast extension in the area of the plantations. The millions of trees then put down have begun to bear within the last two years. The supply of coffee has thus become suddenly enlarged, with the result that the profits of coffee-growing, which in special cases reached as much as 150 per cent. per annum, are now reduced almost to the vanishing point. Hence the great fall in the value of estates and the strong desire to dispose of them.

In Philadelphia.

The stock of Teas at Acker's well-known grocery in Philadelphia includes Formosa and Foochow Oolongs, Young Hysons, pan-fired Japans, basket-fired Japans, Imperials, English Breakfast, Assam and Orange Pekoe, but a specialty is made of Acker's finest Ceylon-India blossoms. This tea, it is claimed, differs from China or Japan teas in the following essential respects: *First.*—It is rolled and manufactured entirely by machinery, especially designed to eliminate all contact with the human hand, thereby insuring superior cleanliness. *Second.*—No coloring matter of any kind is used on Acker's finest Ceylon-India blossoms. *Third.*—No artificial flavor or foreign leaves are permitted in this tea, its strict purity being absolutely guaranteed. *Fourth.*—A given quantity of Acker's finest Ceylon-India blossoms will give twice the quantity of liquid tea which would be given by tea from any other country. Two tender leaves and a bud are all that are used; these contain the concentrated essence and vigor of the whole plant. This accounts for its remarkable strength. Customers are cordially invited to visit the Ceylon India booth and test the tea made by the attendant. Customers are served with samples in the tea booth or at any demonstration counter without charge. The firm circulates tickets and invites customers, through *Acker's Weekly* and the daily papers, to visit their store and to test the quality of their goods, believing it an imposition to ask people to try their goods and then charge them for it. If customers want more than a sample of tea or coffee, it is served at the soda fountain, and the regular price charged. Six or seven demonstrations are always in operation.

Orthezia Insignis.

The *Times of Ceylon* states that Tea planters in Ceylon are confronted with a new bogey in the guise of *Orthezia indignis (sic)*. This is not quite a correct statement. The *Orthezia insignis* Dougl. is mentioned by Dr. Watt as apparently introduced to Ceylon on ornamented plants. It occurs on lantana, and Mr. Green has stated that it spreads to the neighbouring tea, where it has been found crowding into the young shoots. He also said that the infested area in Ceylon had been fired, and the pest apparently exterminated; but from what is now reported the insect is apparently rising again from the ashes of these fires. Still, after what Dr. Watt has stated, and with Mr. Green near at hand to give information, it is curious that our Colombo contemporary should have written as above and should also have said:—"At present it is reported to have specially attacked lantana, for which it deserves our thanks, and, so far, has done little damage to tea. So we may hope that no more will be heard of the pest, as it generally confines itself to one species of plant. There is no record of this insect in Sir Emerson Tennant's exhaustive book, and the natural history collections of the British Museum do not contain a specimen." The *orthezia insignis* derives its title from a Frenchman named Dorthes, who seems to have discovered and classified it towards the close of the last century. It traces its descent from the family of *Coccidæ*, but belongs to the homopterous, as opposed to the hemipterous, branch; that is to say, its wings are of uniform texture, unlike those of its half-brother, better known but known for worse, the bug, whose wings are partly hard partly soft. It is a small scale insect, covered with a white waxy secretion, and varies in length from one-eighth to a quarter of an inch. It is appallingly prolific. The male has wings, but the female is apterous.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50	lbs. Nitrogen.
57·38	„ Potash.
14·92	„ Lime.
13·68	„ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

LETTERS TO THE EDITOR.

A CORRECTION.

DEAR SIR,—In your last issue, you commented on the scheme lately suggested by Mr. Large and elaborated by Mr. Lechler, our local Chairman, for promoting the sale of coffee direct to the consumer, as if it had emanated from me, whereas I had nothing to do with it. Please correct this in your next issue.

Yours faithfully,

YERCAUD, *11th Jan.* 1899. ROBT. GOMPERTZ, *Hony. Secy., S. P. A.*

[NOTE.—We greatly regret that an error should have occurred.—ED. *P.O.*]

MALE COFFEE TREE.

DEAR SIR,—There was, I believe, some correspondence in your paper some time ago *re* "Male coffee trees." I have, what I have always understood and believed to be, a Male tree on this estate. A very fine chick about 37-38 years old. It bears very little crop, and that is all peaberry. I enclose a few beans in parchment, picked yesterday and also a small branch. It would be interesting to learn how many estates have not got a tree of this description, as I cannot help thinking—although I shall probably be laughed at for the idea—that these trees may be beneficial in fertilizing the blossom of coffee trees on an estate. I believe there are certain trees that will not bear in the absence of a Male tree, viz., the Papoy. It will be rather interesting to see what kind of a plant the seed from this tree will produce, and I don't see why it should not germinate as the germ is present in the bean. I will try and see.

Yours faithfully,

7th January, 1899. G. R. OLIVER.

LOCUST DISEASE FUNGUS.

The following letter which was addressed to Dr. Edington, Director of the Bacteriological Institute, Grahamstown, is another testimony to the efficiency of his locust disease fungus:—

SIR,—I beg to state for your information that, immediately after the receipt of the fungus you were kind enough to send me on the 13th ultimo, I began experimenting upon *three* large swarms of locusts (voetgangers) in various periods of development and obtained very satisfactory results. After having dissolved the contents of five tubes of fungus in five ounces of tepid water (which water had been boiled and allowed to cool) I immersed a number of healthy voetgangers in the prepared liquid and gave each of them a dose of it internally, using a quill scoop for the purpose. The locusts operated upon were then placed in a glass covered basket, and fed on young green barley, and the following day a number were placed among the locusts at the head of the three swarms alluded to, which owing to damp and overcast weather were not moving at the time. On the fourth day after, numbers of locusts died, and on the seventh day after the introduction of those infected the three swarms were destroyed. I am of opinion that locusts used for destroying others should be highly infected, as the living devour the dead and in their turn become the means of disseminating disease. (Sd.) J. C. SEYMOUR KINGSLEY.—*Central African Times.*

RUBBER PLANTING IN COSTA RICA.

Curiously, it was the last sentence in the following brief extract that first attracted our attention:—

A recent visitor to New York was Mr. J. H. Conkling, engaged in general merchandise at Arenal, on the San Carlos river, in Costa Rica. Mr. Conkling, reports a growing interest in Costa Rica in the planting of rubber, especially since the Government has offered a bonus of 25 centavos per tree planted. Meanwhile the native trees (*castilloa elastica*) have been disappearing rapidly, in spite of the law intended for their preservation. The trouble, according to Mr. Conkling, has been due to the repeated extension of the time for putting the law into effect. Once a year it is announced that the cutting of rubber on other than private lands will be permitted for twelve months more, and during this time the rubber gatherers, thinking that it is their last chance at the trees, cut and bled them recklessly, and with fatal effects. Mr. Conkling is unable to say what is the cost of making a rubber plantation, but an important fact is that very little expense is necessary to keep one in proper condition, after planting, until the trees are old enough to yield rubber. Another encouraging fact is the low cost of lands. It is unnecessary to remove all the timber in order to plant rubber, but only the undergrowth; the rubber trees soon reach such a height as to take the sun readily, while the return of the undergrowth protects the soil from the sun and keeps it moist—a condition most favorable for the rubber. Rubber tree seeds are readily obtainable, and young rubber seedlings may often be gathered in the forests. While coffee is to-day the principal product exported from Costa Rica, Mr. Conkling thinks that rubber will become the most profitable crop to plant in that country.—*India Rubber World*, Dec. 1.

AN ENERGETIC TEA-PLANTERS' ASSOCIATION.

THE Dooars Planters' Association has passed a whole string of resolutions of a more or less vigorous character. After considering the question of reducing coolie Hazaree to the Cachar Sylpet and Assam rates of wages, viz. Rs.5 for men, Rs.4 women, and Rs.1/8 children, it decided to introduce from the 1st July 1899 throughout the Dooars a uniform rate of Rs.6 for men, Rs.4/8 women and Rs.2 children.

It further resolved, *inter alia*, "That Government be approached through the Dooars Committee of the Indian Tea Association and asked to open negotiations with foreign countries, and arrange matters, so that it will be worth our while to ship to those markets, and thereby to facilitate the disposal of overproduction that at present exists and also to abolish Income Tax, placing tea planters under the agriculturist clause." Vague enough in the earlier part, but precise towards the end. It was resolved also:—That Government be approached through the Dooars Planters' Association to include in British Territory the first range of Bhutan Hills bordering on the Tursa-Sunkos Sub-District owing to the water famine that now exists, and also owing to the lower hills being at present inhabited by outlawed *budmashes* who have taken large advances from the different gardens and whose one idea is to harass and plunder the adjoining gardens; that the Dooars Planters' Association be asked to approach Government to reduce all upward and downward freights on all the railways connected with the Dooars to enable us to meet the present crisis; and finally that all gardens holding aloof from the Dooars Planters' Association be considered as opposed to the Tea Industry in the Dooars, and that they will be liable to certain stringent rules drawn up by the Dooars Planters' Association to deal with their short sighted policy.

"A DISTRIBUTOR" OF COFFEE, &c.

The London correspondent of the *Times' of Ceylon* gives the following, under the head of

AN ENTERPRISING CEYLON MAN AT HOME.

Eleven years of steady persistent effort and good attention to duties as distributor, have not been without their effect on the business of F. J. Horsfall of "The Kiosk," Bournemouth. The business is progressing. Lately coffee roasting has been added to the facilities for the business. The latest circular says: "Every pound of coffee I sell is roasted on the day it is sent out, and each pound is roasted in a separate cylinder, by which means every berry is perfectly developed: it is then cooled instantaneously by a powerful blast of cold air drawn through an electric fan, and all the flavour and aroma retained in the berry. For hotels, clubs, cafés, I make special deliveries twice daily of coffee direct from the cylinders." All this is carried on at 35, Old Christchurch Road, where is fitted most complete and perfect machinery for roasting, cooling, blending and grinding coffee. This plant is driven and worked entirely by electric motors of the most modern type. The premises at Old Christchurch Road are new and additional to those of St. Peter's Chambers, where the business obtained the good name it has amongst all residents in, and visitors to, Bournemouth, by the most excellent quality of tea, coffee, and cocoa sold in the cup. It was the care given to this branch which led to the developments I have above described. The sale of the poorer cheap descriptions of tea coffee. and cocoa, Mr. Horsfall leaves to others. He goes for quality and flavour, the safest of all foundations on which to build a business, particularly in a place like Bournemouth, where there are so many invalids. Harsh, coarse, pungent teas are quite the worst they can drink, chiccory liberally dosed into bad coffee can do them nothing but harm, and as to the much-advertised cocoas with Kola and other such ingredients, the owners who make delicate people believe they are building up their constitutions with such rubbish ought to be prosecuted It is by confidence in his goods that Mr. Horsfall has secured his clientéle, and there is nothing but progress of a substantial character before him. Moreover, he holds the sole agency for Bournemouth of Messrs. Teetjen & Co., Limited.

PLANTING IN CEYLON.

"AN Experienced Planter" has supplied the *Ceylon Observer* with the following "Planting Report for 1898":—

Tea.—The past season has not been a favourable one. The 1897 average price has hardly been maintained either in Mincing Lane or locally—though planters had generally made better tea or tea from less coarse leaf. Exchange has been a trifle more against us than in 1897, and the crops, with some happy exceptions, have turned out less than were estimated. Moreover the tea farmer has had to contend with a new disadvantage, viz., a surplus labour force, through manuring and extensive operations having been greatly curtailed. The industry has also had a much drier season than usual, the rainfall being in several districts less, more especially in sunny Uva. Even fairly wet districts, such as Maskeliya, have recorded shorter rainfalls.

So much for the seamy side. The rift in the clouds may be represented by the cheering fact that less tea has been exported from

Ceylon direct to the United Kingdom, which, however, has continued to export more heavily to Russia and Germany. Ceylon has increased by millions its direct export of tea to Australia and Russia. The Planters' Association's *revised* estimate of exports has been a very exact one.

Unless we have an exceptionally favourable season, the total exports for 1899 will not much exceed that of 1898, for unprofitable fields will be abandoned and it is not likely that coarser plucking will again be resorted to

The tea farmer in Ceylon therefore may take courage and hope soon for better prices. He has touched bottom, while India—but it is as well to confine our review to Ceylon industries.

Coffee.—Its health, as one of our industries, has to be toasted in solemn silence. The cultivation is now as dead as Julius Cæsar.

Cacao planters hold their heads up again, thanks to the assurances of our energetic and shrewd Cryptogamist, Mr. Carruthers, who has, we all hope, only departed for a short season. The Ceylon Government is evidently turning over a new leaf in the matter of the employment of scientists and specialists, and His Excellency will place a feather in his cap if his Government can induce Mr. Carruthers to reside permanently in Ceylon, for if all accounts are true cacao is not the only industry that has to contend with fungoid diseases. Small extensions are being made and we notice that the natives are clearing up their gardens which two years ago they seemed inclined to abandon.

Guayaquil worries us by throwing so much cocoa on the market; but we are assured by large American manufacturers who have lately visited the island, that the consumption of cocoa is increasing, and that the finer varieties of cocoa will always find a good market in the States.

Cinchona.—The good returns Java planters are now enjoying rather make our planters' mouths water; but the soil and climate of Java are more adapted for its cultivation than the Ceylon soil and climate.

Cardamoms.—Those who have so far the monopoly of this cultivation in Ceylon are not blessing the local extensionists nor those of India In a year or two we shall be back to the rupee per lb. and as the days of Company-mongering are over, our monopolists will have to take the bitter or the plain bread of the future with the sweet and glorious cake of the past three or four years.

Minor Products such as ramie, pepper, vanilla, &c., are receiving attention; but I fear these will never do more than add a few rupees to concerns that would live without them.

HOW TO FERTILIZE VEGETABLES.

MR. GERALD M'CARTHY, N. C. Expt. Sta, reports:—

The chief ingredient in a good fertilizer for vegetables of which the leaves or stems are the edible portion is nitrogen. For root vegetables, phosphoric acid and potash are about as important as nitrogen. For vegetables of which the seed is the edible portion, especially such as are planted early, like the garden pea, phosphoric acid is the leading element. For vegetables like the tomato, egg plant, celery, melon, etc., potash is the most important. The following table shows the amount of the different elements of plant food in 1,000 lbs. of the edible portion of the vegetables named:—

Vegetable.	Nitrogen.	Potash.	Phos. acid.
	lbs.	lbs.	lbs.
Beans	...32.9	15.5	9.5
Beets	... 3.4	4.4	0.9
Cabbage...	... 3.8	4.3	1.1
Cucumber	... 1.6	2.4	1.2
Pea	...35.8	10.1	8.4
Rhubarb	... 1.3	3.6	0.2
Spinach	... 2.9	2.7	1.6
Squash	... 1.1	8.9	1.6
Sweet corn	... 4.6	2.2	0.7
Tomato	.. 1.6	0.5	2.2
Turnip	... 1.8	3.9	1.0

Except only as to peas and beans, it will be seen that vegetables are not very exhaustive to the soil. Peas and beans are able to take most of their nitrogen from the atmosphere. The table shows that potash is the element mostly drawn from the soil, next nitrogen, and lastly phosphoric acid. But nitrogen has a value for early garden vegetables that chemical analysis does not show. Nitrogen forces early growth and gives large succulent leaves and stems. Potash gives solidity and crispness to stems and leaves and high colour to the fruit. Phosphoric acid gives plumpness and increases the sugar and starchy parts of seeds, and forces early maturity. A good general fertilizer for all garden vegetables, except beans and peas, would be the following mixture per acre, but intensive market gardeners use two are three times as much:—

Sulphate of potash	...150 to 225 lbs.
Super phosphate	...250 to 375 lbs.
Nitrate of soda	...150 to 225 lbs.

The fertilizer should be raked in just before the seed is sown. For peas and beans, the normal amount of potash and phosphoric acid may be doubled and the nitrate of soda reduced to 50 lbs. per acre.

The sulphate is the best available form of potash for garden vegetables, as it contains no chlorides or salt and does not make the soil cold. It also acts with especial favourableness upon the starchy portion of vegetables. Fresh or water-slaked lime is always beneficial to garden soil.

PRODUCE AND PLANTING.

Two Sides to the Question.—The following letter from Colombo, and signed "Shareholder," appears in the *Pall Mall Gazette*:—"I note that you have published some letters regarding reports issued lately by several Ceylon Tea Companies. I agree with your view that the promised over-supply will undoubtedly bring prices down on the London market, but strongly recommend shareholders agitating to have their estates' teas offered on the Colombo market, where now, owing to advantages of direct shipment, Russian and other buyers are able to pay better prices for the teas than can be obtained on the London market. If the teas are sold in Colombo, the Company saves freight, marine insurance, dock charges, interest, &c.—say ¾d. to 1d. per lb. equal on low-priced teas, say, to 10 per cent. to 20 per cent. The managers of estates and brokers in London are, of course, in no hurry to give this information to shareholders, as they do not want to lose their pickings on the business." This drew the following reply from a correspondent who signed himself "The Proof of the Pudding":—"I have read the letter of 'A Shareholder' in your edition of to-day, and as a proprietor of Ceylon estates sending home an annual production of nearly half a million pounds of tea, I am prepared to say that my experience has proved beyond doubt that it pays better to ship to this country and sell in Mincing Lane than to realise in Colombo. I was very strongly advised by my Colombo agents and others at one time to sell my teas in the island, and I decided to give the question a fair trial, shipping one-half of the crop and selling the other half in Colombo, with the result greatly in favour of the home market. There is no doubt that now and again a better price may be obtained in Colombo, owing to a rush of purchasing orders for the Australian market; but take the average for the year, and it will be found that after allowing for freight, insurance, dock charges, &c., the balance will usually be well in favour of Mincing Lane, which undoubtedly is the tea market of the world."

The Russian Market.—The Russian Empire take some ninety million pounds of Chinese tea annually, a large proportion of it being imported at very cheap rates in returning vessels of the Volunteer Fleet that take out troops, convicts, munitions of war, and railway material to the Far East Indian and Ceylon growers, in their desire to push their produce in Russia, have a great deal of prejudice to overcome, but with the two millions of pounds of British tea now sent thither they have made a fair beginning. If it were not for the heavy duty of 1s. 9d. per lb which, of course, is all in favour of China, Indian and Ceylon teas would mak rapid headway.

Too Generous.—The Admiralty cannot be said to encourage the consumption of tea and cocoa in the Navy. The total abstinence men, and others who do not care to take their allowance of grog, have hitherto been allowed to draw its equivalent in tea, coffee, cocoa, and sugar. And if they cared to economise, even on these articles, they were permitted to carry them ashore duty free, for the use of their families. They may do so still, but under a new Admiralty order, only on condition that they pay the duty on the tea and cocoa.—*Home and Colonial Mail.*

CANADIAN DUTY ON TEA.

The *Toronto Mail and Empire* lately published an article very strongly in favour of British-grown teas. Its remarks were of a highly imperialistic flavour, and we quote them below:—

FREE BRITISH-GROWN TEA.

A duty on tea will probably be included in the next batch of tariff changes. Intimations have been given to the public that such an impost is forthcoming. The last of these premonitory symptoms we find in the columns of that well-informed Liberal newspaper the *Montreal Witness*, which, as a consistent advocate of free trade as it is in England, would doubtless welcome a transfer of taxation from some other commodities to tea. But concerning a tea duty—if the Government is unalterably resolved to impose one, there is something to be said in the name of another principle very different from free trade, and that is preferential trade. If, in face of the Government's decision, it is vain to urge that all directly imported tea continue untaxed, then we shall content ourselves with insisting that some of it—namely, British-grown tea—remain untaxed. Whatever the duty may be, the tea of Ceylon and India must be exempt from it. If it is not, the Government will quickly be made to feel the unpopularity of the impost. To remove from the free to the dutiable list, a staple product of two great divisions of the Empire—a product, too, which ranks as one of the necessaries of life—would be to do too great violence to the sentiment in favour of preferential trade. A few months ago a new tax was levied on the people of Canada for the benefit of the sugar producers of the British West Indies, that is, the sugar duties were raised, and a differential rate was established in favour of the islanders. If the Canadian people will thus submit to a tax to help one part of the Empire, it is very certain they will not submit to a tax to injure another part. Instead of contemplating the idea of imposing a duty on British-grown tea, the Government might very well take into consideration the advisability of freeing such tea from the 10 per cent. duty on shipments of it coming here from the United States market. That tax, however, might wisely be retained as against tea of foreign origin, for it is notorious that much of the China and Japan tea coming into the country is unfit for consumption. On the other hand, the general excellence of the tea of Ceylon and India is almost of itself enough to entitle that tea to a preference. It is wholesome, unadulterated tea, prepared for the market by modern machinery methods, instead of by the primitive and less sanitary hand methods which are yet followed in China. Already Canada is a large market for Ceylon and Indian tea, and is rapidly becoming larger. A Canadian duty, therefore, would strike our Cingalese and Indian fellow-subjects of Her Majesty very heavily.

THE ANGLO-AMERICAN DIRECT TRADING COMPANY.

Whether South Indian planters take shares in this Company or not—we fear it is too late for them to secure may at par—the coffee men might make a special note of its aims, as stated in the Prospectus:—

The Company is formed, "for the purpose of combining a distributing and producing tea and coffee business by acquiring and establishing large distributing businesses in the most important centres in the tea-drinking countries of Great Britain, United States, Canada, Russia, Turkey, and Persia," together with estates in India and Ceylon, "thus practically bringing the consumer into direct contact with the producer." Retail grocers will be interested in learning that "it is intended . . . to develop a distributing business on a large scale in the United Kingdom. The Directors have been looking for a favourable opening in the distributive branch of the tea trade, but, knowing the special importance of good personal management in this class of business, they waited until they were able to procure the services of exceptionally capable managers. This they are satisfied they have now done." With a view to successfully establishing a business of the nature described, arrangements have been made and are now in course of completion for the purchase of the following blending and distributing businesses:—The business of Sherman Brothers and Co. of Chicago, General Tea, Coffee, and Produce dealers; that of Mr. Hubert Galt, Chicago. Tea and Coffee dealer; that of Mr. A. R. Robertson, Tea and Coffee dealer; that of Messrs. Steel Hayter and Co. and the Monsoon Tea Co., Toronto, Tea and Coffee dealers. Details are then given of the various businesses just mentioned, and it is shewn that Galt, Robertson, Steel Hayter and the Monsoon Cos. sold for 1897—2,671,391 lbs. tea, one-fourth of the entire consumption of Indian and Ceylon tea in the United State and Canada for that year. With regard to Russia, the Prospectus states that the Company has arranged to purchase 5,533 shares of £10 each (£2 paid) in the business of Rogivue and Co., Limited, of Moscow, St. Petersburg, Odessa, Nijni Novgorod, &c., &c. The remainder of the shares, viz., 1,467, are held by Mr. Rogivue, founder and present manager of the business, and one of his late partners. Rogivue, Limited, have already eight branches and twenty-three agencies in Russia, and recently a branch has been opened in Lausanne, Switzerland Mr. Rogivue has agreed to manage for a period of at least 10 years, and has a large pecuniary interest in the business. In Great Britain, it is also intended, in co-operation with the Consolidated, Amalgamated and Kanan Devan Companies, to develop a distributing business on a large scale. Arrangements have been made to purchase the following estates:—Nahorani, Nahortoli, Hathibari, in Assam; Ialinga and Allenpore, in Cachar; Koliengode, Polyampara, Puli Vassel, Peria Kanal, Val Parai, in Southern India (these five are coffee); Warwick, Mandara Nuwara, Lynsted, Chetnole, Meddekande, Kassagalla, Halwatura, Maddegedera, Halgolle, and Katugastotte, in Ceylon—total 34,192 acres, of which 9,704 acres are tea, 794 acres cocoa and cocoanuts, and 1,405 acres coffee. The price to be paid for the estates is £518,898; for the various businesses and the shares (£2 paid) in Rogivue, Ltd., £47,599. The average probable amount of working capital for the distributing businesses is given as £150,000. Allowing £65,000 as the value of the unplanted land (22,289 acres) the cost of the cultivated area is £38 10s. per acre. The profits accruing to the Company from all sources for 1898 will probably amount to £33,000. The profits for 1899 are estimated at £46,000. £18,000 is required to pay interest on preference shares of the present issue, leaving £28,000 for the ordinaries. The Company is to be worked as a private Company, and later, formed into a public Company. It is expected this will be done with a substantial profit to the shareholders.

BLACK AND WHITE PEPPER.

The *Grocer* says:—The position of these condiments is well deserving of attention, it having vastly improved of late, and proves that at the port of London, at least, the trade in pepper generally is a growing one. The black descriptions especially have largely increased in importance, the landings in the first forty-nine weeks of 1898 having reached 6520 tons, in contrast with 4650 tons in the same period last year; and although the deliveries (for home use and exportation) have greatly augmented—embracing 5010 tons, in lieu of 3950 tons in 1897 to date,—the stock at this port on the 10th inst. was swollen to 7300 tons, or to 1840 tons beyond that of a year ago, when it was only 5460 tons. The movements in white pepper, however, were of a less pretentious character, as while this year's arrivals have expanded to 3035 tons, in place of not more than 2170 tons in 1897, the total clearances for all purposes have been restricted to 3025 tons, against 3100 tons in the previous year; and the quantity remaining on hand presents an excess of 270 tons, being now 2350 tons, in comparison with 2080 tons in December last.

Another encouraging circumstance in connection with extended operations in the article is that, notwithstanding its greater plentifulness—as gauged by the extra supplies landed here,—black pepper has steadily advanced in value for months past, and is now pence per pound dearer than it was at the end of 1897. Further, if we compare existing rates with those ruling at this time in 1896 it will be seen that a still more material rise has been established, due chiefly to reports of a continuous falling off in the shipments from Singapore and Penang during the current season, and also to the belief that the estimates of the coming crops are far below those in the former year. A significant fact besides the above is that prices in the producing countries are higher than in the European markets, and stocks on the Continent are considerably lighter than they were in either 1897 or 1896. Any revival of demand, therefore, whether for home use or exportation, the latter to the United States or elsewhere, would at once benefit holders, and the dealers

and others, who have no supply of consequence in reserve, would have to give even more money than they are paying for pepper at the present moment. Similar remarks may be applied to white pepper, the prospects for which are almost inextricably bound up with those for black sorts; and to show at a glance the statistical positions of each kind at the port of London, we subjoin a statement of the imports, deliveries, and stock (in tons) for each of the last three years ending about the middle of December, together with the quotations (per lb.) at which the latest business was done on the spot, viz :—

	Imports.			Deliveries.			Stocks.		
	1898.	1897.	1896.	1898.	1897.	1896.	1898.	1897.	1896.
Black ..	6,520	4,650	3,660	5,010	3,950	2,555	7,300	5,460	4,530
White ..	3,035	2,170	1,905	3,025	3,100	2,795	2,350	2,080	2,900

Prices.

	Black.		White.	
	Singapore.	Penang.	Singapore.	Penang.
1898	0 4¾ to 0/4⅞	0/4 to 0/4½	0/7¾ to 0/9½	0 7⅞ to 0/7½
1897	0/3⅝ 0 3¾	0 3 0 3¼	0/6¾ 0/7¾	0/5¾ 0/5⅞
1896	0 2⅜ 0/2½	0/2⅛ 0/2¼	0/4 0/5½	0 3¼ 0 3½

As above shown, the advance which has taken place since 1896 is very considerable, and it is a most singular coincidence that the enhancement in the marketable value of pepper has gone hand-in-hand, as it were, with the development of its trade as a staple of commerce.

TESTING SEEDS FOR GERMINATION.

The absolute essentials for accurate tests are suitable temperature, proper supply of moisture, and free ventilation, though darkness is highly desirable. The normal temperature of germination under natural conditions is from 55 deg.—65 deg. F.; and in artificial tests a constant temperature between 60 deg. and 80 deg. F. should be maintained. The heat of an ordinary living-room will, however, generally be found sufficient for home-tests, though a little fire may be advantageously provided if the night temperature appear likely to fall very low. Perhaps the best and most simple apparatus for home testing is prepared by taking two plates, in one of which is placed a folded flannel or other woollen cloth which is very damp without being soaked The seeds are placed regularly between the folds, and the whole is then covered by inverting the other plate over it. Another equally simple apparatus is made by soaking a handful of cotten-wool in a glass or tin dish containing water. The seeds are placed on the cotton-wool preparatory to the dish being covered with a sheet of glass to check evaporation. Seeds not larger than cereals may also be tested by placing them between the folds of damp flannel or blotting-paper in a porous clay saucer—unglazed flower-pot saucers will do—standing in from one-third to half its height of water in a tin pan which must be covered with a sheet of glass. Sufficient moisture will soak through the porous saucer to ensure germination. Several saucers can, of course, be placed in a large pan at one time. Plaster of Paris dishes are better in every way than ordinary porous saucers; and they are very simply made by mixing the plaster with water until it is of about the consistency of cream, and then pouring it into a suitably-shaped box, the hooked or screwed sides of which will readily come apart when desired. Take a sheet of glass as large as the top of the mould, and fix a shallow flat bottomed glass dish to it with cement. Use the pane of glass so prepared as a lid for the mould or box. The affixed dish thus projects into the soft plaster, making the necessary depression. Flannel and blotting-paper may be dispensed with if plaster dishes be employed for tests, the seeds being merely sown on the bottom of the depressed centre. Another method of testing several samples at once is that of obtaining a large dripping pan, and placing an inverted flower-pot saucer in each of the four corners. On these rest a flat wire framework, on which folded pieces of flannel or blotting-paper are placed, each with an end of flap hanging down into the water in the dripping pan. The seeds are put between the folds; and the hanging flaps, by capillary action, keep them supplied with moisture. Of course, it is best to cover the tin with a sheet of glass to minimise evaporation.—*Agricultural Gazette.*

EXPORT DUTIES AND OPEN MINTS.

Having lately quoted "X" (in *Capital*) on the Exchange Problem, we now give Producer's remarks in reply. "Producer" writes:—

The objection which "X." in his article of November 24th, takes to the above policy is probably that which has prevented much discussion of it hitherto. It seems to me, however, that the matter is open to further debate. Everyone will allow that the quotation from Mill's Principles of Political Economy correctly describes the usual course of trade, except, perhaps, that it may be doubted if, in these days of quick communications and worldwide competition, there is such a thing as a customary profit. Most industries are constantly passing through the phases of high, barely profitable, and unprofitable prices. To give this quotation from Mill as a reason why we can expect no permanent profit from allowing exchange to fall to its natural level seems to me carrying the argument too far. For, if the evanescent nature of large profits is a reason why it is useless to try and make them out of low exchange, it is equally a reason for abstaining from trying to make them out of any business whatever. It is equally useless to endeavour to reduce the cost of production and transit, because, as soon as an extra profit is made, others will rush in and take away the profit, on earning which probably much capital has been expended. The acceptance of such a theory would destroy all incentive to trade, and, as a matter of fact, we know that neither merchants, manufacturers, nor agriculturists act on such a theory. On the contrary, they are always trying to reduce the cost of production and transit in order to reap the large profits which await those first in the field in introducing improvements. They recognise the evanescent nature of large profits owing to competition, but that makes them only the more eager to snatch them while they may. The way they show their appreciation of Mill's warning is by constantly opening up new lines of business, lest, as has happened to many firms and companies who stick only to old and well known lines, they may find their business rendered unprofitable through overproduction. In arguing that a sudden fall in exchange would benefit exporters "for a time—that is all," and that the profit would tend to slowly but surely disappear, "X" seems to me to ignore the well known methods by which men of business habitually provide against that inevitable law of trade.

He also seems to overlook the effect of such a fall in exchange on the volume of trade. Probably no one will dispute the following propositions :—

(1) A comparatively high rate of exchange, while her rivals enjoy a lower rate, tends to diminish India's trade.

(2) A low rate of exchange would certainly enable Indian producers to oust some of their rivals from some branches of trade and secure them for India

(3) The extra profit a sudden fall in exchange would give would induce a rush which would mean a large increase in the volume of trade. (I am not, of course, arguing that a sudden fall is preferable to a gradual return to a natural level of exchange, but merely taking the case as "X" puts it, that exchange would probably fall to 10d. in a year.)

(4) The volume of trade is of far more importance to a country than the profits of individuals.

(5) To provide capital for and encourage the opening of new lines of business there must be good profits on existing lines.

If these propositions are accepted, it does not seem difficult to show that the fall of exchange to its natural level would be of permanent benefit to india. For, once a large trade was started, however much the profits of individuals might diminish, the volume of trade would remain at a maximum, as long as those engaged in it could pay their way, or get credit to carry it on. This is especially the case with such industries as mills and plantations, which require the expenditure of a large capital for some years before they earn a profit. As long as the volume of trade remained large, the country would benefit by increased employment and the

Government by increased revenues. For the increase in the volume of trade would counteract a very heavy fall in prices, and prevent Government receiving less support from the export duties. It would probably take a considerable time before the fall in gold values would counterbalance a fall in exchange from 1s. 4d. to 10d. per rupee, and the greater the fall in gold prices the less would India's rivals be able to stand her competition. Meanwhile large profits would be earned, which the more far-seeing would devote to opening up new lines and thus further increasing the volume of trade. These new lines would be safe from overproduction long after the old lines had been rendered unprofitable, or until they again became profitable. It has been argued that the rise in exchange is a blessing in disguise to the tea industry, as by checking profits it has checked overproduction. To give profits to the few who can weather the storm at the expense of the mass of people engaged in any trade does not seem a very enlightened policy. It would be better to encourage large profits on a big trade, however temporary such profits might be, in hopes that some of those who made these profits would invest them in new lines. As a matter of fact, some of the most successful tea companies invested their profits, before 1895, in opening up plantations of cocoanuts, coffee, cocoa, and other products. Once good profits are made, it is easy to launch out into new lines; but, if profits are cut off or reduced to a minimum, there is no capital available for such enterprise.

"X's" supposition, that in the absence of a rush into a profitable business,—that is of overproduction,—the factor of competition would come in, is not in accordance with my experience. For instance, from 1887 to 1896 there was no overproduction of coffee, and sellers certainly did not compete with one another to reduce prices. It was the buyers who competed, and prices remained at the same high level for ten years Another supposition is that producers make a profit on a 1s. 4d. rupee. At the prices of the last ten years we, coffee producers, could do so, but prices have fallen heavily this year, and the chances of making a profit, even with good crops, is becoming finer by degrees and most unbeautifully less. South American countries have enjoyed an exchange ranging from the equivalent of 6d to 1s. per rupee, and have found production so profitable that they have doubled the stock of coffee in the world in two years and reduced the price in a corresponding degree. They could not have done this with anything like the equivalent of a 1s. 4d. rupee. Then as to the question whether tea could stand a duty of 6 per cent. with exchange at 1s. 1d. Tea was so profitable at 1s 1d. that, as Sir John Muir mentioned before the Currency Committee, large sums were invested in the extension of planting. It may be presumed that men who saw their way to a good profit, in spite of a large increase in production, would not be afraid of a 6 per cent. duty. Speaking for coffee planters, I can say that the difference between exchange at 1s. 1d. less 6 per cent. export duty and a 1s. 4d. rupee, that is, between Rs 1,735 and Rs.1,500 for every £100's worth of coffee sold, would be a very welcome help to assist them to tide over the depression of prices caused by Brazil till reaction sets in. Lastly, it is no doubt true that export merchants with a big margin of profit might force a foreign market; but we have evidence before the Currency Committee from some of the largest export merchants that the ryot is so wide awake to his interests, and the competition between the exporting houses is so keen, that the latter have to be content with very small profits. It is enough for my purpose, however, if it is allowed, that the ryot would make sufficient profit on present rates to cover the export duty, as he would not then be sensible of the heavy burden of increased taxation. Supposing there to be a margin of profit of 60 per cent. surely at least 12 per cent. would accrue to the ryot, if he is so wide awake as the big exporters tell us? I may mention that neither Mr. Acworth nor Mr. Gompertz alone originated the policy I advocated. They no doubt helped to do so, but so did several others who take a leading part in the affairs of the United Planters' Association of South India *Quorum pars fui.*

"MONSOON" TEA.

WHERE MONSOON IS GROWN.

The famous Indian tea gardens which apply the tea direct "From the grower to the consumer"—How Monsoon is grown, picked, cured and packed, and how it became a packet tea.

THOSE solid old British houses which exert a controlling influence in different commercial lines in the trade of the world are a notably conservative element. Their enterprises may be of im-

THE INDIA TRADING COMPANY, Limited,

AGENTS FOR **MADRAS,**

Messrs. HIERON ROLFE & Co., LONDON.

ORDERS BOOKED FOR

BEGG'S PATENT TEA ROLLING MACHINE £95.

PACKING AND SHIPPING £3-10.

THIS machine has been in use for some years past on private estates in Assam, and the excellence of the tea manufactured thereby is proved by the good prices obtained, and the reports characterise the teas as being "good *tippy* teas, with strong pungent liquor, and well-twisted leaf."

The roller adapts itself to any class of leaf, and can be used, if desired, as an open top machine, or pressure can be applied as lightly or heavily as necessity may arise by means of a simple mechanical arrangement. The twist in the leaf is obtained to a degree of nicety without balling, no breakage occurs, and is kept cool throughout. The tips are not blackened by the oxidation of the juice from the leaf.

The low price of the machine will allow planters to obtain an excellent leaf roller at a very moderate figure, and thus be enabled to supplement their rolling plant, which in so many cases is insufficient.

The machine is very easily driven, absorbing about 1½ h.p. only when fully charged. The mechanism is exceedingly simple, and nothing can get out of order. All parts are made of the best material, and good workmanship guaranteed. It will take 300 lbs. of withered leaf at a time, and is easily and rapidly filled and emptied.

TILESTONITE.

A new covering for corrugated iron roofs and walls.

Invaluable as a Heat-, Fire-, and Water-proof covering for Withering-Houses, Fermenting Rooms, Offices, &c.

Makes a clean, fireproof floor for an upper sorting or withering department.

Further Particulars on application to the India Trading Co., Ld., Madras.

mense extent, involving investments of millions of dollars and the employment of thousands of people, but no show is ever made in any branch of their business to dazzle the community with anything that could be construed as a vain glorious ambition to shine as a gorgeous or palatial establishment.

The grim old warehouses in London, Liverpool and Ceylon of the old British company, which grows, picks, cures and packs Monsoon Indo-Ceylon Tea, would never delight the eye of the lover of artistic effects. The great counting rooms in London busy with bustling activity, as they are, present very little to enchant the visitor, who has a taste for elaborate decorations or fancy furnishings. Everything is severely plain, antiquely solid, and almost reverentially staid. The Toronto depôt for the sale of Monsoon Indo-Ceylon Tea, comprising the warehouse and offices, which occupy the building at No. 7, Wellington-street west is rather plain and unpretentious in appearance, but it is a bijou of business elegance when compared with the great old parent house in London. No sign of pride is shown in the towering evidence of the immense trade and the great business solidity of the company. Warehouses, counting rooms, ships and depôt in foreign lands are regarded merely as incidents and adjuncts to the real business of the company, which is the growing, curing and packing of an incomparably fine tea. The soul of this company is in its tea gardens in India, where Monsoon Indo-Ceylon Tea is grown—and there is no concealment of the pride which inspires these growers to possess the finest and best managed tea estates, equipped with the best means to yield the best results, and to improve wherever improvement is possible, to produce a product that shall delight and hold the preference of tea lovers all over the world.

Two photographs, selected from a number of views of the tea gardens where Monsoon is grown, were re-drawn with pen and ink by *The World* artist . . . . . Much of the exquisite effect of the two scenes, preserved in the original photographs, is lost in the re-drawing. *The first view shows the pickers, all native women, in spotless white raiment*, passing through the rows of tea bushes in one corner of the great plantations, engaged in packing the Monsoon tea leaves. The contrast of the gracefully draped white figures amidst the glossy deep green foliage in the field of ripening tea, which is brought out with striking beauty and distinctness in the original photographs, is barely hinted at in the . . pen-and-ink sketch. The time of the tea picking, in the picture, is at the dawn of the day -but this fact, and the radiant tones in which nature paints the dawn of the East India morn, with the morning stars sparkling in the blushing eastern skies, are beyond the possibility of being portrayed anywhere but in a painting. *The second picture represents a group of carriers with the white metal vails full of the tea leaves*, picked by the women in the fields Over a thousand natives are employed on these estates in gathering the tea. Expert English labour is employed in the modern processes of "firing" these teas on the estates and after thorough seasoning, the tea is driven by marvellous machinery into the packages in which Monsoon is sold by grocers. This process, and the clever mechanical operation which frees the thoroughly cured tea leaves from every particle of tea dust, and makes Monsoon the cleanest tea in the market, are among the most interesting features in the careful treatment which Monsoon Indo-Ceylon Tea receives before it is sent out to delight its patrons.

The fact that all India or Ceylon-grown teas are wholesome and pure, does not imply that all are choice in flavor, or choice in any of the other nice properties which the true tea connoisseur most appreciates. An India tea, carelessly picked, and carelessly "fired" or cured, is quite sure to prove rank to the taste, and millions of pounds of such teas enter the packets of most brands, mixed with special grades, and often scented, to disguise their rank inferiority. In the tea gardens where Monsoon is grown, the leaves are picked when fully ripe and when fullest of the rich, aromatic sap of the plant. At this stage of its growth, the leaf contains no appreciable trace of tannin, which, in other teas, picked after the leaves are withered and dry on the stalks, has been left as a deposit by the last run of the sap. The picking of Monsoon Tea while the leaf is richest with sap assures the strength in flavor and body for which Monsoon is famous and the perfect process of "firing" the sap-laden leaf preserves the exquisite aroma and spirit which is developed later in the sparkling liveliness which a drawing of Monsoon Indo-Ceylon Tea shows in the cup, and in the delicious and refreshing "twang" which it leaves in the mouth. Monsoon Tea is so much richer in strength than other teas, owing to the careful and intelligent methods observed as to the time of picking and in process of curing, that less of Monsoon is needed for a cup than of any other tea, and, in the average use, a pound of Monsoon Tea goes from 13 to 20 cups, farther than its best rivals.

Like others, Monsoon Tea is sold everywhere in sealed lead packets, in five different grades, at 25, 30, 40, 50 and 60 cents., but unlike others, whose varying grades are determined by varying qualities of different mixtures. Monsoon is graded true to its own leaf. The Monsoon in the lead packets, sold by grocers at 25 cents., is just as true in Monsoon quality and purity as any of the higher Monsoon grades at 40, 50 or 60 cents. All the grades grow on the same tea bush—the choicest leaflets, nearest the tips of the bush which possess the most delicate flavors, are selected for the 60 cent. grade; the next leaves for the 50 cent. grade, another for the 40 cent. grade, and the leaves on the lower branches, a little larger and coarser than the leaves higher up, yield the exceptionally good grades sold at 25 and 30 cents. But all are picked fresh and ripe, in the same gardens, and all are cured with the same care, and the Monsoon Indo-Ceylon Tea at 25 cents. direct from the growers, is a purer and choicer tea than the packings of the tea brokers which are offerred at 30 and 40 cents., while the Monsoon grades at 40, 50, and 60 cents. are incomparable. And the reason why Monsoon Indo-Ceylon Tea is so much better than others is because, coming to consumers direct from the growers its choice quality has not been tapped to yield the profits exacted at different stages by the shippers, brokers and the packers of other package teas. These profits fairly average about 10 cents. a pound and Monsoon Indo-Ceylon Tea, while sold at the same price as others, is fully 10 cents. better in value—in quality, flavor and strength.

The Monsoon Tea Company has made a trade mark of its constant use of the quotation, "From the tea grower to the tea consumer" in connection with the sale of its product. Years ago its vast operations were confined wholly to supplying the British wholesale trade—and to this day its product is used extensively to supply the body and flavor for most of the mixed teas sold in Canada. A few years ago the Monsoon Tea Company decided to assure tea consumers of the certainty of getting Monsoon Indo-Ceylon Tea in its original and incomparable purity, by packing its own tea for retail consumption in special packages of its own, under its own name and brand. It uses its own grown high grade tea—and, reaching the consumer direct, it is able to pack a quality of tea of far higher value than it is possible for others to afford, who must first buy of the growers—or of brokers, as most tea packers do.

The steadily increasing popularity of Monsoon Indo-Ceylon Tea since its first introduction in the company's own packets, and under its own name, is due wholly to its surpassing merits as a pure, delicious, wholesome and satisfying tea. The results of the first efforts made by the company to reach the consumer gave promise of the great demand which has since set in for Monsoon, and urged the extensive efforts for its general introduction which are now being made to bring Monsoon into every Canadian home. A short time ago the packet department was made a special branch of the great business, and by means of immense sample distributions of the tea and energetic supplementary work, the packet sales have increased beyond all expectations

The natural hesitancy of retail merchants to increase their stock of package teas which the addition of Monsoon Indo-Ceylon Tea when it was first introduced has been almost overcome entirely everywhere by the demand from the people who, having tried Monsoon, or heard it praised, insist on having it, and who quickly judge a dealer's impartiality by his readiness to supply what they ask for. And Monsoon is now winning the golden favor of the dealers themselves because it is proving a tea of which customers do not tire, and which is growing more popular as its choice qualities become more generally known.

The head offices of the company which supplies Monsoon Indo-Ceylon Tea are in London, England, with immense warehouses in London, Leverpool and Ceylon. In Toronto its warehouse is at 7, Wellington street, West.

TEA, &c., COMPANIES.

Imperial Tea Company, yield to 30th ultimo 2,527,680 lb., as against 2,037,280 lb. to the same date last year, increase 490,400 lb; British Assam Tea Company, yield, 481,520 lb., as against 386,720 lb., increase 94,800 lb.

The Wynaad Tea Company, Limited.—The Directors, in presenting to the shareholders the profit and loss account and balance-sheet for the year ending April 30, 1898, have the pleasure to report that the Peringodde Estate, purchased from Mr. R. K. Walker, has been duly transferred to the Company, and that, on the other hand, the sale of the Nelimunda Estate, sanctioned at the Extraordinary General Meeting, held on May 27 last, has been carried out and the purchase money, Rs.45,000, remitted to London. The operations during the past season have mainly consisted in the erection of the tea factory, the cultivation and extension of the acreage under tea, and the up-keep of the company's coffee and cinchona. The company is now provided with a first-class factory, fully-equipped, and capable of turning out 250,000 lb. of tea per annum. The crop of coffee and cinchona harvested during the season 1897-98 has only yielded a net income of £1,071 17s. 9d. a small amount of pepper, and a first shipment of tea, making up the total to £1,093 11s. 2d. Prices of coffee and bark have ruled much lower than in previous years; the coffee crop only amounted to 11½ tons, and realised 64s. 3d. per cwt. net. The amount charged to revenue account being £2,723, there is a loss of £1,629 13s. 10d. carried forward to the debit of profit and loss. Under these circumstances the Directors regret they are unable to recommend a dividend for the past season. The prospects for the season 1898-99 are much brighter, the coffee crop, estimated at 35 to 40 tons, has been sold to arrive at 78s per cwt. cost freight and insurance, and the pepper crop, chiefly from Peringodde Estate, estimated at 15 to 20 tons, at £45 10s. per ton, landed terms; besides which regular shipments of tea have now begun, and 50 chests are advised as being shipped this month The Directors, therefore, hope to have a balance as the result of the 1898-99 season to the credit of profit and loss account. Owing to the large outlay on the factory and on the young tea on Cootacovil and Chundale debited to capital account, together £4,521 11s. 11d. the company is still considerably in debt, after deducting the amount of about £3,000, realised by the sale of the Nelimunda Estate. The Directors are anxious to reduce the debit balance as soon as possible by the issue of the remainder of the preference shares, amounting to 3,937, reserving the issue of the balance of the ordinary shares, numbering 6,552, for a later period. The above-mentioned heavy outlay is now drawing to a close, and as the

ROYAL EMPORIUM,

w. 1-10-98—t.f.o.]

area under tea, which comprises 580 acres, is gradually coming into bearing, the annual returns should show a gratifying increase during the next few years. The Directors trust that the shareholders, who have done so much for the company in the past, will come forward once more to take up the remaining preference shares, the intrinsic value of which is about £2, taking the value of the company's property cultivated and available for cultivation at over £30,000. Under the new arrangement with the Ceylon Tea Plantations Company, Limited, Sir Willium Johnston has succeeded Mr. F. A. Labouchere as Secretary, and the London expenses will be considerably less than during the past season.

The fourth annual general meeting of this Company was held at the company's offices, 20, Eastcheap, E. C, on Monday the 19th ultimo. The chair was occupied by Mr. James Labouchere, chairman of the company.

The Secretary having read the notice convening the meeting,

The Chairman, in moving the adoption of the report and accounts said: Gentlemen, I am sorry to see so few shareholders here to-day, but I trust that on the other hand it is a proof they have nothing very much to complain of, because, as a rule, shareholders only come in numbers when there are important items to be discussed. The report having been taken as read, the chairman explained that there were only really two great facts to register, one of them being the acquisition of the Peringodde Estate from Mr. Walker, and the other the sale of the Nelimunda Estate for 45,000 rupees—about £3,000. Both these moves on our part have been dictated by the policy that we should try to get our managing director in India to be interested to the greatest possible extent in the success of the company, and we have been able to do that in a very satisfactory manner by securing the Ceringodde Estate for £2,5000 in shares. The Peringodde Estate being situated between the two places where tea has been opened, we selected that estate to build the factory, which is now in the centre of our tea growing, and which will obviate the necessity of making a second factory on the Chundale Estate. The Nelimunda Estate was sold because we wished to reduce as much as possible the risk arising from the cultivation of coffee. As a result we have reduced our acreage of coffee, but we have still coffee enough to bring us in a fair income in fair seasons, yet not too much to risk a large loss if there were a failure of the crop. We have made enormous progress in the planting of tea, having planted altogether 580 acres, which is very good work in so short a time. On the other hand, we have not attained this result without a comparatively heavy outlay, although the cost of the tea per acre has not been high. On account of the amount of money that is due by the company we have decided to stop any further extension of tea for the present. But this question of further outlay is entirely subordinate to the necessity of finding further capital. In looking over the accounts you will see that we had a very poor coffee crop last year, the amount obtained being £1,093 11s. 2d., although the expenditure was no more than that of former years. This has raised the debit to profit and loss account to £2,634. It is with a view of reducing this debit balance and the large amount now due for the building of the factory and the opening out of the tea planting that the Directors are anxious to issue the remainder of the preference shares. We have no definite plan yet to lay before the shareholders, but it is evident that either these shares will have to be taken up, or, as it has been suggested, the preference shres at 10 per cent. be altered to 6 per cent. cumulative preference shares. This plan is especially advisable because we are now getting into smooth water, for besides the coffee, cinchona and the pepper we have on the property, we should have every year an increasing supply of tea. The first bill of lading for 3,970lb. is now to hand, and the production of tea for October amounts to 5,1691b. The results up to the present are very satisfactory, and that when we meet in a year's time we trust we shall have a good report to show. The directors have sold the present crop of coffee, estimated at 35 to 40 tons to arrive, and have also sold the pepper crop, chiefly from the Peringodde Estate, estimated at 15 to 20 tons, so that with this and the shipments of tea we shall have a much better result to show for the current year.

The motion was seconded by Mr. Sanderson, who said that the company were giving the proposal to alter the character of the shares their very serious consideration. They proposed to alter the ordinary preference shares to 6 per cent. cumulative shares. An action of this kind would put their company on a much better financial position. Before any definite steps were taken the shareholders would be called together.

The Chairman then moved the re-election of Mr. Chas. M. Miller as a director. This motion was seconded by Mr. R. M. Inman, and carried unanimously.

The auditors, Messrs. Lovelock, H. W. S. Whiffin, and Dickinson, were then re-elected.

Mr. Sanderson then moved a vote of thanks to the manager and staff in India for the way in which they had done their work during the past season. They had had great difficulties to contend with in building the new factory, and he thought that they thoroughly deserved a hearty vote of thanks for the efficient way in which they had met these difficulties. This was seconded by Mr. R. M. Inman, and unanimously adopted.

The meeting concluded with a vote of thanks to the chairman.

Declaration of Dividends. The directors of the Assam Frontier Tea Company (Limited) have declared an interim dividend of 3 per cent on the preference shares.

The Makum (Assam) Tea Company (Limited) has declared an interim dividend of 2 per cent. (being at the rate of 4 per cent. per annum) on account of the season 1898.

The Board of the Borelli Tea Company (Limited) announce a dividend of 2½ per cent. on the preference shares.

The directors of the Rajmai Tea Company (Limited) announce an interim dividend of 5 per cent. on the ordinary shares.

The directors of the Moabund Tea Company (Limited) announce an interim dividend of 2½ per cent. on the preference shares.

The Board of the Bargong Tea Company (Limited) announce interim dividends of 3 per cent. on both ordinary and preference shares.

	5,274,000	6,903,000	5,587,000

Messrs. Wm. Jas. & Hy. Thompson's report of 21st ult. states :—At the auctions held yesterday the large supply of 4,911 bags was offered, but with a slow demand for almost all kinds a dull tone prevailed, and only about 1,200 bags were sold at a general decline of about 1s. per cwt. Of 486 bags Ceylon only 25 bags sold.

We quote—Trinidad, middling to fine red 74s. to 78s. 0d., gray and mixed red 75s to 76s ; Guayaquil, Caraquez 72s. 0d. to 73s. 0d, Arriba 76s to 81s. ; Ceylon, middling to fine 73s. to 79s. Stock 95,992 bags, against 93,619 bags last year.

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated December 22nd, 1898, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON

FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	930,504 pkgs.	660,714 pkgs.	25,269 pkgs.
1897-1898.	918,820 „	683,126 „	25,023 „

17,151 pkgs. Indian
17,613 „ Ceylon
— „ Java
} Total 34,764 packages were offered in public auction this week.

Duty payments and exports from Great Britain since the 1st Jan. are shown below. Home Consumption of Indian Tea is very encouraging. Exports of both Indian and Ceylon show steady progress

INDIAN. Monday's auction was the closing public sale of the year. With a good general demand, prices were rather dearer, especially for Teas for price and good liquoring invoices. The official Wire gives exports to U. K. for first half of Dec. as lbs. 5,710,000 against lbs. 8.150,000, making total to U. K. from 1st April lbs. 116,757 000, against lbs 115,270.000 same period last season. Taking into consideration the great increase in deliveries of Indian Tea. together with the small increase in shipments, the position looks very strong, while the fact that duty payments on all Tea up to 20th inst are lbs. 1,102,765 over same time last year tends to add further strength to the position.

Ceylon. The last public sale of the year was held on Tuesday. Prices showed some irregularity while slight concessions were occasionally made to buyers. Private telegraphic advice gives exports to U. K. for first half of month as lbs. 4,600,000, against lbs. 3,800,000, and estimates total quantity for the month as lbs. 8,750,000, against lbs. 9,500,000 actually shipped in December last year.

Average for the week 8d., against 8·18d. same period 1897.

Ceylon Tea sold on Garden Account, 1st Jan. to date 1898, 1,077,586 pkgs, av., 7·76d. 1897, 1,049,826 pkgs., av. 7·82d.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 27th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Please note the change of address.

North Mysore. *December* 10. *Weather.*—Has until last three days been cloudy and unsettled. *Plant Diseases.*—Leaf disease in some parts severe. *Crops.*—Are well over estimates and there is a good promise for next year. Crop carts are somewhat scarce this year owing to the absence of Vellore cartmen. *Gram*, *Rice* 12-13 seers per Re. 1. *Gram* 12 seers per Re. 1.

Coorg. Polli Betta, 18*th January.*—*Weather.*—Fine, clear, cold. Some chance of drying coffee now. *Crops.*—Picking still in full swing, except in a few cases where it has been stopped to allow crop to ripen. Estimates have in several cases been already passed. *Plant Diseases.*—Condition of coffee generally good. *General Health.*—Good. *Labour.*—Sufficient.

THE INCREASE OF SALES.

All planters are concerned in attempts to increase the sale of the particular product or products that they cultivate. Ceylon and Northern India tea men are daily agitating this matter, and lately South Indian Coffee-planters have taken it up. Some have suggested that the tea and coffee industries might combine, others regard them as rivals, whose interests must of necessity clash. If, however, the subject be keenly discussed by both tea and coffee planters alike, it may well be that some method of working will be found that will be advantageous to both. For ourselves, we should urge the importance of (1) reducing the cost, (2) improving the quality :

i.e., adapting it to the actual requirements of important markets, (3) increasing the demand in present markets, and (4) opening out new markets. All these points apply to tea as well as to coffee. For convenience, we will merely touch upon the two last in our present issue. As a general rule, theorists say, begin your improvements at home, while practical men often prefer to make their experiments at a distance, so as to reduce the amount of criticism in case of failure. There is no reason, however, why the demand for Tea and Coffee should not be cultivated in India as well as in other countries. Planters may improve demand at home as well as abroad, in fact. It has been widely stated that rubbish is palmed off on the poor native as tea, and parched rice as coffee. Now in considering statements of this kind, when put forward as a hint that all that is necessary is to substitute the right article for the wrong, the genuine for the false, we must not overlook the question of price. Can the planter supply real tea at the price that the native now pays for rubbish ; can genuine coffee be retailed at the price now paid for parched rice sold under the name of coffee? Of course, Government might and should, interfere to protect the poor by means of an effective Adulteration Act, properly applied. But put this aside for the moment: would it not be well for planters to find out the rates at which so-called Tea and Coffee are retailed in Indian petty bazaars with a view to ascertaining whether they themselves could place a pure article—of however low quality—on the market at similar rates? The taste of the lower classes cannot be "educated," it is with his small means alone that we have to deal. The safest assumption is that he cannot afford to pay more than he pays now, be the quality of the article offered him what it may.

Some interesting remarks appear in the *Indian Sportsman*, and we give them elsewhere—though we by no means agree with all our contemporary says. As to the utility of the middleman there can be no doubt ; all that has to be guarded against is abuse of power or of trust on his part. He must be held in check. Should any of our readers hold the belief that the middleman is unnecessary, and that the planter should place his produce direct in the hands of the consumer, we would merely ask him to study the question as a part of the much larger question of the Division of Labour. If once it were admitted that planter and consumer could trade together to the best advantage, we should have to argue also that every man would be the best producer of his own requirements, and we should come back to the old, old example of the pin-maker. Division of labour is as much necessary in trade as in the cultivation of a tea estate. There is room for the middleman, and there is need for his employment. A man may be an excellent planter but a poor salesman, or a connoisseur in tea but a bad buyer. Between the excellent planter and the consumer or connoisseur the middleman is at work, and if he works well and honestly all parties profit, even if all be not at all times satisfied. Whether the middleman be independent, or in the direct employ of the planter, or retained by the consumer, is a point of detail. The planter is a specialist, the middleman should be a specialist. Some consumers are specialists in their way, but the onus of finding out the requirements of each and all falls upon the middleman. There is a great deal to be said in support of a system of "sampling" on the part of planters, because samples enable the middleman to test demand *practically*. Qualities are approved or disapproved, and according to the opinions expressed the requirements of a particular market are gauged. There is little to be said in favour of the idea of planters starting their own tea and coffee shops in distant places. This plan does not dispense with the middleman. It merely substitutes one for another. You may go past the wholesale grocer, and even the retail grocer, but you must have a staff to sell, and the possibility—perhaps, indeed, the probability—is that the staff would take such advantage of inexperienced and absentee employers that the profits that would have gone to the grocer would be fully absorbed elsewhere.

Although there is much in the *Indian Sportsman's* remarks that appears to us out of place, we should like our readers to study them carefully, and to consider the different aspects of this question before coming to a decision. Advertisement is a great thing, but it will not sell an unsuitable article in any large quantity. As regards home and other markets, the requirements of each must be ascertained and met. That is the first principle of the problem of increasing sales. Offer the right article at a fair price, and rely upon it there will be a demand. As regards the question of middlemen, planters should certainly co-operate, not perhaps for the purpose of transacting all their own affairs from seed to cup —for this is altogether too large an order for the present— but for the purpose of gaining the strength that comes from union. This gained, they can dictate terms to some extent, instead of being always dictated to. They can go past *some* middlemen ; they can select their own channels for the conveyance of goods to market, and they can no doubt effect economies in the cost of transit. If the thing could be done, we should like to see a huge scheme of Co-operation carried out ; but it cannot, and we would urge upon planters that even such a scheme does not mean the entire abolition of the middleman It merely means the substitution of "mutual" principles for those of ordinary trade. It would be impossible for planters to conduct every stage from the estate to the consumer's house. The middleman must be employed, be he grocer or be he coffee roaster, or tea packer. As between a *small* co-operative scheme and the use of wholesale and retail grocers as middlemen, the advantage of economy lies, we feel sure, with the latter—at least as regards trade outside India. In India again, the *Native* middleman must be taken into account, for he offers cheaper distributing machinery than any European co-operation could influence. The increase of sales can, for the present, be better effected by co-operation with reliable middlemen than by co-operation among planters alone. If South Indian planters would manifest a greater desire to discover the requirements of markets, to reduce cost to a minimum, and to adopt the most approved methods of cultivation and manufacture or preparation, they would very soon

reap the fruits of this policy. Many of them are doing so already, but there are many others who stand apart from these.

POLLENIZATION.

We did not comment at once upon Mr. G. R. Oliver's letter on Male Coffee Plants, which appeared in our last issue, for we wished to allow our readers time to make their own remarks. Apparently, Mr. Oliver has still lingering doubts as to the utility of male plants. He may dismiss them. In the plant world as in that of human beings, sexual laws prevail. There must be male as well as female, and the one without the other cannot prosper. There are cases, of course, where the two sexes are combined in one plant; there are others where they are separate. There is none where one sex can continue the species alone. In one way or another the two are brought together. We hear from California of a large French prune orchard, where the plants grew well for seven or eight years, yet never fruited. Bees were introduced, and a year later there was fruit on the trees. To test the matter more closely, one expert wrapped up some of the limbs on pear trees, so that the bees could not reach them. There was no fruit whatever on those limbs, and no trees that were guarded against the bees. Then, again, a row of French prune trees was planted at one side of a twenty acre orchard. Never a fruit during seven years. At last, however, a row of Silver prunes were planted directed alongside, and as soon as these bore fruit, and not before, the French prunes also bore fruit (for the first time). This points to a distinct pollenization of the blossoms between the two trees, a coming together of the sexes, in fact. Just as clear is the lesson to be derived from the following experience. English filberts were planted. They grew well, but did not bear. The male blossom came out in the autumn, the female not till the spring, by which time, of course, the male blossom had fallen off and dried up.

There is room for further study of the sexual life of plants, and as tea and coffee planters in India have excellent opportunities for conducting investigations and experiments, we would commend the subject to their very earnest attention, for it has a most important bearing on the improvement of species and the building up of disease-proof plants. It is a most fascinating subject, too, and will well repay study.

WEEDING.

WEEDING might almost be termed a neglected science. To many planters it is a new science; to not a few it is no science at all, but an irksome and often unexecuted labour. Modern agricultural science, however, recognizes that vegetable as well as animal pests have to be dealt with, and it has laid down the principles of weeding on such clear lines that no man need be ignorant of the best means of clearing them off his land. It is pointed out that the chief aim should be the stoppage of reproduction. The production of seeds must be prevented, and if the plant is a biennial or a perennial the rootstock must be killed. The Washington *Farmers Bulletin* No. 28, upon which our present remarks are mainly based, remarks that the processes by which seed production may be prevented or rootstocks killed are comparatively simple in most cases and in none impracticable. Nevertheless, when weeds have become abundant and widely distributed, the conditions under which many of them occur are such that the planter is apt to regard extermination as an impossibility. In such cases he attempts merely to reduce them to a state of comparative harmlessness. For example, one can scarcely imagine any sane man undertaking the extermination of Spanish needles, beggar tricks (*bidens bipinnata*) from some of our South Indian hills. But a man may at least attempt to reduce this weed to subjection within a certain area, and it may be useful to him to know that it is an annual, propagated by seeds, which are to some extent distributed by animals, and that prevention of seeding is the most effective method of eradicating it. Within the limits of an ordinary farm any species of weeds can be subdued and controlled: within the limits of a tea or coffee estate a great deal can be done to mitigate the evil effects of weeds. The most useful element for the destruction of seeds is fire, but even where this cannot be resorted to a great deal can be done by careful cultivation. There are some weeds that are perhaps beneficial rather than injurious, and that should therefore be allowed to grow in moderation. There are others, however, that are entirely harmful to either Coffee or Tea, and that should therefore be ruthlessly exterminated.

A writer in *Indian Gardening* refers to the Giant Polygonum as being as obnoxious as it is useless, and as far more destructive than "sorrel" and passion flower. He says that it has got to Nadivattum, where it has spread royally. Can any correspondent tell us what plant this is? Is it the *Polygonum pennsylvanicum* (pink flower) or the *polygonum convolvulus* (white flower) or some other variety? Is it an annual or a perennial, when does it flower, and where does it particularly flourish? Presumably the best method of eradication is by preventing the production of seed, but without fuller information it is impossible to say what is the best way of carrying this out.

RUBBER AND COFFEE.

Mr. W. Rhodes James, of Coonoor, has asked the Editor of the *Ceylon Observer* if he can recommend any short description of Rubber cultivation, more especially as regards Castilloa in conjunction with coffee as a possible shade?

Hevea is, Mr. James understands, a surface-feeder and would not therefore suit coffee; regarding *Castilloa* the information especially wanted is:—

Suitability as shade for coffee.
Distance for planting.
Returns per tree at 3,000—4,000 feet elevation.
Has it been tried successfully as a sole product?

Our contemporary remarks on this:—Our compilation of available "Rubber" information for the planter is in the printer's hands. Castilloa is just as much a surface-feeder as Hevea and we have the authority of the Director of the Botanic Gardens for saying this; and neither of these rubbers will do well above 2,000 feet.

This, however, scarcely tallies with information derivable from other sources. The *Castilloa elastica* is a native of Panama, but is also indigenous to Mexico. In Panama it grows in damp wooded ravines along the edges of streams. In Mexico it is chiefly found along west coasts at altitudes running from 1,200 to 1,500 feet, and principally by the river

meadows. Messrs. J. P. William and Brothers, of Heneratgoda, Ceylon, in their "New Product Circular No. 32" described the tree as thriving from the sealand up to 3,500 feet, and remarked that inundated places should be avoided, and that shelter is required in strong windy situations. The information most likely to be of use to Mr. Rhodes James, however, comes from Mexico, where it is common to prepare the ground much the same as for coffee. Indeed, the impression that rubber grows in swamps is described as entirely eroneous, *Castilloa elastica* "requiring practically the same kind of ground and conditions as coffee." From 200 to 350 acres are planted to the acre, and at the age of six years the rubber tree will attain a diameter of from 12 to 15 inches and a height of 25 to 40 feet, and will yield six pounds of milk per tree, giving about 2½ lbs. of dry rubber per tree. This increases to about 3 lbs. when full growth is attained. After the sixth year, little expense and care are required further than to gather the milk and cure the rubber, so that the planter may expect a net income of from 200 to 450 dollars per acre per annum. Another report gives a much lower estimate: 200 trees to the acre, 1 to 2 lbs. of rubber per tree per annum, deducting freight to market, net returns 100 to 200 dollars an acre by the seventh year; by the fifteenth an average yield of *5 lbs.* per tree.

There is probably not much information available that would afford a clear guide to Mr. James as to the suitability of the *Castilloa* as shade for coffee (beyond the fact that it requires a similar soil), or as to the cost of planting and the returns *in India*. If either he, or any other planter, desires more detailed information on any point, we shall be glad to furnish any that is within our grasp. We have refrained from commenting much on Rubber cultivation hitherto, under the impression that few, if any, planters in Southern India were taking more than an experimental interest in the matter. If others besides Mr. James are going beyond this, or even contemplate doing so, we shall be very glad to go deeper into the subject in future issues.

PEPPER.

Several papers that we have recently published have foreshadowed an important rise in prices of Pepper. This week's advices from London mark another advance, and one that should strike planters' attention. Considering that it was holiday time, the "boom" was remarkable. There is probably a good deal of speculation at the back of it, but none the less will shippers rejoice to see what has occurred. After selling during the week at 4 11/16d. usual terms, Tellicherry Black rose to 4 13/16d. per lb., c.i.f., delivered weights, and 25 tons were sold at this figure for January-February steamer to London. Granted, too, that speculators are at work, there is a solid foundation for their operations. The *London Commercial Record* goes the length of saying that there can hardly be two opinions about the future of Pepper. With declining stocks everywhere and short crops in almost all the pepper-producing countries, the only possible conjecture it can arrive at is that the value of all descriptions of pepper will shortly experience another improvement. Reports from the Straits are unanimous in predicting a falling off in supplies. Lampong is also reported short, and Tellicherry speaks of late unseasonable rains, which have done great damage to the growing crop, and thinks that, at the outside, a total yield of about 3,500 tons may be expected. The *Grocer* has taken a somewhat similar view, and although pessimistic reports from producing centres are regarded with suspicion by London operators there are certain facts that cannot be disregarded. Thus the *Record* says:—"We cannot close our eyes to the fact that such unusual and heavy rains as have visited the Indian Pepper districts in November, must have caused considerable damage to the young crop. An estimate of 3,500 tons growth only appears to us, therefore, by no means improbable." Another fact, which in time may prove of the greatest importance, is, it is observed the spreading of the plague towards those pepper districts. "If the Government should fail in arresting the plague, its appearance in those regions will have a most disastrous effect on the Native population, inasmuch as it will create a great difficulty in gathering the crop and carting it to the usual export ports. This is being recognised in India already, and Native dealers and speculators are laying in as much stock as they possibly can in anticipation of a boom. In this belief of an early rise they are furthermore supported by a strong demand from the Straits, which, in itself, is a proof of the shortage of the crop there." Our contemporary adds:—"Native capitalists in India have once more adopted their old tactics of buying up all they can, and holding their stocks—if need be for years—waiting patiently until buyers are forced to pay the profit they demand." As there is likely to be more demand, the following figures showing the exports from the usual ports may prove of interest and value to our readers:—

	To Europe.	To India.
1896.		
January to November	about 2,600 tons.....	about 3,200 tons.
1897.		
January to November	„ 4,800 „	„ 2,200 „
1898.		
January to November	„ 1,350 „	„ 3,450 „

A close competition between India and Europe is likely to arise this season, and higher prices will probably result. This is good news for pepper growers, and should satisfy them that even short crops are likely to prove very profitable this year.

THE U. P. A. S. I. SECTION.

[Under the Control of the Secretary, U P. A. S. I.]

In the Board of Revenue's Report on the operations of the Department of Land Records and Agriculture during the year 1897-98 there is the following paragraph regarding Entomology:—"At the instance of the United Planters' Association, relying on the success of Hawaiian and American experiments for the extermination of scale-pests, Government decided to give a grant-in-aid of the deputation of a planter, in the absence of a skilled Entomologist, to Australia, to collect and bring to India a consignment of lady-birds which, it was hoped, would prove destructive of the scale-pest on coffee. Mr. Newport proceeded to Australia late in the year and appears to have received all possible aid and advice from the Australian authorities in connection with the collection of lady-birds; but unfortunately the consignment he brought back failed to survive the voyage."

* * *

In its review on the above report the Madras Government observes: —"The Government aided with a grant the experiment conducted by the United Planters' Association of bringing from Australia the species of Lady-bird likely to be destructive of the scale-pest on the coffee plant. It is much

to be regretted that the consignment failed to survive the voyage."

***

Yet another remark on the same subject. In the Entomologist's report that is included in the Annual Report of the Queensland Department of Agriculture for the year 1897-98 we read :—"The part taken, from the time of its inception onwards, by this Branch of the Department in furthering the knowledge of useful insects has been specially recognised during the year by the arrival of Mr. Howard Newport, a duly accredited agent of the Government of India and of the Central Indian Planters' Associations, to whom had been committed the duty of introducing scale-eating beetles to the peninsula as a means for contending with the various pests inimical to the successful growth of the coffee therein. Instruction was imparted to this officer—whose zeal and ability specially qualified him for the work entrusted to him—as to the localities where the various insects in quest were procurable, their habits, the means to be adopted for obtaining them, as well as regarding their generic and specific determination. And Mr. Newport having already left this colony in the possession of a large number of living Lady-birds, including *Cryptolæmus Montrouzieri*, *Orcus australasiæ*, and *Rhizobius ventralis*, as the outcome of his assiduous labours prosecuted continuously during several weeks in the face of somewhat adverse conditions, there are good grounds for anticipating the ultimate success of his mission."

***

Unfortunately, that success was not to be! But there is time yet to make up for past non-success.

***

In the Queensland report there are two interesting paragraphs about the cultivation of Coffee in those parts The Overseer of the State Nursery at Kamerunga states that considerable excitement has been evinced in regard to this plant during the year. It was feared the dreaded leaf disease had made its appearance in one portion of the district, but from the Entomologist's Report on that district there is no sign of that disease. The Overseer proceeds :—"There is one disease, however, at this Nursery as reported last year, and that is the drying of the pulp on to the parchment. This prevents the berry from being properly pulped when first passing through the pulper. Liberian and Maragopipe varieties are quite out of the question, they both being of peculiar growth and subject to the pulp adherence disease. I fear the climate conditions below the Range are too forcing Inquiries have been received from all parts of Australia regarding this plant by persons wishing to experiment. Queensland coffee yields a small berry, but is said to have a better flavour. Considerable areas have been planted in parts of this district, and several coffee pulpers have also been introduced."

***

And in the Annual Report (dated 30th June 1898) itself, there is the following :—"The interest that has of late years been shown in this product is now developing itself, principally in the tropics, by the establishment of plantations by private individuals and by joint stock Companies. Though the advance in the area is not yet great, it is sufficient to show that there is confidence in this product. The statistics for the last two years are :—

	Area under coffee.	Production.	Average per acre.
1896 ...	138 acres	9,707	70·34 lb.
1897 ...	311 „	81,614	262·42 „
Increase	173 „	71,907	

Though the average return per acre is here given, it is not quite fair to strike an average in connection with the cultivation of coffee, because upon the area under this plant, there is much variety in the various stages in which the trees thereon are with regard to their maturity, and, moreover, many of the plantations, although planted out, are still in their infancy. Of the total area under coffee, some 275 acres have been planted in the Northern district, 29 acres in the Southern, and 7 in the Central. It will thus be seen that the Northern district greatly preponderates as regards area, and will no doubt continue to do so. Statistics are not yet available as to the profit to be obtained from these plantations, sufficient time not having yet elapsed to decide this matter from a commercial view, but, so far as is known, those whose plantations are sufficiently advanced to return a partial if not a whole crop are apparently satisfied with their lot, and nothing has yet been heard of the abandonment of the cultivation of this plant. Coffee has been grown in isolated parts for many years, and at Mackay one grower has for a long time placed his product upon the market, but it is only now that definite steps have been taken to establish plantations upon a commercial scale.

COFFEE IN QUEENSLAND.

WHEN, in the *Cairns Argus*, an illustration of apparently large sized coffee bushes, in the neatest and primmest of rows, struck our attention, we began to think that coffee was something more than a plaything in Queensland. A neat little shanty in the background might be the planter's bungalow, or something less pretentious ; but about the field of coffee with ne'er a shade tree except one in a remote corner there would be no mistake, for the word "Coffee" was struck right through one end in letters ⅜ of an inch larger! It was, in fact, an advertisement of "Mount Graham Coffee" that attracted us—describing this coffee as of the purest quality grown by D. R. Lewis, at his Mount Graham Coffee Plantation, Russell River, North Queensland and manufactured at his establishment, La e Street, Cairns. Here is an excerpt :—

THE Coffee is of the finest **Aroma and Flavor.**

"UNIVERSALLY USED throughout North Queensland, and pronounced Superior to all other Coffees."

"There is no better or Purer Coffee in the World than Lewis' Mount Graham Coffee."

The following particulars with reference to the above estate are given by a special reporter of our Cairns contemporary and may interest some of our readers :—

During the past few years the cultivation of coffee has had an ever increasing amount of attention paid to it in the Cairns district. True, the area under coffee at present is not great, but it is gradually growing and as the district contains a practically unlimited area of country adapted for coffee growing there are not wanting enthusiastic planters who aver that coffee growing is destined in the course of years to develop into the principal agricultural industry in this part of North Queensland. Climate, soil and rainfall are all eminently favorable to coffee growing. The greatest disabilities the planters have had to contend with so far have been a dearth of suitable labor and a fairly general ignorance as to the proper methods of preparation for market. Nature does her share, as the excellent raw produce attests but until an expert has enlightened the struggling pioneers the second disability will remain It is understood that the petitions of the farmers have roused the Government to a sense of the necessity for an expert to advise and instruct the growers as to the best means of preparing

their coffee for the market and that negotiations are now in progress with a gentleman in India well versed in coffee, with a view to securing his services as a coffee expert.

THE MOUNT GRAHAM ESTATE.

Coffee holdings are to be found in various parts of the extensive district of which Cairns is the commercial centre. At Kuranda and Myola on the Cairns-Herberton line, at Hambledon and on the Lower Russell. All these small holdings have been more or less successful but those in the Russell District, owned respectively by the DeMoleyn Bros. and D. R. Lewis can safely claim to be the estates on which coffee growing has been carried out on the most comprehensive scale. It is with Mr. Lewis's estate, colloquially known as Mount Graham, that we purpose to deal with particularly just now.

PIONEERING.

It is now some 15 years ago since Mr. D. R. Lewis, perhaps better known locally as "Coffee Lewis" took up land at Mount Graham on the right bank of the Lower Russell, armed with some slight knowledge of coffee growing and manufacture gained in Ceylon and an indomitable determination to win, Mr. Lewis set himself the uphill task of growing coffee at a profit at Mount Graham. A visit to that picturesque estate and to his factory in Lake Street will give a fair idea as to how far he has succeeded.

The Mount Graham Estate consists of about 260 acres of which 85 acres are cleared. Of the cleared area, 25 acres is under coffee, and 20 acres more is in readiness to receive new plants, while an orchard occupies about 10 acres more. I had always been lead to believe that a sheltered situation was the prime essential in choosing a site for a coffee plantation. Mr. Lewis evidently held that opinion when he chose Mount Graham, for no better sheltered spot could well be conceived. The estate is situated on the inward slopes of the coast range immediately overlooking the tortuous, sluggish Russell. The buttress of hills protects it most effectually from the prevailing South Easterly blow and an accommodating spur running out at right angles from the main range performs the same motherly office when the "Northers" prevail. The coffee trees are planted on the slopes of the hill, the diagonal method of planting having been adopted. It is claimed for this method that it gives the maximum number of plants to the acre - about 24 more trees to the acre than the usual plan. The land, originally dense tropical scrub, is not thoroughly cleared. Here and there a stump or a log may be seen among the coffee trees which Mr. Lewis claims assist to shelter the tender plants. At the outset Mr. Lewis planted three acres, say 2.500 plants, and that area has been gradually augmented every year until now there are about 25 acres under coffee, fully one half of which is in full bearing. Some three years elapses after planting before the coffee plant returns a crop. Mr. Lewis pins his faith to the Arabian variety of coffee (best Mocha) and cannot see any virtue whatever in the Liberian variety.

MANUFACTURING.

For some years past Mr. Lewis has been manufacturing his own coffee at Mount Graham, with machinery procured for the purpose, and so far has found a ready demand for all his produce. The Mount Graham coffee tins may be seen as far down the coast as Rockhampton and as far west as Hughenden The manufacturing appliances at Mount Graham are a tribute to the ingenuity and the perseverance of Mr. Lewis. The motive force is supplied by a large water-wheel. the water being lead down a gully by a long section of troughing. From Mount Graham the manufactured article has to be ferried across the Russell and then packed to Aloomba whence it comes into Cairns by the tram But this system entails a considerable loss and inconvenience, so Mr. Lewis has determined to do all his manufacturing. in future, in Cairns. The newest and most improved machinery is already in position in his Lake Street premises and the coming crop will be treated in Cairns.

LABOR.

The Labor difficulty in connection with the growth of coffee is a topic on which a good deal has been written and spoken of late. An impression prevails in many quarters that coffee growing can never assume vast proportions in North Queensland as an industry on account of the dearth of cheap labor to pick the crop. Mr. Lewis. like most of the coffee growers in this district found the native aboriginals both numerous enough and apt enough for all the work required of them. When the area under coffee multiplies itself four or five fold the labor problem may be a real difficulty, but at present it is by no means insurmountable.

PROSPECTS.

The decision of the Cairns Divisional Board to extend their tramline into the rich Russell country, means a lot to Mount Graham. The line will probably pass within a mile of Mount Graham and will do away with the tedious journey to Aloomba per pack-horse. This and the greater facility in the receipt of goods and the despatch of produce will constitute no insignificant advantage.

In conclusion a visit to Mount Graham besides demonstrating that coffee can be successfully grown on a large scale in the district, will also furnish a convincing object lesson as to what can be done by pluck and perseverance under adverse circumstances. The comfortable homestead established at Mount Graham is solely the result of a pioneer's hard and unremitting toil for 15 years. Certainly Nature on the Russell is inordinately kind to the coffee planter. The soil is excellent, the situation uniquely suitable and the rainfall bounteous. But Mount Graham, although perhaps the pick of the Russell country from a coffee-grower's aspect, by no means absorbs all the natural advantages of that highly favored region.

Apropos of prospects, Mr. Valentine Webster, one of the proprietors of the Co-operative Tea Gardens Company, of Colombo, who was recently in Queensland, informed a representative of the *Bulletin* that he was one of the inspecting directors of the Mackay Coffee Company, and as such had been noting the progress of the industry throughout his Queensland trip. At Cairns there was room for a big extension in the way of coffee production, although growers had yet something to learn in the way of details particularly with regard to processes necessary after the berry is picked. The Mackay Company were going in for coffee growing on a large scale, having 85 acres under cultivation. When in Brisbane he intended interviewing Mr. Chataway on the subject of protecting the industry, holding that the present duty of 4d. per lb is not sufficient to protect the Queensland grower from cheap American coffees. With 6d. per lb on tea and 8d. on packet tea Mr Webster thinks the Government should increase the duty on coffee to 6d. With regard to tea, Mr. Webster considers the soil and climatic conditions of Queensland suitable enough, but the want of labor at a price to compete with other countries renders tea growing in Queensland an impossibility. On the other hand, there is, he thinks, a big future for coffee under favorable auspices.

NOTES.

Mr. H. O. Newport.

Mr. H. O. Newport has been appointed a Member of the Planters' Association of Ceylon.

Coffee in North Wynaad.

Very little is heard from this quarter now-a-days. We should be glad to know if any real progress is being made in the district.

Imperial Penny Postage. The Planters' Association of Ceylon has recorded a hearty vote of thanks to Henniker Heaton, Esq., M.P., for his untiring efforts in furthering the cause of Imperial Penny Postage.

"New Crop" Coffee. In their report dated 30th ultimo, Messrs. R. J. Rouse & Co., of London, remark :—"The first shipment of new crop East India has just arrived per S.S. *Clan Mackinnon* and will probably be catalogued next week."

Rio Coffee. The *Rio News* (November 1) says : "There is no news in regard to the growing coffee crop, and 'no news is good news.' There has been much warm weather, followed by showers of rain, which is considered particularly favorable to the development of flowers and fruit."

Nilgiri District Association. An Ordinary Meeting of the Members of this Association will be held at the Masonic Hall, Ootacamund, on Friday, January 27th, at 11-30 A. M. Members wishing to propose a resolution at the above meeting are referred to Rule 7 as containing the procedure to be adopted.

The Calcutta Tea Sales. At the sales at Calcutta, on 13th instant, 15,000 packages were sold. Souchong kinds were quoted from one to two pies dearer. The market was generally firm. Recently the usual average price at the Calcutta sales has been 5 annas 8 pies. The first sales this year, however, touched 5 annas 11 pies. It is a good omen.

The London Tea Market. In their cable of 12th instant to Ceylon, Messrs Gow, Wilson and Stanton, report a steady market, with quotations unchanged. Pekoe Souchong 6½d. average 8d. Reuter states that 26,000 packages were sold out of 28,000 offered. Of Indian, 42,000 out of 46,000, the average being 8⅞d. which shews a rise of ¼d.

Ceylon Tea Estimates. A Special Committee of the C.P.A. has been appointed to consider the returns received from District Associations and to report before the 17th February, 1899 ; and the Ceylon Chamber of Commerce is to be invited to nominate two members of the Chamber to confer with the Special Committee of the Planters' Association, especially as regards the probable distribution of the crop.

Tea for Price. It is said that low price is everything in the London Tea market. That it is not so in the United States, would appear from the following remarks of the *American Grocer* that tea for price "is what every dealer is looking for, and since the imposition of the duty the task has not been so easy as previously, for 'tea for price' means that quality plays a more important part in adjusting values than ever before."

Co-operation. A "coffee-man" writes :—"Where is the money to come from ? We are too poor, and wanting in unity, and the men who have made their money will be quite content to go on as they have done. Bad exchange is not what we are suffering from so much as low prices, and extravagance in working. Hard times are ahead of us, and unless we can get our coolies to do more than two annas work for four annas pay, we shall find ourselves in a fix."

Pest-preventive measures. The Ceylon Planters' Association has resolved :—"That Government be asked to arrange for the proper Inspection and Fumigation of all Imported plants and fruits and Tea Seed on arrival at the port as the Committee considers the need for these precautions is of the utmost importance in the interests of the Horticultural Industries of the Colony. Further the Committee understands that the treatment has no injurious effects to either plants or fruit, and therefore cannot in any way check the trade in them."

The London Tea Market. The Ceylon average in 1898.—Messrs. Gow, Wilson & Stanton in their annual report say :—"The Ceylon crop has been a very fair one and fully up to the average in quality, although some slight disappointment is generally expressed by growers in reference to the quantity, which has fallen somewhat short of their expectations, the latest estimate being placed at 119,000,000 lb., against an outturn of 116,000,000 lb. in 1897. The average price for the year 1898 was very little below that of 1897, *viz.*, 7·76d. against 7·82d., and in 1896 8·21d."

The Currency Committee. Mr. A. L Cross writes from Edinburgh to the *Ceylon Observer* :—"Unless producers can make a big row in Parliament over the exchange question as affecting producers you may depend on it the present Government will impose a gold currency in India. The formation of the Currency Commission is simply scandalous. It is almost entirely composed of men pledged to play into the hands of the Indian Government. I wonder why the Native States of India don't make a noise about it." Imagine the Native States of India doing any such thing !

Ceylon Tea in America. Mr Finlay Acker, the leading grocer of Philadelphia, has expressed the opinion that Ceylon Tea in itself will *never* become palatable to American people. He says :—"What may be the *reason* it is hard to state, unless it is that the climate is such that people are affected by it in their taste for food. However that may be, the fact remains that Americans do do not like heavy teas, but shew almost an universal preference for the lighter kinds Only those who arrive comparatively fresh from England appreciate the merits of that class of tea generally characterized as English Breakfast."

Colombo Tea Sale. At the public sale of tea at Colombo on 11th inst., about 8,153 pkgs. = 616,715 lbs. were offered, of which about 7,016 pkgs. = 537,263 lbs. were sold. A very firm tone prevailed at the auction, especially in common leaf grades, which were keenly competed for, and showed a slight advance. Medium and fine broken were not in so strong demand. The *Times of Ceylon* states that amongst the finest teas offered were : High Forest, Middleton, St. John's, Agra Ouvah, Glasgow, and Iona. Amongst low-grown teas good invoices were offered from Farnham, Pallegodde, Knavesmire, and Razeen.

A proposed "Tea Dust Company." A Ceylon planter suggests the formation of a "Ceylon Tea Dust Company" started to purchase and

dispose of all the Dust Tea manufactured (in Ceylon Factories) for consumption within the Island. This would, he thinks, not only reflect to their credit as a laudable philanthropic move, but as a scheme which must undoubtedly in the near future prove a very remunerative undertaking. He adds that, it would be to the interest of all planters to bind themselves to sell their Dust Teas (*bonâ fide* dust only) to such a Company at say 15 cents. a lb., packed in chests and delivered in Colombo.

Costa Rica Coffee. The Director of Statistics of the Republic reports that the exports of coffee for the fiscal year ending June 30, 1898, were 297,491 bags, or 35,461,407 pounds, an increase of 2,000 bags (264,000 pounds) over 1896-97, and 6,000 bags (792,000 pounds) over 1895-96 :

Weeds. Commenting on our recent remarks on the oxalis, a Nilgiri correspondent of *Indian Gardening* writes that "Poonac" has nothing to say to the introduction of it, the spread may be traced to the use of manure near which the oxalis has shed its seeds or bulbs. The real origin may be traced to some flower garden where it has been grown as a "pretty flower," and the commoner variety, without a flower to recommend it, has got in with other seeds. At the "Woodlands" Estate in Ootacamund the devastation caused by it may be seen ; it is in vain the unhappy owner strives to eradicate it : up it comes more vigorously than ever, all the stronger for having the earth loosened. In private gardens it has found itself a home in the turf about, quite ousting the grass. Cattle will not eat it : in time, if it spreads as it is doing, there will be little left of pasturage of any kind.

Insect Pests on the Hills. "Asphodelus" inquires in *Indian Gardening* if any one has tried sulphur for the blight known as "American." We fancy any answer to such a question must be of an unreliable character. Planters' nomenclature of pests and blights is sometimes puzzling, and we think District Associations would confer a boon on the community if they would assist in collecting a list of all known pests and blights, with such descriptions as are available and the local names. This with a view to compilation of an "official" list for general use, and the preparation of hints as to remedies and preventives. As regards "the large aphid," referred to by the same correspondent as attacking his pear-trees, he should try a weak wash of kerosene oil or phenyle, applied with a brush. Apply either in the evening or on a cloudy day. One part of kerosene emulsion to 80 parts of water : or one part of phenyle to 200 parts of water. Follow up phenyle next morning with a liberal application of fresh water, and water nurseries with a weak phenyle wash.

Coffee and Co-operation. The Nilgiri correspondent of the *Planter* considers it very satisfactory to find that coffee planters in Southern India are seriously considering the expediency, nay necessity, of offering their produce to the consumer in a condition ready for use. But he cannot understand why the Company supported by the Shevaroy P. A. should be started in London, when India offers such an inexhaustible field for its operations. The natives of this country are great lovers of coffee, and their taste at present has to be satisfied with the merest flavouring. He adds :—"Parched rice serves in India the place that chicory does in Europe : and often times the parched rice has the name of coffee without even the odour. . . . . Let the planter, instead of starting his Company in London, adopt the far more practical measure of adding to his garbling machinery a roasting, a grinding, and a canning department, and send his produce out ready for use, and the consumption in India alone will be wonderfully increased." The *curing* process is skipped !

Great Wits jump together. Co-operation in regard to the sale of coffee has been suggested. Just about the same time an Indigo Planter has put forward the following suggestions, which seem to him feasible and certain to enhance the value of indigo, and in time fix it on a firm basis. The main point is, he says :—Producers should approach the consumers, either direct or through duly appointed local agents. All producers should combine and appoint a chief agent either in Calcutta, Madras or Bombay (whichever port is most convenient for export purposes). This agent to have the entire management of the sale, export, etc., and all correspondence between the producers, sub-agents and consumers carried on by them. Sub-agents ought to be appointed in all countries where the consumers carry on their trade. He adds :—"Simple advertising will have no effect. The article must be placed in the hands of the consumers direct, and by those most interested (not by a third party), and all advantages derived from a natural dye over artificial ones pointed out to them." These are only broad outlines, but perhaps our coffee friends may find them interesting.

Coffee under Lime Trees. "Gardenia" writes to the *Planter* to state that in his district—he does not say which it is—coffee trees will, and do, grow not only when planted in close proximity with lime trees, but even when growing directly under the branches of these trees. He says :—"I have growing in my garden several gigantic lime trees, whose top branches meet, and intertwining form cool shady arbours. Under the shade of these limes I have a few coffee plants of the Liberian variety which have been producing abundant fruit for at least ten years. The leaves of these coffee plants are large, and of a dark glossy green colour, while the fruit is rather small, encasing small brown berries, which, when properly prepared, make a very delicious and most fragrant beverage. A year ago I planted a few dozens of very healthy looking coffee "pullies" on a small piece of land behind my bungalow, I had the ground well manured and properly prepared, but there were no trees on it, certainly not one "voracious" lime tree, and yet I lost every one of those coffee pullies They gradually drooped and gracefully faded away."

The Depression in Coffee. Following up our remarks in last issue, we note with pleasure that a more hopeful view is beginning to be taken in quarters that more recently ranged on the side of the pessimists : but the change is partly attributable to fresh talk of an American

duty on Coffee. The *American Grocer* remarks, for instance, that "As there is renewed talk of a duty on coffee, we may see a repetition of the movement last spring, when deliveries exceeded 900,000 bags in one month. Very heavy purchases have been made recently by parties who have talked bearishly on the general situation, possibly in anticipation of a duty being levied. The total sales in November for future delivery on the Coffee Exchange, were 306,000 bags. The lowest price was 5·15 cents. for November, and the highest 6·20 for October. The lowest official spot quotation for No. 7 was 5⅞ cents.; highest, 6⅜ cents: average for the month, 6⅛ cents.; Padang Interior, 24½ @ 25¼ cent; fair to good Maracaibo, 7·94 @ 8.65 cents. There is much in the above to encourage a liberal carrying of stock. Light receipts in Brazil, good consumptive demand, possibility of a duty, low prices are all in favor of keeping the stock of raw coffee in good volume."

The Wynaad. A writer in the *Planter* has been "booming" both North and South Wynaad, and although, unfortunately, the P. D. has played the mischief with certain names, the following brief extract may be taken for the benefit of our readers:—"South Wynaad contains a number of very fine coffee estates, some of which, over 36 years old, are now maturing phenomenal crops, while the tea, which has been opened almost entirely upon lands once covered with coffee bushes, has been pronounced on competent authority to be equal to anything of the same age in Ceylon. Assam Hybrid, Indigenous Manipuri, Jettinga, and Longai being so far most in favour; and as the experience hitherto acquired in Wynaad has demonstrated that tea will flourish luxuriantly, if well planted, upon lands originally under good coffee, a vast extent of land suited for tea is available, both of the class described, and of "bamboo jungle" which appears equally well adapted for the profitable growth of tea. Vargiter, [*sic*] which is the oldest planting centre in South Wynaad has its church, club, hospital, dispensary, kutcherry, and other Government buildings. It can also boast of a race course and cricket ground. Madras can be reached within 36 hours. Ootacamund in less time, and the Coast by Pony Jutka in from six to eight hours."

Leaf-disease in Africa. Coffee leaf-disease has found its way to Africa. The *British Central Africa Times* says:—Some of the Liberian coffee trees at Mbweni bear the unmistakable stamp of the well known coffee leaf disease (*Hemeleia vastatrix*). The disease is a fungus which first attacks the under side of the leaves causing spots or blotches at first yellow but subsequently turning black. These blotches are, on examination, found to be covered with a pale orange coloured dust or powder which easily rubs off. The blotches gradually increase in size till at last they have spread over the leaves which then drop off, leaving the trees in a short time quite bare, in which state they are of course unable to produce crop or bring that which may have already been produced to maturity. Its ravages in Ceylon in the eighties converted hundreds of acres of beautiful Arabian coffee into withered sticks, as if a fire had raged through the fields. The whole of the Eastern world was more or less affected from Ceylon, but as far as we know this is the first actual appearance of the disease in Zanzibar The Liberian variety is not supposed to be subject to its attacks and this makes its appearance at Mbweni all the more interesting. Otherwise the trees there show a most robust and healthy growth in spite of dry weather.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50 lbs. Nitrogen.
57·38 „ Potash.
14·92 „ Lime.
13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

GENERAL ARTICLES.

TEA COMPANY.

The Balijan Tea Company, Limited.—At a meeting of the directors of this Company, held on the 7th ultimo., it was resolved to declare an ad interim dividend at the rate of 3 per cent. upon the paid-up capital of the Company for the time being. The tea crop for this season, up to November 12, amounted to 318,705lb, as compared with 293,721lb. to the corresponding date last year. The sales up to date of 231,430lb. have averaged 9⅞d. per lb., as compared with sales in Calcutta to the end of November last year of 205,167lb, at 10 annas 9 pies per lb., equivalent to 1s 0¼d. per lb in England.

HEAVY TEA CROPS IN CEYLON.

Despite an abnormally short rainfall in 1898, certain Tea estates gave splendid yields, and some of the figures relating to these will probably interest our readers. Giving the figures for Mariawatte estate, the *Observer* remarks:—

Although the crop for the whole estate has been short, it will be observed that for the now celebrated "101-acre field," the return of made tea was actually heavier per acre than in 1897, the average being as high as 1,073 lb.! The statistics for this field are now complete for fifteen years, and we suppose nothing in the history of tea cultivation in India can approach the high average yield for that period which amounts to 1,133 lb. of made tea per acre. The return is as follows:—

MARIAWATTE ESTATE, GAMPOLA.

As regards the Warakamure estate, Matale, the Manager, Mr. H. Storey—who only returned to Ceylon at the end of December, after nine months' absence—writes to the *Observer*:—

"In reply to your letter of 31st ultimo, *re* above estate's yield for 1898. I am sorry to say that it only turns out to be 720 lb. per acre. The unprecedented series of droughts during 1898 simply played havoc with Matale lower valley crops. If you will note my former reports, you will see that my crop depended for big results entirely on rainfall—the higher the rainfall the higher the yield. 1896 and 1897 were at least 20 inches each year above our average rainfall, and the result was for each year, respectively, 993 lb. and 1,066 lb. per acre, without manure. During the latter part of last year, I manured some 60 acres, and am still manuring, as the tea has been rather weakened by the great drought. At present the tea looks first-rate as the manured portions are beginning to show up, and I intend to keep on with it now in case of future droughts I only returned to Ceylon last week, after nine months' absence, and my 'locum tenens.' Mr. E. C. Anderson had the 'pleasure' of grappling with the drought and its results, which he did successfully."

COFFEE PLANTING IN BRAZIL.

Some months ago an interesting monograph on coffee planting in Brazil was published by J. H. de Bussy, of Amsterdam, Holland. Its author is Dr. F. W. Dafert, of the Agricultural Institute at Campinas, S Paulo, whose competence for such a discussion is universally conceded here in Brazil. The monograph is in Dutch, and we therefore make use of the following translation and digest prepared for the *American Grocer* by J F. Geisler, Ph. C., of New York.

The total amount of land under cultivation for coffee in 1895-96 was estimated at 2,245,557 hectares, and the world's product at 836,000 tons, of which Brazil produced 460,000 tons upon a cultivated area of 1,000,000 hectares. Although Brazil embraces about 8·3 million square kilometres (an area equivalent to that of Europe) and only about one-tenth of this is excluded from the possibility of coffee culture, yet economical reasons exclude nine-tenths of the theoretically available area. Of the latter, much is of poor quality, but can be made very productive through artificial fertilization, which would bring into active factors the *campos* (grass lands) and *terra exhausta* (exhausted soils).

The lands originally selected for coffee plantations were almost exclusively such whose *flora* consisted of primitive forests or wood lands. Rarely were the *campos* ventured upon. While nature of soil, amount of moisture, and climate are the prime factors in the selection for plantations, the lands should not be exposed to frosts or the cold south winds. The soil should not be wet, and must be porous and deep, to prevent injury to the tap root.

Geologically, the best coffee lands are those of recent v lcanic origin, as evidenced by the diorite, melaphyre, and porphyr rocks. To this group belongs the *terra roxa*, a dark red soil. The *terra vermelha*, a lighter red soil, inferior to the former, originated from the paleozoic and triassic ages. One of the best S Paulo soils, known as *massape preta*, is a rich humus soil. The best soils are rich in phosphoric acid and potash, containing usually 18 to 35 per cent. of the former and 10 to 26 per cent. of the latter. The fertility of the soil is usually indicated by the number, strength, and character of the trees.

The varieties of climate in Brazil are so great within the cultivated zone that Rio coffee is usually marketed a months sooner than Santo's coffee, while the crops of Braganca and Atibaia do not mature before October.

Of the varieties of coffee, the *café nacional* is the most widely cultivated. It is less productive than the *café Bourbon*. The latter exhausts the soil very quickly, and is, therefore, not very popular with planters. *Maragogipe* is a large berry of limited production and high market value *Botucatu*, a local yellow variety, known in India as Golden Drop coffee, is not much cultivated. The variety stands between *café nacional* and *café Bourbon* in productiveness. A very scarce variety of scientific interest in the *café hybrico*, with four to six berries instead of the two berries common to the other varieties.

At present the varieties cultivated are divided approximately at 75 per cent. Arabian, 20 per cent. Bourbon, and the rest between *café Botucatu* and *Maragogipe*.

The abolition of slavery in 1888 raised the cost of production of coffee and, in a measure, also the method of cultivation By the old method, as soon as a land showed a tendency toward shot crops the planter with his slaves moved to the interior, where he had acquired new lands. The primitive forest was cut down and the land planted with young trees from the old plantation, or seedling was resorted to. It required three and a half to four years before the new plantation became productive. By the new method a well-manured seed-bed is prepared and the young plants carefully nursed and transplanted two or three times, and gradually accustomed to the sun. The small trees are then transplanted in baskets in rows, carefully spaced, so as to permit the use of machines for hoeing. The careful nursing of the plants yields in one and a half years what the old method scarcely produced in four years. The land is kept free from weeds, and for this purpose is machine hoed at least five times.

To restore the amount of mineral matter annually removed by the crops the added fertilizer should contain about eight grammes phosporic acid, thirty-five grammes potash, and sixteen grames nirogen per tree. Stable manure must also be applied to the soil to get the best results.

For practical purposes the farm or plantation should be divided into two sections one for coffee cultivation proper and the other for food and fodder The ratio for practical purposes should be at least, for 10,000 trees, fifteen hectares fodder land and five hectares animal land. The manure from the latter plays an important part in the successful working of the plantation.

In gathering the crops the ground under the trees is carefully cleaned and the berries allowed to fall on the same. Double picking, to separate the ripe and unripe berries, is frequently resorted to, but is not a universal practice. The picked berries were formerly dried in the sun on mats, the operation taking several weeks. The dried berries were than shelled, cleaned, sorted, and marketed. The average yield per tree was 300 to 900 grammes, the hectare containing 900 to 1,100 trees. The maximum yield ranged between the tenth to fourteenth years, and varied from 270 to 990 kilos per hectare In the modern plantation the trees are planted in line four to six metres apart, and the soil fertilized with a mixture of stable manure and chemical fertilizers.

The preparation for the market of the picked berries is done by both the wet and dry process. Usually the picked berries are put through a decorticator, in which the ripe berries are crushed, while the unripe hard berries pass through unchanged. The latter are dried separately Since the ripe berries float and the unripe berries are heavier, this method is frequently resorted to for their separation. The berries are spread out in layers for drying, the decorticated berry requiring about five days (if dried in shell, eight days), while the green berry requires twenty to thirty days, according to the weather.

The drying process is now much improved by sorting the berries according to their size The berries are first dried in the

NOTHING EQUAL TO THESE IN THE CARNATIC.

[2-10-98—t f.o.]

sun for a few days, by which operation they lose about 50 per cent. of the moisture. They are then transferred to drying chambers, and the drying rapidly terminated; so that the whole operation is finished within five days, whereas the old method required twenty to thirty days. Moreover, the degree of moisture of the berry is more accurately judged during the artificial drying. Thus the blue berries contain more moisture than the green, and the latter more than the yellow.

The modern method of applying fertilizers tends to an increased production of coffee. Thus the products from fifty trees raised in the trial gardens averaged per tree as follows:—

	Planted					
	1892. gram.	1893. gram.	1894. gram.	1895. gram.	1896. gram.	1897. gram.
Unfertilised	25	35	200	90	605	560
Fertilised	40	120	780	480	700	900

For well-fertilized trees twenty years old the products should average 2·5 kilos per tree. Relative to the future of coffee culture in Brazil, there is nothing in the natural conditions to prevent either the continuation or expansion of raising coffee. The principal difficulties are in the management.

The present position of the planter is very precarious, and most of them may be compelled to sell or surrender their properties to the mortgagees. In that event the new possessors could work the plantations to advantage at the present prices A great many Italians have been imported and have displaced slave labour on the plantations. There is no likelihood of these Italians emigrating, as no other land offers any better advantages for obtaining subsistence and which condition invites further immigration. —*Rio News*, Nov. 29.

STRAY NOTES ON MANURING.

DEEP MANURING.—Our wheat, oats, rye and other grains were but wild grasses which have been bred up to their present condition by the careful labors of the intelligent cultivator. So in the application of manure we must improve upon nature's plan, for our object should be to make our soil as rich as possible with the means at our command.

We see by watching some of nature's works that the richest lands are those deep and well filled with decaying vegetable matter, as for example, the reclaimed swamp, which is one mass of decayed vegetation. These, when drained of their surplus water and allowed to absorb air and sunshine, become the most productive because they are full of vegetable matter or humus. So in applying manures we should aim to fill the ground to as great a depth as possible with vegetable matter. This applies not only to stable manures, but to green crops which we should grow and plough under, for by so doing we fill the soil with the much needed humus. This makes the land light loamy, capable of absorbing much more rain and withstanding greater drought.

Another objection to mixing manures in the surface layers is that the tendency of the valuable parts of the manure is always downward, that every rain carries it down and it soon gets below the reach of plant roots. This is the most foolish kind of nonsense, for nearly all cultivated crops send their roots down to a depth of from two to four feet, even in a stiff clay. The idea that all water in the soil is going downward is wrong, for nearly always as much and often even more water rises through the soil by capillary attraction than soaks down from above.—*American Agriculturist.*

* * * *

PRESERVING MANURE UNDER COVER.—A building for farm animals must be provided. It must be warm so that nothing will freeze inside, yet well ventilated. as good pure air is essential. It should be large enough to accommodate all of the stock kept. Different apartments or pens may be used while feeding the root or grain ration, after which the animals may be provided with a large inside yard of sufficient size to allow them free and constant exercise at will. Coarse food should be first prepared by being put through the cutting machine. It is then in fine condition for feeding All the waste is then available as an absorbent. This inclosed space may also be kept bedded down with any waste refuse, leaves, dust and a moderate amount of lime and land plaster. Enough fine bedding should be used to keep it dry and clean at all

THE INDIA TRADING COMPANY, Limited,

AGENTS FOR **MADRAS,**

Messrs. HIERON ROLFE & Co., LONDON.

ORDERS BOOKED FOR

BEGG'S PATENT TEA ROLLING MACHINE £95.

PACKING AND SHIPPING £3-10.

THIS machine has been in use for some years past on private estates in Assam, and the excellence of the tea manufactured thereby is proved by the good prices obtained, and the reports characterise the teas as being "good *tippy* teas, with strong pungent liquor, and well-twisted leaf."

The roller adapts itself to any class of leaf, and can be used, if desired, as an open top machine, or pressure can be applied as lightly or heavily as necessity may arise by means of a simple mechanical arrangement. The twist in the leaf is obtained to a degree of nicety without balling, no breakage occurs, and is kept cool throughout. The tips are not blackened by the oxidation of the juice from the leaf.

The low price of the machine will allow planters to obtain an excellent leaf roller at a very moderate figure, and thus be enabled to supplement their rolling plant, which in so many cases is insufficient.

The machine is very easily driven, absorbing about 1½ h.p. only when fully charged. The mechanism is exceedingly simple, and nothing can get out of order. All parts are made of the best material, and good workmanship guaranteed It will take 300 lbs. of withered leaf at a time, and is easily and rapidly filled and emptied.

TILESTONITE.

A new covering for corrugated iron roofs and walls.

Invaluable as a Heat-, Fire-, and Water-proof covering for Withering-Houses, Fermenting Rooms, Offices, &c.

Makes a clean, fireproof floor for an upper sorting or withering department.

Further Particulars on application to the India Trading Co., Ld., Madras.

times and to absorb all the liquids produced. The different apartments that may be in use should be cleaned daily and the contents added to that in the large space All will be re-mixed by the stock.

A compost thus prepared retains all of its value. No possibility of waste exists, as there is no exposure to rains to wash away its richness nor loss from evaporation or heating Being made up of all kinds of animal and vegetable matter it is the best and cheapest compost known, and always in a condition to be handled. The building is presumed to be large enough to permit the entrance of a team and wagon at any time for hauling out the manure. I anyone doubts the practicability of this method, come to my farm at any time and I will convince him of its usefulness. *O. S. Sisson. Wisconsin.*

* * * *

SUBSOILING NOT PROFITABLE. - Recent tests at the Georgia experiment station indicate that subsoiling produces no appreciable effect upon the crops.

* * * *

GARDEN REFUSE.—When I called in upon a Surey gardener recently, where there is an extensive garden that has to be manured without animal matter, the house being empty and no horses kept, I asked "how he managed to get such wonderfully fine crops of all things," and he said, "I will show you our manure heap" This I found outside of the garden, under a north wall and overhanging trees, and the accumulation of everything obtainable of vegetable nature was a huge one. No animal manure, no artificial manure, a deep sandy soil, and only natural manure such as decayed vegetable matter, yet splendid results. But then, how many gardeners are there who have to be dependent upon similar materials as manure? Chemical analysis on scientific basis would show this material deficient in phosphates and potash; root analysis shows that it is capable of remarkable results A.D. In *Journal of Horticulture and Cottage Gardener*, Dec. 8.

* * * *

MODERN IDEAS CONCERNING LIME.—Mr. D. P. Fornay, Adams Co. Pa., writes:—For many years lime was the standard fertilizer for this county. We are discarding many of our old lime ideas and there is nothing so difficult as the getting rid of prejudices. Let us look a little at some of the inconsistencies usually held as to the action of lime. A pig dies. We drag him to the compost heap, spread lime on him to "eat him up" for a fertilizer, and straightway go home and whitewash our hams to preserve them. We say "lime is not a manure but a solvent of organic matter," but when we tear down the old board fence we find that part of it not reached by lime, most effectually dissolved by the unaided action of nature's forces.

In fact, the outside shell of the board saturated with lime is the part best preserved. Here the forces of nature are evidently a more powerful solvent than lime. So we plunge our eggs in the strongest possible solution of lime, following nature, which puts a shell of lime around them to preserve them, and it does it.

Still farther, the opinion is almost universal among old Adams county farmers that lime as a fertilizer, "will not tell the first year." I have often seen its effects plain and decided five or more years after application. But if its effects are due to its ability to "act on vegetable or organic matter," ought it not be most effective when first applied in the caustic state, as it is usually called, and when it would therefore "act" most powerfully on vegetable matter and not after it has laid in the soil for a year or more and has passed into the inert carbonate or hydrate?

With these facts in mind we ought to abandon the old notions about lime and adopt the view that it is a manure, like any other plant food, and is prepared, as they are, for plant nutrition Instead of "acting upon vegetable matter" in the soil, it is acted upon by the vegetable and other acids created in the soil by the decomposition of organic matter, after it has lost its power of neutralizing their action to a great extent, and is then absorbed or assimilated by the plant, as other soil ingredients are. Hence plants with most lime in them are most benefited by it. One-third of the ash of clover is lime, and it is the best fertilizer for clover.

Why, then, are Adams county farmers turning from fresh-burned lime, as they plainly are, to the phosphate of lime? This change is going on all over south eastern Pennsylvania: First, because the latter comes already dissolved by a powerful acid for use by the plant, and second, because it contains both phosphoric acid and lime, which will make a better wheat crop than lime alone. Then there will be enough soluble lime left, after an ordinary application, to make good clover. All this is every succeeding year being more clearly demonstrated by practical experiment. This shows us the foolish wastefulness of the old plan of applying from 50 to 100 bushels of lime per acre at one application, and teaches how dearly we pay for wisdom when it must come to us through the wearisome school of experience.

HOW TO INCREASE THE SALE AND PROFITS OF INDIAN TEA.

The *Indian Sportsman* says:—There has been some discussion of late in the columns of our contemporaries on the subject of extending the sale of Indian Teas at home, and of securing for proprietors a larger share of profit than they now receive. Of course any suggestions likely to conduce to these so desirable results are welcome, if based on practical grounds; still, no advantage can result, but rather the reverse, from an imperfect understanding and argument of the matter. Thus we see some of the correspondents run amuck of the middleman and the retailer, as if these men were natural enemies, to be put down in the most summary manner; but those who argue thus forget to what an extent proprietors are really dependent on them Take away, for instance, the middleman, (although there may be several such) whom we we will call the capitalist between the seller and the retailer, and from where would come the biddings for exceptionally large stocks, when sales to meet drafts have to be made at any sacrifice. These men are *always* buyers, if they see their way to make a profit; but at times they are the *only* buyers who can absorb the large quantities offering. They buy to hold till they can sell to advantage, and so they, in fact, keep up the price of tea, for if they were compelled at all frequently to flood the retail market at low prices, the force of competition would compel the grocer to charge the public, also, exceptionally low prices, and there would thus be created a reaction to the detriment of prices at future auction sales.

Then, again, as to the retailer; he, sometimes to a small extent, sometimes to a larger extent, is also often a capitalist and where he does not buy at auction direct, he assists the middleman by relieving him of stocks when the former finds himself pressed. Obtaining his supplies, thus, at a lower rate than usual, it pays him to hold to a larger extent than the ordinary nature of his business would justify; but meanwhile his money is locked up, and he naturally expects to get a return on this account. If the retailer be a man of no capital,—purchasing only from hand to mouth,—he has to pay the price demanded by the wholesale dealer, and in consequence he has to charge accordingly; and as to competing with the retailer, you can only do so on unequal ground, for while his livelihood is derived from many items of his business, yours, if you established, as has been recommended, retail Tea agencies, would accrue from one item only, and you might find your expenses would be too great. We do not say that under peculiarly favorable circumstances, where a man could be his own agent, and thus protect himself from dishonesty or extravagance of working, as well as bring to bear the requisite energy in pushing his Business, retailing might not sometimes pay; but when the argument assumes the form of a recommendation to Tea Companies or the Tea Association at home to start shops all over the country, we feel it necessary to point out the absurdity and impracticability of such a project, and to point out also how much more desirable it is to take advantage of the already existing Agencies, and bring them over to your side.

Therefore, when people, in the desire to see an improvement of the prices received by proprietors, rush into the idea that this is to be effected by sweeping away, or even attempting to compete after it is sold with, those into whose hands tea passes at they set before themselves a task in which they are bound utterly to fail. So long as tea is grown to so large an extent as it is, and will continue to be, on borrowed money, so long must the aid of the monied man at home be a necessity, who must charge the public such a price as will leave him a sufficient profit. The intense competition which prevails, prevents the retailer from charging an excessive rate, and therefore it will be seen that, considering the number of hands through which, often, Tea passes before it reaches the consumer, the prices paid by the latter cannot, as a rule, be considered high,

PRICE LIST OF MANURES.

Including Cost, Freight, and Insurance (f.p.a.) per ton, packed in double bags.

Prices firm to 9th February 1899. (Subject to such contingencies as war, fire, strikes and the like.)	Minimum Lots.	To Madras.			To Mangalore, Calicut, or Tellicherry.			To Tuticorin.

F.r.m.

nor the profits of the middleman or middlemen, the wholesale dealer, and the grocer, be deemed excessive either.

Another proposal, equally absurd as the one just commented on, has recently been made by a writer signing himself MATT DREWS. His idea is, that direct agencies be opened by the London Tea Association in all the large towns of the United Kingdom, and that a system of "weekly auctions" be held, *in different parts of each* town, of packets of Tea weighing from 2 ounces to 5 lbs. He promises tea proprietors that the prices realized by sale, thus, to the highest bidder, will equal those obtained now by the large retailers, and that soon the demand would exceed the supply. (He does not mention the *cost* of these auctions.) We are to picture to ourselves, then, the public flocking to these several miniature Mincing Lanes of each town, and, over some hours, bidding eagerly—down even to a 2 oz. packet—for this article of domestic consumption: the lady, the middle-class housekeeper, and the poorest mechanic's wife, all combining to forsake "the grocer round the corner," and to support by their presence and their patronage "weekly auctions of packets of tea from 2 oz. to 5 lbs. or so, to be held in different parts of the town."

It is contended that if firms like Dakin & Co., Ridgway & Co., Cooper & Cooper, can and do make large fortunes, so can the Indian tea owners; but it is forgotten that whereas the firms named have made the Tea Trade a speciality, have invested probably large capital in it, and spend yearly enormous sums in advertising, each concern looking after or organizing its own business with all that energy and talent which is found among our large business men in England, the disunited Indian companies and proprietors of Indian tea could never hope to maintain even-running; apart from which they are not in a position to be able to keep their produce away from Mincing Lane, and they are not rich enough to embark in a new speculation.

The only thing, it seems to us, that *could* be judiciously done would be for each Indian Tea Co., or proprietor, to subscribe to a fund, as was done with the Tea Syndicate here, to be placed in the hands of the home Tea Association. That body should cause to be forwarded to, say, a leading grocer in each town a sufficient quantity of small samples of pure Indian tea for gratuitous distribution to the retailer's constituents and others. The grocer should also engage to keep on his counter Indian Tea (supplied to him gratis) "on brew" for a time. The merits of our pure teas would then soon become known amongst the citizens; the grocer selected would be stated as the only man in the town from whom *of a surety* pure Indian tea could be obtained. [He would take very good care to make *this* known] and he would find his advantage in a monopoly, thus, of the trade in that particular place, while competition would prevent his *over*-charging the public. Of course a *sine qua non* would be an agreement on the selected grocer's part, to sell nothing but pure Indian tea. This kind of guarantee is freely given and honestly acted upon in respect to numberless specialities in food, and tradesmen are found only too glad to sell none other than a "particular brand;" finding their profit in being recognized as the only safe persons to whom to apply for "the genuine article." The trouble required to be taken and the expense to be incurred, by the home Tea Association would be—

1. The selection and packing of some one or two hundred thousand 1 oz. packets of tea, taking care to avoid the too pungent qualities; and confining the selection for any one town to one class of tea,—a bulked quality—the nature and preparation of which mixture would be explained to the grocer, to regulate his purchases in the future.

2. The drawing up, and printing, in sufficiently large numbers, circulars detailing the merits of Indian tea.

3. The selection and appointment of a leading tradesman in each town to engage to push the sale of pure Indian tea (to the entire exclusion of China).

4. The free grant to such tradesman of a sufficient quantity of samples of tea and of tea circulars for distribution in his town.

The entertainment for some few months of a commercial traveller to carry out the objects mentioned in paras. 3 and 4.

The burthen of our argument comes to this: Indian tea proprietors cannot themselves undertake to establish their own shops for the retail sale of Tea; nor can the Tea Districts' Association do so, but they can and ought to avail themselves of existing agencies; and they can and ought to outlay money liberally (as every business man or firm has to do now-a-days) in making the excellence of their produce widely known throughout the land, even at the risk of a possible preliminary loss. The taste for our pure growths thus to a very large extent established, increased demand would arise sufficient to tangibly and permanently enhance prices at Mincing Lane. From this enhancement a speedy advantage might be expected to result in favour of all tea proprietors, greatly in excess of the sum they might have subscribed towards producing this result.

Of course it will be understood that the grocer is not to look to the Tea Association for his sale supplies of Indian tea. He will have to arrange to supply himself through recognized channels; and the only thing the Association need do is to induce him, by a liberal supply of samples and circulars, to try and secure for himself a large supply of tea drinkers as customers, who will forsake, in time, Chinas altogether for the pure article. For the Association to become (as has elsewhere been suggested) itself a retailer would not answer, and indeed could not be at all carried out;—we doubt if even a Limited Company would succeed; but there is every reason why all proprietors should subscribe rateably towards a fund, to be managed by the Association, for the diffusion of the knowledge of Indian tea amongst our brethren at home. Private individuals have been and are making effort and spending money to this end; but they can, with all their desire, effect so very very little. It needs a special organization and a considerable expenditure of money to do what is necessary; but there should be no difficulty in raising a subscription fund, from those interested in Indian tea, of at least £5,000. This would be ample to carry out the plan we recommend, and the return to proprietors, in the future greatly increased demand and price of Indian tea, all round, would far more than compensate for the temporary pecuniary sacrifice.

Will the Tea Districts' Associations here and at home take up the idea, and try to carry it out?

PRODUCE AND PLANTING.

The Russian Tea Market.—The Baku correspondent of the *Times* in a communication, in which he discusses the Russianising of the Black Sea trade, makes an interesting reference to the tea trade. He says: "Meanwhile Russia, by the creation of the Volunteer Fleet, rendered it possible to take into her own hands her trade with the Far East. This fleet, the joint product of national patriotism and of Government aid, was designed to fulfil the double purpose of commerce and defence, to serve as a mercantile marine during peace, and as a subsidiary naval force in event of war. It received an annual subvention of £81,600 from the State, and by low freights quickly increased the exports from Odessa to Vladivostok five-fold, from 6,567 tons in 1890 to 32,225 tons in 1894. During later years it has undergone a development of much interest to the British tea industry in India and Ceylon. From the first it brought back considerable quantities of tea, and it determined to increase this branch of its business by calling at Colombo. The Ceylon planters promptly took advantage of the cheap transit thus afforded, and a considerable quantity of their tea is now finding its way into South Russia, and even across the Caucasus and Caspian into Central Asia. The efforts of Russia to destroy the Indian land trade with its Asiatic territories told in favor of the sea route. Under the regulations by which the Khanate of Bokhara was included in the Russian customs' zone, the duty on tea imported from India through Persia and Afghanistan was raised, while the same article, if landed at the Russian port of Batum on the Black Sea, was passed on in transit without paying duty, and was charged by the Bokhara customs house at less than one-third of the duty levied on teas entered for consumption at Batum. Such transit tea is of an inferior green quality, and it remains to be seen whether the Indian tea exporters can recover by the Russian Volunteer Fleet, viâ Ceylon, the land trade which they have lost through Persia and Afghanistan. In 1895 the so-called 'Indian' tea that passed through Batum to the Caspian and Central Asia amounted to 800 tons; the last Consular report returns it at 1,330 tons in 1897. The trade in this low-class green tea is independent of the large question of the introduction of the finer Indian teas into Russia itself. A movement in that direction is taking place, and the Russian shipments of British-grown tea from Ceylon rapidly rose to 439,350lb in 1897, besides over one and a half million pounds of Indian and Ceylon teas from London, and an unknown quantity transmitted through German ports. Hitherto the Ceylon and Indian teas have only been used in Russia for blending. If they

could be brought into general use a vast new field would be opened to the British industry. But this would involve either a change in the Russian taste or an adaptation of the Indian teas to the Russian market. The movement may, however, receive an impulse from the expected steps towards the equalisation of the Russian duty on sea-borne and land-borne teas, as part of the revised customs arrangements incident to the extension of the Siberian railway towards China."

Indian Tea in Tibet.—Mr. Robert Laidlaw calls attention in the *Times* to the revised treaty between India and Tibet, which is subject to revision in May next, and upon which the Indian Tea Association is no doubt keeping an eye. Under this treaty Indian tea is absolutely prohibited from entering Tibet. To the very large class who are directly or indirectly interested in one of India's chief industries, one in which many millions of British capital are employed, it is very important, as Mr. Laidlaw points out, that this restriction should be removed. The Tibetans are great tea drinkers, probably the greatest in the world, their estimated consumption being from 12 to 15 million lb per annum; all of this is now taken from China, whereas, but for the "closed door," this trade would naturally be done with India, which produces a better article at a lower price. The Tibetans have now to pay a high price for a very inferior brick tea, and, as the distance between the tea districts of India and Tibet is much shorter than that over which the China tea is carried, transport would be cheaper; the change would therefore be beneficial alike to the Tibetans and the Indian Industry. "The Tibetans have free access into India and no restrictions are put upon their exports into that country," says Mr. Laidlaw. "Chinese influence alone is responsible for our not having the same privileges, and it was Chinese influence which prevented the friendly commercial mission which the Indian Government proposed and prepared to send to Lhasa in 1889. The present position is a most humiliating one. Surely the influence of Pecking cannot longer be allowed to retard British enterprise and shut our trade out of a country where the Chinese have no more right than ourselves. If our engineers were allowed to go into Tibet to unearth their minerals it would be an immense advantage to the Tibetans themselves, some gain to us, and no detriment to China, but for that I fear the time is not yet. When revising the treaty the Government should be satisfied with nothing short of equal privileges to those enjoyed by China in the east and Russia in the north. Give us an 'open door,' and in a few years Tibet will be a large and increasing market not only for Indian tea, but for many articles of British manufacture."

Nice Tea.—The competition in the retailing of tea has brought about some interesting ventures in the art of tickling the consumer. Here is a list of presents advertised by a retail tea company: Given with quarter-pound of tea, at 7d per quarter: Large tin saucepan (with steamer), pair of lace antimacassars, two large honeycomb towels, hairbrush (all bristle), good washleather, fancy china cream jug, strong wood horse, cocoa broom (red back), strong bass broom, six-pint tin kettle, good clothes or shoe brush. Given with half-pound of tea, at 7d per quarter: 8ft 6in bamboo cornice pole (rings and ends complete), large oval bath, white table cloth, clothes basket (good size). Given with one pound of tea, at 7d per quarter: Nickel lever clock, wool-bordered parlour door mat, white table cloth (large size), one yard best floor oil-cloth (two yards wide), blanket (good size). With two pounds of tea: Large oil stove. With three pounds of tea: Eight-pint copper kettle. With four pounds of tea: Pair blankets (full size). Customers may save their tea checks for any article they see in shop or window, and change them at any time.

Planting in New Guinea.—Possibly there may be an exodus of Indian and Ceylon planters to New Guinea. Sir William Macgregor says that the colony is well adapted for tea, coffee, tobacco, and cotton, and the climate is not bad, land is cheap, and there are

ROYAL EMPORIUM,

BANGALORE.

GENTLEMEN'S DEPARTMENTS.

Tailoring. Under the control of a European Cutter. A splendid range of Patterns in Tweeds and Flannels. Samples on application. Prices extremely moderate.

Outfitting. A complete stock of Collars (all the latest shapes), Ties, (a handsome selection) Hats, Caps, Evening gloves, &c., &c., &c.

w, 1.10-98—t.f.o.]

friendly natives who may be induced to work. The fear of being eaten need not trouble settlers, for cannibalism is nearly a thing of the past.

Queensland Coffee.—Not content with her triumphs in the way of sugar production, Queensland agriculturalists recently turned their attention to coffee, as there are considerable areas of tropical coast lands suitable for the cultivation of the coffee plant. A quantity of unhusked coffee berries has just arrived from the colony for introduction in Mincing Lane. Half-a-dozen leading firms of brokers have reported upon this Queensland coffee, which they state to be well cured and dried, and to compare well with the Central American article in general quality.

What They Are Doing at Kew.—The organisation at Kew Gardens with regard to the culture of tropical plants is admirable. Special departments have been founded in the more important colonies, which keep continually in touch with the establishment at Kew on botanical questions, and especially those of economic importance, and there are, in addition to these larger Colonial establishments, a considerable number of botanical stations, first founded to meet the special requirements of the smaller West Indian Islands, and since extended to West Africa, and even to Fiji. In many of our colonies the fruit trade of late years has become of great importance, and to this Kew has paid special attention. With its aid the tree tomato, the chocho, and the cherimoyar have been transferred from the West Indies to Ceylon and India, and the debt has been repaid by sending back new varieties of bananas and mangoes. There are also many plants which are valued not for their floral beauty, but for their utility. The fibre plants, as one group about seventy in number is collectively called, of which hemp and flax are the oldest and most familiar examples, have now been carefully studied at Kew for not a few years past. China grass forms the subject of a recent article in the *Bulletin*, from which it appears that, if certain difficulties could be overcome in preparing the fibre, it would be a formidable competitor in the market with silk, flax, and the better qualities of cotton. The cultivation of rubber plants and the discovery of new sources of this material, now that the demand for it is so great, is a question which evidently has not been neglected at Kew, and some of our colonies seem likely to benefit by its studies. Besides these, a host of other horticultural questions of economic importance have been investigated—such as Bermuda arrowroot, quinine, vanila, the growth of dates, sandal wood, incense trees, even the artificial production of indigo. In all this work the indefatigable labour of the late director, Sir Joseph Hooker, and of his successor. Mr. Thiselton Dyer, seconded by the very able scientific staff of the Gardens cannot be too fully recognised.—*H. & C. Mail.*

MARKET REPORT.

The following advices are from London by the mail of the 30th ultimo. The "turn of the year" naturally caused an interruption in business, hence the meagreness of the information that is forthcoming in our present issue.

COFFEE.

The public market will remain closed until the 5th proximo. Privately there is little to mention, says the *London Commercial Record*. Futures of Brazil opened quiet, unchanged, and became easier—March selling at 31s. 1½d. and May at 31s. 7½d—but soon firmed up, and close only about 3d. below last Friday's quotations, March selling yesterday at 31s. 6d., May at 32s. 3d., and July at 32s. 6d. Closing rates are as follows:—

London	Santos.....	March delivery	31s. 6d.
New York...	No. 7 Rio	,, ,, ...	5·75 cents.
Havre	Santos.....	,, ,, ...	38¾ francs
Holland ...	Good ordinary Java.....		32½ cents.

Imports Deliveries and Stock of COFFEE in London are as follows:—

Ditto United States...	819,000	621,000	789,000
Stocks.....	662,000	953,000	610,000

Havre, Dec. 29—Market Steady. Santos good average, March opened at 38½f. and closed at 38¾f., May opened at 39f. and closed at 39¼f.

New York, Dec. 28.—Closing prices of No. 7 Rio were as follow:—

	Dec.	Jan.	Feb.	Mar.	April.
Dec. 28.....	5.55	5.50	5.65	5 75	5 80
Dec. 27	5.55	5.50	5.60	5.75	5.75

IN AMERICA.

The American Grocer of 12th ult. says:—There has been very heavy buying since our last by big houses. Can it be that this is in anticipation of a duty being placed on coffee? It certainly looks that way, in view of the openly "bearish" talk of the principal buyers.

The market is higher for Brazil. Fine roasting mild coffees scarce, and command figures considerably above quotations. A line of Cucuta that would grade Good in an ordinary market was sold at 10¼c to a jobber, although Good is quoted at 8¾c; but coffee that grades there to-day would not be so regarded were the average quality of the Maracaibo crop better than it is.

TEA.

IN LONDON.

No auctions have been held, and buyers await the revival of public business in the new year.

IN AUSTRALIA.

Teas are firm, and the recent large sales for export have helped to strengthen the position. Holders of Foo Chow sorts anticipate an advance. —*Leader*, December 24.

IN CEYLON.

The following is an extract from Messrs. Somerville & Co.'s annual report:—We give below the Chamber of Commerce figures for the exports of Tea for the year ending 31st December 1898. The total export for 1898 was 119,769,071 lb., an increase of about four million lb. over 1897 but notwithstanding this increase the exports to the United Kingdom were about three million lb. less than in 1897, owing to the increase of direct exports to other countries, notably Australia two millions more, America one-and-a-half millions, and Russia one-and-a-quarter million lb. The direct exports to other countries seem likely to increase more rapidly in 1899, and must exercise an important influence on the Tea Industry of Ceylon.

The quantity offered for sale in Colombo during 1898 was 36 million lb. an increase of three million lb. over 1897, and there is every prospect of a considerable increase in 1899, owing to the growth of direct exports.

QUANTITY BROUGHT TO AUCTION IN COLOMBO.
From 1st January to 31st December, 1898.

Offered.

1898	...	460,829 packages =	35,907,518 lb.
1897	...	425,582 „ =	33,788,217 „

Sold.

1898	...	348,551 packages =	27,721,866 lb.
1897	...	322,755 „ =	25,630,499 „

The average price for the year 1898 was 35 cents. per lb., against an average price of 37 cents per lb. for the year 1897.

The average price for complete Invoices offered for the year 1898 was 36 cents per lb.

IN AMERICA.

The sale of 10,192 packages of tea by the Montgomery Auction and Commission Company, December 7, showed according to the *American Grocer*, very irregular prices for new crop Formosa while old crop teas were firm at an advance of 1c. No Pingsueys were offered. Congous were very irregular.

Quotations, in bond, are: Good medium, 12½ @ 14c; medium, 11c. Amoys, old crop, good common to fair, 19 @ 19½c. A line of 507 half-chests new crop Foochow, grading superior to fine, averaged 12.95c in bond.

The quotations established for Japan were as follows: Pan-fired, new crop, in bond, finest (early crop), 18c; fine, 16½c. Basket-fired, new crop, duty paid, finest 27 @ 28c. Sun-dried, new crop, in bond, finest, 17c; fully fine, 16c.

The country greens brought full prices: New crop double half-chest rather good small extra Gunpowder, 18c; do, first extra Gunpowder, 16c; bold first Gunpowder, 15½c; half-chest plain small first Imperial, 14½c; double half-chest poor off-extra Young Hyson, 12c; Gunpowder style Hyson, 12½c; average for 86 packages, 14.48c, in bond. Another line—102 packages —sold from 11@15c, or an average of 12.41c, in bond.

Of new crop Formosa, 441 packages good superior averaged 14.55c; 529 packages on superior averaged 14.53c; 521 packages fully good averaged 14.08c; 502 packages fully good averaged 14.05c; 413 packages on superior averaged 14.16c; 566 half-chests good averaged 12.88c; 429 half-chests good averaged 13c. Quotations, in bond, are: Fine, 22c; superior, 16c; fair to good 12½c.

PEPPER.

IN LONDON.

Auctions are suspended and private sales limited.—*Black.*—The market on the spot is fairly active and occasionally in sellers' favour; Singapore has realised 4$\frac{3}{4}$d cash less interest, and 4$\frac{3}{16}$d full prompt, and Tellicherry 4$\frac{11}{16}$d per lb. usual terms. For arrival no alteration can be noted; Singapore Jan.-March (s.) has buyers at 5d per lb. after business at this figure. Closing prices are dearer. Singapore January-March 5$\frac{1}{16}$d bid, February-April 5$\frac{1}{8}$d, and March-May 5$\frac{3}{16}$d. 25 tons Tellicherry sold at 4$\frac{13}{16}$d per lb. c.i.f. delivered weights, per January-February steamer to London.

White very quiet, with prices maintained at their previous level. Singapore January-March (s.) is bid for at 8¼d, and Penang same dispatch can be bought at 7¾d per lb.

CENTRAL AFRICAN PLANTER.

A Monthly Record of the Planting Enterprise of British Central Africa.

Edited by **R. S. HYNDE, F.R.G.S.**

Price 1s. 6d. per copy.

ADDRESS:

HYNDE & STARK, Songani.

ZOMBA, BRITISH CENTRAL AFRICA.

THE PRODUCE WORLD.

A WEEKLY ILLUSTRATED JOURNAL.

Solely devoted to the Interests of Planters, Shippers of Produce, and Colonial Storekeepers.

LONDON.

ANNUAL SUBSCRIPTION 10s. 6d.

"THE PLANTER,"

NEW AND ENLARGED SERIES.

This is a WEEKLY JOURNAL conducted with a special view to the interests of Planters. It contains Leading Articles by Experts: After-edits upon Topics of General Interest to Estate Managers and Assistants:

Editorial Echoes,	**Letters to the Editor,**
District Correspondence,	**Tea Market Reports,**
Companies' Reports,	**Home News,**
Commercial Notes,	**Tea Sales, and**
Indigo & Coffee Notes,	**Comparative Tables,**

showing the Position and Returns of Calcutta and London Tea Companies.

"THE PLANTER"

is an excellent medium for Mofussil Advertisements: its circulation is among a special class of buyers.

"The Planter," 9, Hare Street, Calcutta.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 27th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Please note the change of address.

Coorg. Polli Betta, 24*th January*.—*Weather*.—Clear, fine and cold. East wind conspicuous by its absence lately! *Crop*.—Picking still in full swing; but has been stopped in some cases to allow sufficient crop to ripen. Crops has been ripening very well and coming in with a rush; and are turning out very well. *Plant Diseases*.—Rust is not absent; but the trees have been standing the heavy crop very well. Crops ought to be average next season under favourable conditions. Grains are cheap now. Gram at Rs. 3-8-0 to 4-0-0 per *palla*.

South Mysore. Mudigere, 25*th January* 1899.—Since my last, news has been quite as scarce as before. *Weather*.—Continues seasonable, strong East wind, cool nights, days are not hot. Thermometer seems to range between 47° and 78° for the month but the minimum was only reached one night. There has been no rain here fortunately. *Crop*.—Some places have already passed their estimates and have not finished, there seem to be general complaints that the last of crop will not ripen. A few despatches have been made to the Coast but as yet I have heard of no outturns. *Diseases*.—A trifle of leaf disease noticeable here and there, but very little. Howligays seem to have started a little of their blight. *Labour supply* has been almost excessive here this week but some falling off may be expected. There has been a rush of locals for a short interval between paddy cutting and threshing; the latter is now generally commencing, as the nights are light.

SOME WORK FOR SCIENTISTS.

AN Agricultural Chemist is to come to Mysore, an Entomologist to be employed by the Government of India. These be but small contributions towards the necessities of the producing industries of this country, yet the various Governments concerned will have to exercise considerable discretion when allotting these scientific gentlemen their tasks. It would be easy to note down a list of work that would occupy the two scientists for years to come, and, unfortunately it is to be feared that though "full-time" men, one if not both of them, will not be full-time investigators. Perhaps it is but natural that one or both of them should be called upon to undertake a considerable amount of educational work. Certainly, it is right that a band of indigenous scientists—if we may use the term—should be formed, on however small a scale at the outset. Nevertheless, we have used the word "unfortunate" advisedly, for it is decidedly unfortunate that the work of scientific investigation should not be kept entirely and strictly apart from the work of scientific instruction. For one thing, science cannot be imparted in a day. We question if there are more than a very few Indians available who have even a natural leaning towards natural science. The work of tilling the mental soil will be a work of time, and it can scarcely be hoped that the seed will be sown and the crop reaped in any but a very few instances until one expert shall have succeeded another in the work of brain-farming. We do not want to see the country flooded with students of Entomology, unless these young gentlemen are to be apt, intelligent and cautious catechumens of science. It is a fascinating field of research, this Entomology ; but it is beset with traps for the unwary, and the man who falls into these must in many cases be a menace to his fellow-men. The identification of *beneficial* insects, as distinct from pests, is a work of extreme difficulty, and a student who confuses the two may inflict serious harm upon a community if not upon the country. In the first place, at any rate, we trust the Governments of India and Mysore will let their scientists have full scope in the work of investigation, and that education of the college or class order will be a thing with which these gentlemen shall have no concern. Certainly, there is no reason why each man should not have a small band of assistants round him, that they may do detail work under his instructions and acquire a really practical knowledge in return. But the work of the investigator should be distinct from the work of the educationist.

From a planter's point of view investigation should, of course, find a special sphere of operations in tea and coffee estates. The analysis of soils, the comparison of soils and of products of the same species grown on different soils, the investigation of plant life, its diseases, the food required, the action of rain, of manures, of climate, of weather, all need to be considered. "High cultivation" is not a panacea against disease. "Good" cultivation may be, but the difficulty is to ascertain in what this "good cultivation" consists in respect to particular districts or estates or plants. Leaf disease is best tackled by means of improvement in cultivation, but when a boy becomes scrofulous from want of proper food, the physician does not administer *pâté de foie gras* as a remedy! Coffee-planters have in many instances discovered by careful experiment and more or less bitter experience, what sound, healthy cultivation means. Yet how few of them would not find their experience deficient if they were suddenly transferred from, say, the Mysore district, to the charge of an estate on the Nelliampathis. It is individual experience that is at work for the most part, not scientific knowledge, and the former alone is by no means an infallible guide. One duty of the scientist will be to sift the evidence, so to speak, of practical men, and then to lay down broad general principles of cultivation, with notes of modifications required under special or particular circumstances. The examination of soils and seeds and plants is the work of a life-time, even if a man goes no further than through the estate products of Southern India. It will not be enough to give long statements of the analysis of this soil or that. The scientist will have also to discover under what soil conditions a particular plant yields the best practical results to the cultivator. He will have to consider atmospheric and other influences also, and when he has arrived at general conclusions of the soundness of which he is satisfied, it will remain for individual planters to learn how to apply the information thus placed at their disposal.

It is to be feared that the tea industry will receive but little scientific care just yet, for Mysore is not a tea-growing province, and the "India" entomologist alone will be free to make occasional investigations in the Tea districts. Happily, we hear but little of tea-diseases, and perhaps, the want of a scientist will not be seriously felt by tea-planters just yet. Nevertheless, in no direction is there more need for scientific investigation than in that of the cultivation and manufacture of tea. The Mysore scientist is not likely to have leisure for work of this kind, and indeed it would be a pity to try to extend the scope of his operations too far. The entomologist may render some assistance in the identification of pests, &c., but generally speaking tea-planting must go on with such casual scientific aid as it has hitherto obtained, supplemented by that of special chemists employed by merchants or others. Similarly, the great producing industries of Southern India, in regard to paddy, sugar, oil seeds, indigo, &c., &c., must continue in effect virgin of the scientist. Here alone is work that would occupy a lifetime, even though it might only end in demonstrating how the applied experience of many centuries had arrived as near the truth as the scientific investigation of as many years. The subject we have selected is one that can only be treated generally in the space of a single article. The mere enumeration of details requiring attention would occupy many pages, and would confuse the reader. Indeed, each fresh item put down would reveal the necessity for further entries, so that the list might grow and grow, yet would certainly never be complete. The more the matter is considered, the more assured the deduction that not scientists alone are required, but scientific *specialists*. The botany of various parts of India and their zoology are as much deserving of study as their geology, yet to the last alone has the Government of India given moderate attention. Then again, "botany" embraces many sub-heads, each of which is enough for one man. In fact, there is work for an army of scientists in India, and there is room for the fear that the work of the few who are to be employed will suffer, not through any incompetency on their part, but because of their being called upon for work of too general a character. We live in an age of specialists ; and it is strange that in an agricultural country, ruled by a Government that has shown zeal in regard to progress in many directions, agricultural science should have been so long neglected as it has been, and should still be only trifled with.

FLUCTUATING EXCHANGE.

A FEW facts concerning fluctuating Exchange in other countries may assist our readers in the study of the Exchange problem in India. The influences at work in various countries differ very widely; the effects differ almost as greatly; but where several countries all producing similar commodities for export suffer from the violent fluctuations of Exchange, the *degree* to which each is affected is of less interest to outsiders than a general knowledge of the position. Thus, taking Brazil for example: reviewing its affairs from a very far distance, we cannot pretend to study the many intricacies with which the Exchange problem as it affects that country must necessarily be beset. Considering it, however, as it affects the coffee industry, we can at least draw attention to a few of the chief points, and suggest a broad comparison between the circumstances of coffee-planters in Brazil and in India. The vast difference that there is between the magnitude of the industry in the one country and its size in the other, need not be dwelt upon. What we wish to point out is that, as a country, Brazil has suffered for some years from a currency depression such as affected India from 1873 to 1893. Brazilian figures are, indeed, even more startling than those relating to India; and just as in the one country a reaction has set in, and Exchange begun to rise so, too, in the other; though the upward movement in Brazil is still more recent than that with which Indian coffee-planters are familiar. Of the year 1897 we read in the *Brazilian Review*, to which we are indebted for some of the figures quoted in this article, that the course of Exchange during the year was an almost uninterrupted record of depreciation. Our contemporary regards this as, under the circumstances, inevitable and irremediable. The figures given show oscillations of a violence unknown in India. They are as follows:—

1897.	Average.	Maximum.	Minimum.
	Pence.	Pence	Pence.
January	$8\frac{45}{64}$	9	$8\frac{3}{8}$
February	$8\frac{17}{32}$	$8\frac{7}{8}$	$8\frac{1}{32}$
March	8	$8\frac{1}{2}$	$7\frac{13}{16}$
April	$7\frac{51}{64}$	$7\frac{15}{16}$	$7\frac{5}{8}$
May	$7\frac{5}{8}$	$7\frac{13}{16}$	$7\frac{1}{2}$
June	$7\frac{43}{64}$	$7\frac{27}{32}$	$7\frac{9}{16}$
July	$7\frac{15}{32}$	$7\frac{3}{4}$	$7\frac{5}{16}$
August	$7\frac{7}{16}$	$8\frac{1}{4}$	$7\frac{1}{16}$
September	$7\frac{39}{64}$	$8\frac{1}{32}$	$7\frac{1}{4}$
October	$7\frac{11}{32}$	$7\frac{17}{32}$	$7\frac{1}{4}$
November	$7\frac{7}{64}$	$7\frac{11}{32}$	$6\frac{7}{8}$
December	$7\frac{3}{32}$	$7\frac{7}{32}$	7

Thus, the extremes for the year were:—maximum, January 9*d.*; and minimum, November $6\frac{7}{8}d.$ The average rate for the first half-year was $8\frac{3}{64}d.$ and for the whole year $7\frac{45}{64}d.$ We have only to add that by January, 1897, Brazilian Exchange had rebounded from $7\frac{7}{8}d.$, the lowest figure in the previous month, to 9*d.*!

A comparison between India and Brazil is impossible. Nevertheless it is interesting to set the two side by side, for there are several points of resemblance in the conditions to which these fluctuations of Exchange have been traced or attributed. This will be seen from the following brief summary in regard to Brazil. The depreciation of the currency there is attributed to two distinct causes: excessive emissions and an adverse balance of foreign payments. The first of these two factors is said to have exhausted its efforts, but the second is still at work. In the interests of the Government an enhanced exchange is advocated, and the Government appears to have tried various measures of artificial inflation with more or less success. The sudden rise in January, 1897, was due partly to such measures; but by March the oscillations were as violent as before, and by September a period of 'rot' had set in. This year there has been a recovery, but violent fluctuations are still usual. The balance of trade continues in an unstable condition, and the fall in the price of coffee naturally helps to bring about a preponderance of imports over exports, when comparisons *of values* are instituted.

Seeking a fresh illustration in Guatemala, we find that in 1897 the highest and lowest rates of exchange on London there were as follows:—

	Highest. Per cent.	*Lowest.* Per cent.
January	136	125
February	145	138
March	135	126
April	136	134
May	140	135
June	143	140
July	158	146
August	175	162
September	182	175
October	200	185
November	200	182
December	182	132

Much steadier than in Brazil through the greater part of the year; but note the violence of the oscillations between November and December, from 200 to 132; and the range from the maximum figure of the year, 200, to the minimum 125. It is scarcely surprising to hear of one important bank having suspended payment; for the banks are closely connected with the planting industry, and the ruin of the latter means at least serious damage to the former. There are, of course, influences at work against the planter quite unconnected with the Exchange question, but with these we have no concern now. Our aim, indeed, has been to state facts, not to draw deductions from them; and to show that India is not alone in feeling the hardships of fluctuating Exchange. In one sense, the sufferings of others need be no concern of ours; but in a broader sense, the Exchange problem is international, not national, so that it is desirable that planters should watch its bearings in other countries as well as in India.

LADY-BIRDS.

If interest in this subject has not subsided, our readers will be glad to learn that the *Rhizobius ventralis* has proved its utility in California, where it has been found to attack all the scales of the *Lecanium* family. Imported in June 1892, it increased slowly at first, but more rapidly in the spring and summer of 1893, when the number increased to many millions, and the insects destroyed the scale on the trees wherever they were placed. In September 1893, distribution began, and by about the end of the year 453 colonies of from 25 to 50 beetles each had been sent out, and there were more than 500 applications on the file. The description given of the insect is as follows:—"jet

black, but covered with short fine hairs that give it a dark gray appearance. The male measures one-eighth of an inch in length, and the female three-sixteenths of an inch." Another friend that Mr. Newport tried to introduce was the *Orcus Australasiæ*, Boisd. The female is nearly one-fourth of an inch in length, deep blue in colour, with six orange-red spots on the wing-covers. The male is similarly marked but smaller. As far as can be judged from the reports that have been received, the *Rhizobius ventralis* would probably be the most efficacious destroyer of *Lecanium viride*. It multiplies rapidly indeed. Professor Koebele estimates that a single pair of rhizobiids could produce 15,000,000,000 on a single year. After having practical experience that went far to support this estimate, Professor Cook asked—"why will people spray or fumigate when we can get so easily the *Vedalia* and these rhizobiids." Of the pest in one district he says—"The lemons, oranges, limes, abutilons, oleanders, olives, pittosporums, habrothamnus, etc., were foul with the black scale in spite of all effort to keep them clean by spraying." Of the present:—now, "thanks to the rhizobiids, they are entirely clean and thrifty." Surely, then, the Lady-bird question should not be dropped by planters out here.

THE BRITISH TEA DUTY.

A Ceylon planter has put together a few reasons why the producer should not agitate for a reduction of the Tea Duty in Great Britain? In the first place, he does not think that the consumption, *per capita*, in England can be increased, and he utters a warning that if it could, "the abuse of tea might seriously affect the industry." Yet we hear nothing of "abuse" of tea from Western Australia, where the consumption *per capita* is double as much as in Great Britain. Then, it is said, the reduction of the duty from 6*d*. to 4*d*. per lb. did not affect the price of tea. If that be so, why fear that a further reduction of duty would affect the price of tea and thus stimulate consumption, were stimulation possible. The above correspondent appears to contradict himself when he points out the steady increase in the consumption of tea in the United Kingdom and adds:—"But the increase is more due to the cutting of prices of the blenders—who knock out our teas to suit their blends rather than to the blends suiting the tea,—instead of the decrease in duty, the latter fact enabling the blenders to cut the trade finer as the duty locks up one-third less money than previously." He sums up his opinions by saying that the only result he sees if the duty on Tea is reduced to 2*d*. per lb. is that the blenders will lower their blends by 2*d*. per lb., and being a few, against thousands will knock down the prices of teas another 1*d*. and make more money than they are now doing. He says:—"We want the wholesale country tea dealers to realize that the blenders are doing them out of their legitimate profits, then perhaps they will come into the tea market in London and make a more open market of it than it is now. With the Colombo market yearly expanding, we may hope that the reduced quantity sent to the London market may tend to harden the markets generally in the world. But it will be a hard fight for Ceylon; for, with present prices and high exchange, a goodly number I fear of estates round Kandy and other parts of the island will show no profit this last year, and I think these old districts want more help even than distant Uva and should have railway rates reduced generally and all grant-in-aid and private cart roads taken over by Government. This would help the planters most. This latter will require no increase of staff as Government do the work now, but only supply half the funds." We agree with his conclusions about the reduction of the Tea duty, though not with his method of arriving at them. The small increase that would probably be shown in demand would be counteracted by the fact that China teas of the lowest quality would gain a greater advantage than would fall to their Indian rival. A period of high duties makes for improvement of quality, a period of low duties makes for increase of quantity. The "happy medium" is just about where matters fiscal are now, and there the Indian tea planter should be glad to see them stick.

COFFEE IN DISTANT LANDS.

III.

Cuba.—Mr. Robert I. Hill, of the U. S. Geological Survey, has written a book on the West India Islands. As regards Cuba, he looks forward to coffee becoming a large and flourishing industry if Cuba should be properly developed. The mountain sides and hill lands of the east are especially favourable for coffee, and a quality as excellent as that of the famous Blue Mountain coffee of Jamaica can be readily grown. There is still considerable coffee grown, but all is consumed locally. The mountains about Santiago are admirably adapted to coffee and fruit production. The eastern end of Cuba is one of the finest regions for coffee culture in the world, particularly that portion of the island from Santiago to Guantanamo, and from Cape Mayci to Baracoa over on the northern side. Mr. Hill believes that if Americans ever possess this island, its ores, fruits, healthful climate, and fine mineral springs will make it one of the richest countries in the world.

The mountains of the Antilles are composed of unconsolidated clay and pebble, which yield a wealth of vegetable products to their very summits. "They are the fruit and coffee lands of unlimited possibilities." Of the 45,000 square miles of Cuba only 10 per cent. is cultivated, 4 per cent. forest land, and the remainder, for the most part, unreclaimed wilderness.

Martinique.—The "Liberian" and "Mocha" are extensively cultivated, but exports are small.

Mauritius.—Coffee was grown for many years in this colony, and beans of superior quality were produced. Sugar took its place, however, and although there was a revival for some years previous to 1877, a fungus disease subsequently appeared and destroyed, first, the plants, and, ultimately, the coffee-planting industry of the island. Mr. John Horne, F.L.S., Director of Forests and Gardens, reported in 1886 that Liberian Coffee had been tried in Mauritius but that those who were growing it there seemed to be unfavourably impressed with its growth. He observed, however, that a cross between it and the local variety of the Mocha coffee called "café le roi," possessing the dwarf habit of growth and the fruitfulness of the latter, with the hardness and large fruit of the former. As Mauritius has imported coffee for many years past, we may fairly exclude it from the list of producing centres that compete seriously with India.

Mexico.—Coffee is being cultivated in Mexico with such energy that the country promises to become a very important factor in regulating the proportion of supply to demand.

Any information regarding coffee cultivation there is consequently of exceptional interest.

From an official report dated 1896, we gather that the cultivation of coffee in Mexico dates from the commencement of the present century, and it has long been known that many districts in various parts of the country are probably as well suited to the growth of the plant as any in the world. The unsettled state of the Republic, however, retarded progress in this as in many other respects, and it is only of late years that the capabilities of the country as a coffee producer have attracted the attention that they undoubtedly deserve.

The almost total failure of the coffee plantations in Ceylon and all Eastern countries, and a few bad coffee harvests in Brazil, together with the fall in silver and the consequent reduction in the price of land and labour in Mexico encouraged planting there, and the profits which have already been obtained seem to justify a further extension of the industry. We gather from the report under notice that a considerable area in various States in Mexico is suited to the growth of coffee, but as many conditions are required to ensure its profitable cultivation, great care should be taken in selecting the site of the proposed plantation.

The following are, says the report, the principal points to which attention should be paid:—1. *Soil;* 2. *Climate;* 3. *Communications;* 4. *Labour.*

1. *Soil*—The coffee plant can be cultivated on various descriptions of soil, but it thrives best on light, porous loam of considerable depth, which has not before been brought under cultivation. Clay land should generally be avoided as unsuitable.

In Mexico the best land is generally covered with virgin forests, and clearing it is the first operation the planter has to undertake. A rolling surface is to be preferred as it affords greater facilities for drainage, but very steep slopes are not as a rule to be recommended.

2. *Climate*—The best temperature is one varying between 65 and 85° Fahr., which can be obtained in nearly all of the States in the Mexican Tierra Caliente. Frost kills the plant, and fierce rays of the tropical sun if untempered by abundant moisture are almost equally injurious. Most authorities on the subject agree that coffee thrives best where the rainfall is at least 100 inches per annum, and where it is pretty evenly distributed throughout the year. It should be noted, however, that coffee has been and is cultivated with some success in districts (such as Cordova in the State of Vera Cruz) where the rainfall is far less. Immunity, or at least protection, from high winds is very desirable. An eastern exposure is to be preferred where the weather is generally cloudy, and a western in a sunny climate. Some writers attach great importance to the height of the plantation above the sea, and assign limits of altitude for the choice of a site. It has, however, been shown by experience that suitable climatic conditions are to be found at a wide range of elevation, and that coffee of the highest quality can be grown almost at the sea level. In selecting a site for a plantation too much attention cannot be paid to soil and climate, and it has always been found to be good policy to give even a comparatively high price for land where these were thoroughly satisfactory.

3. *Facilities of Communication* are also of great importance. Railways have been much developed of late years, and their extension is being carried on rapidly. Still, some districts which would otherwise be very suitable for coffee planting will probably for some time be too inaccessible to be recommended.

As freight is generally cheaper by water than by land, a navigable river in the neighbourhood of the plantation is to be preferred even to a railway. In many parts of the country roads can scarcely be said to exist, and the necessity for railway or water communication to within a moderate distance of the plantation is even greater than it would be in more advanced countries. It must also be borne in mind that the cultivation of coffee is almost always combined with that of other crops, some of which are very bulky and cannot easily be disposed of without facilities of transport.

4. It is very desirable to settle in a district where *Labour* is easily obtained, and although some authorities maintain that imported labourers are more easily controlled, the expense of introducing them is considerable, and many practical difficulties have to be overcome.

The wages paid vary in different districts, but the average rate for the whole country was officially estimated in 1892 at 37 c. Mexican currency (or 9½*d*) per diem. Since that date prices have certainly risen, and the daily wage is now generally placed at about 50 c. (1s. 1d.). Both employers and employed frequently prefer piece-work to a daily wage, particularly for such work as clearing land before planting the coffee.

The Mexican labourer requires careful handling if the most is to be made of him. A rich soil and a tropical climate supply nearly all his requirements, with little effort on his part, and he will not easily submit to harsh or unfair treatment from his employer.

For the present, the above must suffice, but we shall revert later to the subject of Coffee Cultivation in Mexico.

Panama.—The coffee exported during 1896 was valued at £987,192. Growers felt a certain degree of uneasiness on account of the depression in prices which has been experienced since the early part of last year. This depression is attributed to the enormous amount of coffee exported from the Brazils.

Peru.—Reports from Callao state that the cultivation of coffee is on the increase there, and that it bids to become one of Peru's staple articles. The latest figures available show that the export for 1896 was about 1,066 tons.

The Philippines.—The first large coffee-plantation in the Philippine Islands was established in 1826, seed having been originally imported from Brazil. About fifteen to twenty years ago there was a rapid development of production, but still more recently it has been neglected. The *North Borneo Herald's* correspondent remarks that this is probably due to the revolution, for the coffee is of good quality, some of it excellent.

He points out that coffee requires some capital on the part of those who undertake it. It takes the trees four or five years to begin to bear. Those who are able to make the necessary advances have prospered greatly, and, especially about Manila, have become rich.

The exported coffees formerly went exclusively to France, but are now scattered well over Europe, usually through Singapore. They are of two sorts, the Manila and the Zamboanga. The first is grown about Manila, chiefly to the south and east of Manila Bay. It has a small berry and is more highly prized than the other. The Zamboanga coffee is produced in the south, principally on Mindanao and the Sulu Islands. The berry of this variety is larger, but less care is used in its preparation. It goes directly to Singapore.

THE LABOUR QUESTION.

WE give to-day a general summary of the decision of the Government of India with reference to the report of the South of India Planters' Enquiry Committee. This decision would appear likely to be in the main fairly satisfactory to planters, but it is perhaps safer to reserve comment until the full text of the resolution is received. Much will necessarily depend now upon the manner in which the proposed amended Act is drafted by the Madras Government. We trust that the work will be taken in hand without delay, and that every effort will be made to enable the Government to frame a law that shall be fair alike to the just employer and the honest cooly. Safeguards against dishonesty on the part of the latter will doubtless be counterbalanced by safeguards against injustice on the part of the former, not because such injustice need be feared, but simply to give a proper tone of impartiality to the new Act.

MANURING OF TROPICAL PLANTS.

Mr. John G. Hamilton's recent remarks on Manures having failed to attract criticism or remark—most probably because all writers on the subject were requested to sign their names—we now propose to give some interesting papers on the subject of manuring, taken from a German source. German scientists have conducted exhaustive experiments in regard to the properties and components of soils, and the use of artificial fertilisers, and the following articles reproduced from a pamphlet issued by the Verkaufs Syndikat der Kaliwerke, Leopoldshall-Stassfurt, will be found to contain much that is of value and interest to planters in India.

INTRODUCTION.

One of the most important conditions for the healthful growth of every plant is the presence in the soil of the essential plant-food ingredients in such a form as will ensure their ready assimilation by the plant.

These plant-food ingredients were originally present in the soil in large quantities, although not readily available. The decomposition of these materials takes place more rapidly in tropical and sub-tropical than in temperate regions.

For this reason, the natural production of the soluble ingredients in tropical soil, corresponds very closely to the quantities of plant-food ingredients removed by the various crops, and, as a general rule, the necessity of restoring these materials by artificial means arises sooner in temperate regions than in the tropics.

On the other hand, the restoration, by natural agencies, of plant-food ingredients consumes more time in temperate regions, on account of their slower transformation into a soluble state; the soil is relatively more rapidly exhausted in the tropics, and only by artificially supplying it with the necessary plant-food ingredients can such rapid exhaustion be prevented.

Moreover, complaints about "worn-out" soils are more frequently heard in the tropics than in temperate regions, because, in the latter, rational cultivation is in its prime, whilst in the tropics it is, with very few exceptions, still in its infancy; in other words the system of continuous cropping is still the leading principle of agriculture in the tropics.

On account of the immense tracts of new land available in the tropics, this system could be followed, to a large extent, without much damage, for as soon as a soil became worn out cultivation could be begun anew on a virgin soil.

For various reasons, this system cannot be so easily put into practice at the present time, and the planters in the tropical and sub-tropical regions are accordingly compelled to resort to a rational system of fertilisation, and to supply their fields artificially with the necessary plant-food ingredients that have been withdrawn by continuous cropping for many years. As, however, a system of rational cultivation has been but recently begun, agricultural experiments, which are so necessary to its success, and which have been so useful in temperate regions, are hardly as yet in an advanced stage.

The system of making agricultural experiments owes its development to the recognition of the fact that only through such can we discover the right methods to be pursued in bringing back soils to their former state of fertility.

Therefore the results obtained from such a system of rational cultivation in tropical regions, although yet few in number, are of great importance, not only in encouraging planters to follow new methods, but also in inducing them to cultivate anew old soils that were formerly regarded as unproductive.

PART I.

GENERAL REMARKS ON TROPICAL MANURING.

Every planter knows that the plant-food ingredients, even in the best soils, will disappear in the course of time. The plants will become less vigorous in their growth, and the yields will consequently diminish in proportion, even in spite of the fact that they may be received the best of care otherwise.

This result is due not only to deterioration in the physical condition of the soil, but also to the loss of certain plant-food ingredients, the presence of which is absolutely essential to the growth of crops. Plants require a large number of elements for their proper nutrition, which are gathered from the air, the soil, and the water in the soil, by means of roots and leaves. The substances taken from the air and the water, are already present in sufficient quantities, and besides this the earth contains sufficient supplies of those mineral substances which the plants only require in smaller quantities. On the other hand, the supply of the most important plant-food ingredients, *i. e.*, nitrogen, phosphoric acid, and potash, is limited in most soils, as these elements have been principally removed by continuous and vigorous cropping. The three ingredients just mentioned must therefore be artificially supplied sooner or later. In addition to the three substances mentioned, there is also lime and sometimes magnesia. These, however, need only be supplied in certain soils which are deficient in those ingredients.

The object of fertilisation is to supply to the soil, in an assimilable state, those ingredients in which it is deficient. Fertilisers may be divided into several groups, according to their composition and to the effect they produce.

A.—NATURAL FERTILISERS.

Under this heading are included those materials of a vegetable nature which are obtained from the refuse of the kitchen, the excrement of animals, &c., and which contain the ingredients necessary for the growth of plants.

Stable manure plays an important part in agriculture in the countries of the temperate zones, but in tropical regions it is very seldom available in sufficient quantities, owing to the fact that the dairy industry in itself is not much developed; also because the greater portion of animal excrement is lost, the animals, as a rule, not being fed in stables. The manure that is collected consists of only dry dung. The urine, which is much richer in nitrogen and lime, can only be saved through absorption by means of straw and litter, and, of course, this method cannot be practised, unless the animals are fed in stables. Well-prepared stable-manure, in addition to the large percentage of plant-food it contains, exerts a beneficial influence on the mechanical condition of the soil, on account of the litter with which it is mixed. The addition of humus is one of the greatest importance in increasing the productiveness of soils, as this substance is very rapidly consumed in tropical climates. When dung and urine are gathered without litter, a mixture is obtained which contains plant-food ingredients in an effective form. The application of liquid manure offers many advantages, but, on the other hand, the difficulty and expense of collecting and applying this material should not be lost sight of.

In order to utilise all of the refuse substances, composting may be resorted to, and composts form a very valuable fetilising mixture. The addition of earth, mud, lime, marl, &c., is absolutely essential, in order that the decomposition of the mass may be accelerated. Most planters are familiar with the rules for making composts; it should, however, be mentioned that the fertilising value of the compost can be increased by the addition of potash salts and phosphates, say 65lb. to 110lb. of muriate of potash and 110 lb. to 150lb. of some phosphate to every 35 cubic feet; these should be well mixed and applied between the various layers. If the compost is to be applied to tobacco or sugar-cane, sulphate of potash should be used instead of muriate.

Composts are most advantageously employed in the setting of young trees; for this purpose 5¼ to 26½ quarts should be put into each hole, and mixed with good soil. This method ensures more certain growth and a more rapid development of the trees.

As stable manure is not available in sufficiently large quantities in the tropics to make it an important factor in the fertilisation of crops, the preparation of composts is only possible in a few cases. The planter must, therefore, turn his attention to other materials, and first of all to the residues obtained in the manufacture of commercial products from oil-fruits In this connection may be mentioned cakes made from soja beans, from earth-nuts, castor, palm-kernels, cocoanuts, cotton-seed, olive-oil, sesame, &c., which form important articles of commerce in several countries, and whose great importance in tropical fertilisation is evident. In their effect they occupy a position midway between stable manure and artificial fertilisers. These cakes should be really classed as nitrogenous fertilisers, on account of their large percentage of nitrogen (2.5 to 7 per cent.) and small percentage of phosphoric acid and potash. The organic nitrogen contained in these fertilisers is very rapidly and completely brought into use, corresponding in this respect to the rapid decomposition characteristic of the tropics. Other and similar residues are leached indigo plants, coffee-shells, &c

But even these materials are by no means present everywhere in sufficiently large quantities to satisfy the demands of fertilisation without considering the fact that these substances, especially the oil-cakes, can be employed more rationally and advantageously in feeding cattle. It should, therefore, be the object of the planter to provide a substitute which has no limit placed upon its application, and this substitute is presented to him in the shape of green manuring with potash-phosphate fertilisation.

Leguminous plants furnish the humus required by the soil, and at the same time gather nitrogen from the atmosphere in sufficient quantities. In this way nitrogen is obtained more cheaply than by any other means, and it is, moreover, more valuable in this form than in stable-manure. When green manuring is employed, potash and phosphoric acid should be provided artificially by means of potash-phosphate fertilisation.

"Leguminous plants promote the formation of dew, keep the earth moist, prevent the growth of weeds, loosen the soil, and supply nitrogen to it, accelerate the decomposition of the mineral ingredients contained in the young grain, increase the amount of humus, and properly regulate the fermentation of the soil." (Dr. Stutzer.)

Green manuring ensures the best results on light and sandy soils.

Leguminous plant should be sown in the beginning of the rainy season, and ploughed under about two months later.

Among the Leguminous plants suitable for the tropics may be mentioned indigo, earth nuts, soja-beans, and cow-peas (Dolychos).

As mentioned above, leguminous plants are fertilised with potash and phosphoric acid, and these ingredients are also beneficial to succeeding crops.

The natural fertilisers previously referred to do not satisfy the demand, for, aside, from the limited production of one or the other of them, not one contains the plant-food ingredients in sufficient proportions, and consequently the addition of so-called "artificial fertilisers" is necessary. It is to these that the planter must turn at the present day.

THE OUTCOME OF THE S. OF I. PLANTERS' ENQUIRY COMMITTEE.

AFTER considering the report of the South of India Planters' Enquiry Committee, and replies to various references with respect thereto to the Governments of Madras, Bombay and Mysore, the Government of India has according to a telegram from the Calcutta correspondent of the *Madras Times*, adopted a resolution to the following effect :—

"The Madras Government accept the proposal of the Committee as to the re-enactment of Madras Act V. of 1866, and would apparently provide in the proposed legislation for the execution of warrants and other processes issued by the Courts in the three Native States under a labour law of identical character. The Dewan of Mysore, on the other hand, considers that the Assam labour law is unsuitable, and would prefer to amend Act XIII. of 1859. The Government of India have repeatedly expressed their inability to undertake the amendment of that Act, with a view to make it more effective as a means of enforcing labour contracts for tea gardens in Assam, as the Act was originally not meant to apply to contracts of this description, and is unfair and one-sided in its provisions, and liable to be misunderstood and misused. They are constrained to agree with the Government of Madras that, if special legislation is required for the coffee industry in Madras, it will have to take the form of an amendment or re-enactment of Madras Act V. of 1866. This, in effect, would provide a labour law of special application to Southern India, which, while enabling the employer to enforce through the Criminal Courts a statutory contract against the labourer in the absence of misconduct on the part of the employer, will enable the Magistracy to require from the employers fair treatment of labour, and will refuse help to an unjust employer. Many circumstances which made the Assam Immigration Law excessively elaborate and minute, and in its working costly to the tea industry, do not exist in Southern India. In Southern India labour is much nearer planting districts, much more mobile, and by habit and experience much more self-reliant and able to protect its own interests. It goes and returns at short intervals, and long-term labour contracts, such as are a necessity in Assam, are practically unknown in Southern India and should not be countenanced by any law which may now be enacted. The Government of India are therefore of opinion that if legislation is required for the regulation of labour contracts in Southern India, the maximum statutory term of a contract penally enforceable should not exceed one year, or at the utmost two years. The evidence is that labourers are generally well-cared for on estates, and that excessive mortality is unknown on coffee plantations in Madras and Mysore. This will possibly dispense with many provisions of the Assam Act, though it will be necessary to take power to inspect plantations and enforce sanitary regulations." The Governor-General, after a careful consideration of the recommendations made by the Committee which have met with the approval of the Madras Government, does not object to the Local Government putting them for a closer examination into a legal form. Until this is done, and the effect of the proposed measure can be more precisely seen, he reserves final conclusions on the subject.

It has been already said that a statutory labour contract for a long term is not required. If found necessary to prescribe the statutory contract, the Governor-General considers that the labourer should be at liberty to rescind it at any time without notice, on repayment of the advances due by him and of specified forfeit money, and with a notice that on the repayment only of the advances due the contract should be liable to be cancelled by a Magistrate on specified grounds. Its enforcement by a Magistrate should be strictly conditional on the labourer having been properly treated by the employer Guarantees for enforcing fair treatment should be provided on the general lines of the Ceylon and other labour laws, and the extent to which advances should be recoverable from labourer should be carefully considered. As regards the compulsory registration of labour contracts in districts of recruitment, Government are disposed to think that such a system is foreign to the practice in the Madras Presidency, as witnessed by the complete failure of Madras Act V. of 1866. Necessity for legislating in this matter will require careful consideration.

The question of extradition is a difficult and far more reaching one. The Committee recommend—(*a*) that the Native States of Mysore, Travancore and Cochin be invited to adopt the amended law; (*b*) that the execution of the amended law be made reciprocal between the Madras Presidency and Coorg on the one hand, and the Native States of Mysore, Travancore and Cochin on the other, by a convention, or mutual agreement; (*c*) in default of a convention (i) that British Magistrates be empowered to give effect to the orders of certain Magistrates in Native States in respect to fraudulent breaches of contract under the amended law, or (if there be no amendment) under Act XIII. of 1859, or preferably (ii), that Magistrates in British India and in the Native States of Mysore, Travancore and Cochin be empowered by their respective Governments to deal with persons found within their jurisdiction who commit fraudulent breach of contract (as above explained) across the border; (*d*) that in the event of either of the above suggestions (B) or (C) (ii) being

accepted, the Mysore State should no longer be exceptionally treated in respect of British processes in breach of contract cases.

The Government of India has given careful consideration to this difficult subject. Their provisional conclusion is this:—Should the proposed legislation for the amendment of Madras Act V of 1866 be undertaken, there would be no objection to including in it a provision for execution in the Madras Presidency of criminal processes issued by certain courts, under due safeguards, of the Native States of Mysore, Travancore and Cochin, if and when, and as long as, a similar law is in force in each such State. With regard to warrants of arrest issued under the proposed labour law, Government think when any such warrant is sent to another district for execution, it should be discretional to a magistrate of such district, to accept bail for appearance before the court issuing the warrant, or to act in the manner prescribed in Section 19 of the English Statute at present applicable to cases in which extradition from India is sought by the courts in Ceylon. In the special case of Coorg it could be met by extending to it by means of a regulation or notification under the Scheduled Districts Act, 1874, the provisions or certain provisions of the proposed Madras labour law. There remains the question of amending the Madras Act VIII. of 1878. The Coffee Stealing Prevention Committee deal with this question at length in the last chapter of the report, in which, after tracing the history of Madras Act VIII of 1878, it is recommended—1st, that Section 9 of that Act be amended by the addition of the words: "Parchment and cherry dried" coffee, (2) that Sections 5, 6 and 7, which apply only to purchasers of coffee, be also made applicable to sellers; (3) that power be given to Government to prescribe forms for books and accounts for recording the sales of coffee, to require returns of produce and verify entries in them by inspection. These recommendations have the support of the Government of Madras, who are prepared to give effect to them by legislation in the local Legislative Council. A communication on the subject of the proposed legislation is being made to the Secretary of State.

NOTES.

Tea and Theine. The latest suggestion in Ceylon is the establishment of a Company to buy up tea-dust and low grade teas and turn them with "Theine."

Sale of a Ceylon Tea Estate. Mr. T. Y. Wright has bought Galphele Estate, in Wattegama, for Rs.68,000. It consists of 165 acres, of which 150 are under tea cultivation.

Cocoa in Grenada. Sir A. Malony, the Governor of Grenada, states in his report that the Cocoa Crop of the year reached a total of 54,597 bags, being the largest since 1893-1894, when the record crop of 55,666 bags was gathered.

Coffee in Mexico. Further developments are in contemplation. The Mexican Plantation Company, of New York City, has been incorporated, to deal in real estate and raise coffee in Mexico. Capital stock, $100,000. Directors—Archibald M. Pentz, Charles Francis Jones, and W. F. Peters, of New York City.

Cinchona in Ceylon. A home correspondent writes to a Colombo paper:—"By all means let planters, especially those living on the fine soil of Uva, plant up their road lines and corners with the best plants they can get, and in a few years time they will find their reward, for it looks as if there was going to be a scarcity of quinine in the near future."

Nitrogen from the Air. It is stated that by some new chemical process nitrogen, in the form of sulphate of ammonia, is now obtained artificially from the air. The cost is put at 20*s.* (£4) per ton, and in addition a by-product is obtained which will have a great effect on gas manufacture. If that be so, then a great boon will have been conferred on agriculturists, but until actual facts are to hand it will be well to suspend judgment.

Coffee in the West Indies. As showing the value of Jamaica coffee, we may note that a Kingston correspondent reports sales at 34s. c.i.f. on the Continent for "good ordinary," and says that merchants there are paying 24s. to 25s. per 100 pounds for that description. It does not sound like profits! And another correspondent in the West Indies remarks that locally, Coffee and Pimento realize 15s. to 20s. per 100 pounds.

The Consumption of Tea. Papers such as the *Pioneer* attribute the "decline of demand" for coffee to the ease with which tea can be brewed by comparison. This is by no means a fair view of the matter. The chief factor of late years, affecting demand for Tea as well as for Coffee, has been the rapid evolution of *Cocoa*, and the enormous extent to which it has been advertised. It is in the increase of demand for cocoa that we find the chief cause of the comparative falling off in consumption of coffee. Tea has had little or nothing to do with the matter.

The London Tea Market. Cabling to Colombo on 19th instant, Messrs. Gow, Wilson & Stanton reported a generally steady market, with a tendency to advance. The tendency was not reflected in the averages, however, which still stood at 6½d. for Ceylon Pekoe Souchong and 8d. for all Ceylon Teas sold on Garden account. Reuter's description was "generally firm at previous rates," and his average for Ceylon was 8⅛d. for Indian 9¼d. (the latter being ⅜d. up). Of Ceylon Tea 15,000 packages were sold out of 17,000 offered, of India as 53,000 out of 56.

Encouragement for Tea Planters. It is satisfactory, says the *Produce World*, to see that outside markets have considerably extended the consumption of both Indian and China Teas. These markets are becoming a great support to the industry. During the last nine months an increase in the quantity has taken place to the extent of 8,059,000 pounds over that of the same period last year. It is estimated that in the home market the consumption has increased about 8,250,000 pounds. The Indian yield is only expected to be about 2,000,000 pounds more than last year, and the Ceylon crop only a fair one, so that there is every reason for planters to hope for better prices.

Retail Sale of Coffee. At a General Meeting of the Selangor Planters' Association on 17th ultimo, the Chairman said he had received from Mr. F. A.

Toynbee the draft of a scheme for the retail sale of coffee in Exeter. Mr. Toynbee had taken great trouble to work up this matter and had found that although the large dealers would not touch it, the smaller men were prepared to support it, and he wanted the Selangor planters to supply him with a ton of coffee per month to meet this demand. The Chairman understood that possibly the Hauthornden Association might take up this matter and supply Mr. Toynbee with the necessary coffee, so in the meantime nothing need be done by the Association.

Coffee from Queensland. Within the past few weeks, says the *Produce World*, a small consignment of Queensland Coffee in the husk has been given to a well known firm of brokers in Mincing Lane to realize. It was husked and cleaned by reliable wharfingers, and turned out to be rather small but very pretty coffee, well cured and dried, and comparing favourably with Central American, the estimated value being from 50s. to 60s. per cwt. There are considerable areas of land suitable for the cultivation of coffee in Queensland, so no doubt this industry will be further encouraged in the future. The object of this shipment is not so much to find whether a market can be found here, as to have London experts' opinion as to the quality and to gain information in respect to the further improvement of same, for no doubt the "Cornstalks" will be able to consume all that is produced for many years to come.

Tickling the German Palate! The "Thirty Committee" in Ceylon has passed a resolution "that the Committee regrets that any expression used should have given offence to the German community and that the attention of Mr. Wm. Mackenzie and the Editor of the *Tropical Agriculturist* will be drawn to the incident as the Committee had no knowledge of it." The expression here referred to is contained in a letter from Mr. Wm. Mackenzie. The words read :—"In France there is to be the grand opportunity of the great exhibition. There are tea-drinking English families everywhere *economising*, and the French are *not beer-sodden* like the Germans." It was a curious way of catering for German trade : and, really the apology is almost as bad. The committee is apparently not sorry for having called the Germans "beer-sodden" but regrets that the term should have given offence!

The Consumption of Tea. The New Zealand official year book for 1898 gives the following information regarding Tea :—The quantity of tea entered for consumption in 1897 was 4,564,840 lb. Supposing Maoris to use, on an average, 1 lb. per head per annum, the consumption of tea per head of the population, exclusive of Maoris, would be 6·27 lb. in 1897.

A reliable Insecticide. A very valuable discovery has been made by Professor R. C. Kedsie, of the Michigan Agricultural College and Experiment Station. He has discovered a spraying mixture more reliable as an insecticide than Paris green, and which does not burn the foliage of the trees, and it costs less than 4 c. (2d.) a barrel. It is not patented, and here are his directions for making it :—Boil 2 lb. of white arsenic and 4 lb. of salsoda for 15 minutes in two gallons of water. Put into a jug and label "Poison," and lock it up. When you wish to spray, slake 2 lb. of lime, and stir it into 40 gallons of water, adding a pint of the mixture from the jug. The mixture in the jug will cost 45 c., (say 2s.), and this is enough for 800 gallons, or 20 barrels of spray. These 20 barrels will require 40 lb. of lime which will cost 20 c. more, making the total cost 65 c. for 20 barrels, or 3¼ c. (say 1½d.), per barrel. Its advantages over Paris green, states the *Michigan Advocate*, are as follows :—It is cheaper, and the ingredients can be found in any Chemist's shop ; it is easily prepared and easily kept ready; it will keep for any length of time, it is uniform in strength ; it does not injure the leaves of the trees or plants ; it colors the leaves white, showing how evenly it is distributed.

Cocoa and Rubber in Fiji. In on admirable speech to Council recently the Governor of Fiji stated that a sample of cacao grown in the Government Gardens and cured by Mr. Yeoward has been valued in London at 75s. the hundredweight. A higher valuation would have been obtained if Mr. Yeoward had had more experience in curing ; but even at 75s. the hundredweight the cultivation of cacao on suitable soil in Fiji should prove a very remunerative undertaking. It is observed that the process of curing, though not very difficult, requires more care and attention than the average Fijian would be capable of bestowing on it, and he therefore does not anticipate that for many years to come cacao will be added to the list of native grown products ; but it would appear to be well worth the notice of European settlers in the country. During the last twelve months, the Governor added, "I have had samples of rubber collected from numerous varieties of rubber-producing trees and creepers in many parts of the colony, and sent to London for valuation. They have all proved practically valueless with the exception of one produced in Colo North by Mr. Joske from the *ficus obliqua* (locally known as Baka) which was pronounced useful for mixing with better

Shencottah.

qualities of rubber in the manufacture of cheap goods, and valued at from 1s. to 1s. 3d. a pound. Commissioner Joske intends to promote the production of this rubber in some of the districts in Colo North where the *ficus obliqua* is found in abundance, and where the native taxes are now principally contributed in maize.

Tea and Cinchona on the Nilgiris.

The *Ceylon Observer* of the 19th instant says :—"Mr. T. C. Anderson, who returned to-day from a visit to his property in the Nilgiris, reports tea there to be in a very flourishing condition, and is confident that by and by it will come to have as good a name as that of Darjeeling. Cinchona cultivation is also being gone in for extensively." The *Times of Ceylon* remarks :—"Mr. T. C. Anderson, the well-known Maskeliya planter, has just returned from the Nilgiris, where he owns an estate, very pleased with the condition of his tea and cinchona. His property is twelve miles from Ootacamund, from which an excellent and level cart-road leads through his estate, and the distance can be done on a bike in a trifle over an hour. The elevation is 6,500 ft., and the climate dry and cold, much superior to Nuwara Eliya with its chronic damp. The 150 acres of tea which are on Mr. Anderson's estate, are, we are surprised to hear, over thirty years old, having been planted as long ago as that by a General Morgan. The stems of the trees are enormous; and, while a very fair yield of between 400 lb. and 500 lb. is obtained, Mr. Anderson has just been seeing to the erection of the most improved machinery, which he trusts will result in better prices being obtained, there having been no machinery on the estate hitherto, and the manufacture having consequently been of a very primitive nature. The cinchona *(Robusta)* is also doing very well, and there is no sign of canker on his or on any of the other properties in the district, where a cultivation which proved so disastrous in Ceylon is thriving exceedingly, the Government of India buying the bark at London prices for local manufacture, and thus saving the expense and the trouble of shipping to England. With such prospects and with such an excellent situation and climate, Mr. Anderson's estate, apart from its profit-producing capacity ought to be a valuable residential property. Mr. Geo. B. Tringham, son of the Dolosbage planter, is in charge of the estate."

LETTERS TO THE EDITOR.

RINDERPEST.

Dear Sir,—I note in your issue of the 7th, the preventative or remedy advocated by General Morgan for rinderpest. This has been well-known, and practised in parts of S. India where caste prejudices do not exist, or where "low caste" people can be got, and taught how to prepare, and apply the "meat juice." But in these parts some other remedy must be looked for. I have some idea that Mr. Sturgess' preventative can be carried about in a bottle, and applied with a syringe or some surgical instrument, and should much like to know more about it.

Kadur District. D.

BLACK PEPPER.

Sir,—I have read with much interest your reproduction from the *I. P. G. re* black pepper ; and, as it is practically an answer to a former letter of mine on the subject which appeared in *P.O.* I am constrained to add a few further remarks based on my confessedly little practical experience.

While agreeing in the main with the *I. P. G.*, I still think a great many points require elucidation. The question of rearing pepper vines from seed is very tastefully avoided whether from total ignorance on the subject or from lack of that essential practical experience which has so seriously handicapped me.

I shall take this opportunity to give my own experiences with seed, and I hope that by thus making them public somebody may be saved from going and doing likewise. Should any one want to try the experiment, I think, I can guarantee, a fraction over 99 per cent. failure.

The seed was first dried in the sun about the month of February and put out as follows at the beginning of the Monsoon (1st June) a hole half a yard long by a foot deep was dug at the foot of each tree and the earth again filled in ; 5 seeds were planted in each hole, *i. e.*, placed within one quarter inch of the surface of the filled in earth and covered up with dried leaves. As about a bushel of seeds were planted out in this way I had sanguine hopes of a grand display of young pepper for the ensuing year. In this, however, I was cruelly disappointed, as not more than one per cent of the seeds came up. As I said before, pepper is indigenous here and was very plentiful before a blight which destroyed a large proportion of it made it necessary to try and grow pepper from seeds or cuttings. Another thing that led me to expect better results from my seed plantings was the fact that the ground where the vines originally grew spontaneously is covered with pepper spreading itself out in all directions evidently in search of trees or something to climb up. So far as I am aware, pepper thus creeping along the ground never gives any crop, but when it finds a tree or the stump of one or even a rock or boulder it grows up and bears or does not bear according to its sex, male or female. This creeping pepper I am inclined to ascribe as the product of the seeds which must have fallen from the original vines. On this assumption I naturally concluded that seeds put at the bottom of a tree at the beginning of the rainy season would spring up, when I could train them on to the tree if they showed any inclination to go in a different direction. Judge of my disappointment then at a total failure of the whole scheme. The seed were carefully selected. Evidently I made some grave mistake in my treatment and putting out of the seed. Perhaps somebody who has tried it will give his experience in raising black pepper from seed.

GENERAL ARTICLES.

QUALITY *v.* QUANTITY.

R. W. G. in *the Indian Sportsman*, contends that it would be far better for all concerned to manufacture a sufficient quantity of drinkable tea that would at once go into consumption, than send in a quantity of unsaleable rubbish which nobody wants and which only goes to increase stocks, thus giving Ceylon and China a further opening. Assam can, and does, make good strong-bodied teas which will always be in demand by the trade, and without which, the blendings would be considerably weakened, both in strength and flavour. Darjeeling, when fine, cannot be beaten so far as their special and peculiar flavour, which so closely approaches the finest quality of China tea, but when poor in cup, they are thrown out, and the hill teas of Ceylon are taken for choice. Dooars are variable in quality, but when good, as they were in 1897, blenders take them freely, thus showing that they will have good stuff. We are sorry to find that last year's crop from the Dooars was very inferior in quality, due, we believe, to adverse climatic influences. Cachar and Sylhet can do much better than they have done during the past year: this applies chiefly to *bheel* gardens, the managers of which are inclined to pat themselves on the back and say:—'Fourteen maunds of *pucka* tea per acre, my boy!" Yes, fourteen maunds per acre, perhaps, but how much of it goes into consumption and how much into bond? They would do better to be content with, say, seven or eight maunds per acre, and get round their gardens every week. It is most aggravating to shareholders, and every one concerned in the tea industry, to know that these fine good *jat* yielding gardens can only show a miserable five-anna average—hardly that, in fact.

In some seasons climatic peculiarities make the production of good teas difficult: but we believe that with fine plucking and close attention to manufacture, good results may always be attained; and that it should never be necessary to turn out, as has been sometimes done, great masses of tea so inferior that no grocer or blender will take it except at ruinous prices. The old idea that low prices stimulate consumption must be classed with other obsolete theories, and the fact must be recognized that the British public will not take rubbish at any price. That there is a good deal of common stuff still going forward cannot be desired, not because it is not, possible to make better, but because a short-sighted policy is adhered to in some cases, and quantity, the very thing that dealt the death below to China tea, is made to the detriment of quality, which should be the first aim of every planter, and we believe that nine out of every ten men would only be too glad to sacrifice quantity to quality if they were allowed to have their own way. The market does not require teas of the very finest quality, but what it does require is something that is not absolutely rubbish, such as many gardens in Cachar and Sylhet have been producing. Our advice to planters is it go in for the best medium quality teas their gardens can produce. We are not advocates of the very finest plucking, but believe in a good medium system being adhered to. "Two leaves and a bud," and nothing over seven days old.

THE TEA MARKET.

THE future of this market seems to be a little more hopeful owing to the great expansion of the demand in countries outside the United Kingdom. In the nine months ended September 30 last these outside markets have consumed over nine million pounds more than in the corresponding period in 1897, and the following figures show that the demand has been steadily increasing for some years past:—

		lbs.			lbs.
1898	...	42,918,654	1895	...	20,002,230
1897	...	34,859,215	1894	...	20,905,531
1896	...	28,250,961			

Fully one-half of the total for 1898 was shipped direct to these foreign markets from Calcutta and Colombo. Ceylon tea is most in favour, the increase being about six millions pound as against less than two millions of Indian varieties.

In addition to the increase foreign demand there has also been a larger home consumption. Last year, it will be remembered, there was a decrease in the latter, owing partly, it was said, to the Engineers' strike and partly to the efforts to push cocoa. This year the increase is well above the normal. For various reasons the Indian growers are expected to supply the United Kingdom with only about 2 million lbs. more than last year, while Ceylon only shews an increase of from 3 to 4 million lbs. Stocks are, therefore, diminishing instead of increasing, as in past years, and a healthier tone prevails in the market. Some stress is laid upon the altered conditions of trading, which are expected to lead to an improvement in business later on. The great difficulty in the tea-trade is that four-fifths of the Indian shipments are made in the six months from August to January. In those six months of 1897-98 the shipments exceeded the deliveries, by about 34 million lbs, and this surplus stock had, of course, to be held by the market until supplies grew more moderate. The old firms had been accustomed to hold the smaller stocks of earlier days, but their resources had not grown with the expansion of the business, and in the last few years there has been a greater tendency to push the stock on the market when the conditions were unfavourable. Buyers, knowing the weak state of the market, did not come forward and took as little as possible in order to gain every advantage from forced sales. There is a limit to this state of affairs, and the creation of a number of joint-stock sellers of tea is helping to improve matters. These large dealers with their numerous shops find it advantageous to buy in considerable quantities, and as direct from the growers as possible. Their resources enable them to carry their stocks for some time, and as their number increases the competition when prices are depressed tends to grow. So far this new order of things has not had much effect, but prices have improved a good deal of late, and it his hoped that the development of competition among buyers may strengthen the market for Indian teas. Ceylon teas do not suffer from the same cause, except sympathetically as the produce from the island comes in fairly regularly each month, and at no time do shipments exceed delivery to any great extent.—*Investor's Review.*

COFFEE, &c., IN NORTH BORNEO.

THE following are extracts from a letter from a gentleman on his way between Labuan and Sandakan to a friend:—

This year began with troubles with the natives of the interior, but those came to an end and now our revenue shows an increase over last year and the prospects for 1899, as shewn by the prices offered for the farms, customs, spirits and opium, are better than they have ever been. The tobacco crop, on the average, is larger per estate than any hitherto gathered—and the report as to quality is favourable. The price of Liberian coffee has gone up from $17 to $23 and the exports in 1899 will, I believe, be much larger than this year. We have done a little in india rubber this year and more applications have been received for land and as we have a lot of suitable land I hope to see this industry increase. The Pará rubber planted on the east coast and in Marudu Bay is doing very well—it grows at a tremendous rate (a foot a month) and is therefore an interesting cultivation. Cocoanut plantations are increasing and the established ones are being increased and before long we shall export a lot of copra, etc., the price for which is now very high. I met a prospector for land for planting ramie and assisted him to select a block of 600 acres adjoining the railway line and while I was working on that side Mr. E. Walker came over to select cocoanut land for Mr. A. E. Wright, which he finally did, also on the railway line, and on the banks of a small river in a populous district, two miles from the water terminus, Weston The soil in that district is good and the natives grow enormous quantities of fruit, cocoanuts, durians, rambutams, jack, mangoes and so on.

At Kudat I visited Taritipan coffee estate: the coffee is gradually covering the ground and the pickings are now extending over 170 acres and require 80 pickers—probably more in January. The cisterns were full of coffee and the store work requires a number of coolies. The drying is done with a fan and a hot air chamber. Fifty bags were being loaded in carts at the store for conveyance to the boat, and Shipment to Singapore, so that the estate on the whole presented a thriving and busy appearance. The number of coolies on the check roll is 130 odd and the coffee is quite clean—except one field. The weeding is done every 21 days. No pruning is done except taking off suckers and the trees are not allowed to grow more than about 12 feet high. If coffee was looking particularly vigorous—no black berries or dead branches, and the cher-

ries are certainly much larger than last year's which I attribute to the forking. One field has been forked twice and manured with pulp and it has responded and has a splendid show of wood. A nice blossom was out all over the estate and as the blossoms have been continuous since the 1st September and the big blossoms have yet to come, I anticipate a heavy crop on this estate in 1899.

At the present time I think North Borneo offers a profitable field for young men with a little capital. There is a certain amount of employment obtainable from the timber companies who want assistance in getting timber out of the jungle, from Europeans who can get labour. The timber land is found by the Company and they pay contract prices for timber delivered alongside the steamer or on the foreshore. There are always opportunities of one kind and another which a young man, in an independent position, could take of earning a little money while his plantation comes into bearing. This would apply especially to cocoanut planting which requires but little supervision—and if along with the cocoanut a nursery plantation of Pará rubber is laid down, the planter would find himself in a position to offer Pará seed and plants to a new India Rubber Company and secure some profit to himself. At the moment there is a possibility of a Ramie Company and a Pará Rubber Company wanting managers and any good man, on the spot, would stand a chance of employment.

EXPERIMENTAL GARDENS AND ECONOMIC PRODUCTS.

The *I. P. G.* says:—If we may judge by present day journals which are recognised as representing planting and general agri-arbori-horticultural pursuits in India, we must come to the conclusion that the followers of these industries in Assam take the very front rank as experimenters with possible economic products suitable for their province. Surprise has often been expressed why a well-regulated experimental garden has not been inaugurated many years ago in order to test the multitude of possible products which, undoubtedly, in a great many cases, would be found to be sound investments when their cultural requirements were thoroughly understood. We have our Agri-Horticultural Societies and our botanical gardens, as also our agricultural colleges, and occasionally we have a Deputy Commissioner or a subdivisional officer who may have a turn for agriculture and, perhaps, take a more than usual interest in things agricultural. Again, we have our Agricultural Ledger as well as our Director of Land Records and Agriculture and attached staff. All these are working for the same end; but, when all is said and done, we are of opinion that a planter's *own* experimental garden during five years would do more practical good to their industry than twenty years of all the others we have mentioned, put together. We have no wish to decry any institution which exists, having the object of the improvement and further advancing the knowledge of agri-horticultural industries of the country; but what we do say is that Assam ought to have at least two experimental gardens of its own—one in upper Assam and another in either Cachar or Sylhet. The expense of keeping up such gardens would be trifling to a great industry, while the benefits accruing would be incalculable.

We have our individual experimenters, which we have not already mentioned above; but, although all honour is due to them, we must remember that all experiments undertaken by individual planters are speculative. If their experiment proves that any particular product is suitable for any particular district, or by modifying the treatment which is necessary in one part of the country find that, under altered conditions, it will prove successful in another part of the country, then the planter has a chance of being remunerated for his outlay on his experiment. But he cannot patent what he has gained in practical knowledge by risking his capital and spending his time, besides the wear and tear bodily and mentally which he has undergone; and in the end every one is benefited at his expense. On the other hand if his experiment is only successful to the extent of conclusively proving that the product under test is not suitable, then he must bear all the expense himself, besides the ignominy of defeat, and the only gain he has is the hard-won bitter experience—an experience from which every one derives a benefit at no expense whatever, but still will not prevent them learnedly wagging their heads and telling each other that they "always thought so."

It has been suggested to us that in the absence of such experimental gardens, we should devote a page of our journal to the discussion of probable economic products for Assam, either as a staple industry or as an auxiliary to tea. That the number of such possible products of the vegetable kingdom is practically inexhaustible, all men who have given the subject attention freely admit. We are well aware that a great many experiments have been carried on of late years, the results of which would certainly prove interesting and useful to the planting community. Perhaps some time in the near future the tea planters of Assam may see their way clear to combine and have an experimental garden of their own, when we would only be too glad to co-operate and render such assistance as lay in our power. In the meantime, we would cordially invite the views of planters upon any product they may have given attention to, with the view of having a regular "Assam Economic Product Discussion Page."

INDIAN TEA IN 1898.

The trade reviews of tea at this season of the year are always interesting. The planter may be able to profit by the opinion held by those who handle tea. In its review of Indian tea during 1898, the *Grocer* says: "Indian teas now hold the premier position for home consumption as regards usefulness from a trade point of view, and the year of 1898 has been a record one, deliveries showing the most marvellous jump upward in one year. Ever since 1881 Indian and Ceylon teas have been increasing in consumption, but the latter has always shown the bigger increase, as the public liked their flavour so much; about 1894 and 1895 Indian teas were either stationary or even going out of favour, but in 1896 they took a sudden large jump upwards, and this year the increase in deliveries is about '10½ million lb.' The reason is not difficult to find, we think. The prices of Indian teas has been abnormally cheap throughout the year, and they are preferred by the blender, as they are stronger and keep so much better than Ceylon teas; again several large distributers are advertising a very low-priced canister which India has been called upon to fill, as Ceylon leaf was too dear this blend must, however, be sold at a loss in order, no doubt, to catch orders on the better blends. The competition that is now going on between a few of the large blenders and packet houses and the big wholesale dealers is very keen—to the benefit of the grocer—while the public ought to be very well served, as blending is now quite a fine art, and is carried out in huge quantities on the most economical lines. The season of 1897-98 weighed out here at 135 million lb. against 131 in 1896-97, but the official figures from Calcutta called it 134 million lb., against 131½ million lb. We began 1898 with a stock of 61,700,000lb., or 7½ million lb. more than 1897, and for the first three months of the year we were overweighted with tea at auction, with no increase in deliveries; then the tide turned, and ever since March the deliveries have increased 1 million lb. or more each month. The present crop of 1898-99 is confidently expected to be 135 million lb., or only 1 million lb. more than last season, and we have already received 4 million lb. more of the present crop than last year. The position therefore for 1899 is very strong—stocks reduced some 4 million lb. compared with January 1, 1898, less tea to arrive, and very low prices for teas up to 10d of which the bulk of the consumption consists, and it certainly looks as if buyers would do well in buying freely at present rates. It must be remembered that the increase in deliveries is not all for home consumption, as the re-exports of 7½ million lb. show an increase of over 2 million lb. as compared to1897."

"The beginning of 1898 opened with heavy sales and very bad prices, sweet Pekoe Souchongs and poor Pekoes selling at 5½d. to 5¾d, while really good and fine Pekoes and broken Pekoes showed a heavy drop from 6½d. to 11d. Broken Pekoes were also at recent prices from 8d. to 1s. By the middle of February, however, a reaction set in for all good liquoring teas from 6½d upwards, as they were fully appreciated by the retailers, and from March onward prices imperceptibly improved, and by June many of the good and tippy teas had risen 2d. to 3d. per lb. Poor teas and the lower grades did not participate in the rise, and capital value was procurable at lowest rates from 5d. to 6½d. the latter price representing stylish

PRICE LIST OF MANURES.

Including Cost, Freight, and Insurance (f.p.a.) per ton, packed in double bags.

Prices firm to 9th February 1899. (Subject to such contingencies as war, fire, strikes and the like.)	Minimum Lots.	To Madras.			To Mangalore, Calicut, or Tellicherry.			To Tuticorin.		
		£.	s.	d.	£.	s.	d.	£.	s.	d.
THOMAS' PHOSPHATE POWDER, (Basic slag) 37 to 42 per cent.; phosphate of lime 80 to 90 „ „ fine meal.	10 tons.	3	12	6	3	17	6	4	1	3
SUPERPHOSPHATE, about 39½ per cent. soluble phosphate of lime.	10 tons.	5	5	0	5	10	0	5	13	9
SULPHATE OF POTASH, minimum 90 per cent. Potash salts; per 90 %, above that in proportion.	5 tons.	11	0	0	11	5	0	11	8	9
MURIATE OF POTASH, minimum 80 per cent. potash salts; per 80 %, above that in proportion.	5 tons.	10	0	0	10	5	0	10	8	9
KAINIT, 23 per cent.	10 tons.	3	15	0	4	0	0	4	3	9
Last prices per Mail **(without engagement.)**										
NITRATE OF SODA, 95 per cent. purity	5 tons.	9	17	6	10	2	6	10	6	3
SULPHATE OF AMMONIA, 24½ per cent. purity ...	5 tons.	12	5	0	12	10	0	12	13	9

All manures are of the best quality, and analyses guaranteed.

Any other Descriptions quoted on application.

Tools, Liquor, Stores, and all Planters' requisites purchased on a commission of 5%.

Analyses of samples of soils (with advice as to manuring) by Chemists of the highest repute undertaken. Net charge £3-7-6 per sample, or £11 for 4 samples.

"THE PLANTER,"

NEW AND ENLARGED SERIES.

This is a WEEKLY JOURNAL conducted with a special view to the interests of Planters. It contains Leading Articles by Experts: After-edits upon Topics of General Interest to Estate Managers and Assistants:—

Editorial Echoes,	**Letters to the Editor,**
District Correspondence,	**Market Reports,**
Companies' Reports,	**Scraps from Home,**
London Tea Letter,	**Tea Sales,**
Indigo & Coffee Notes,	**Ladies Column,**

and rates showing the Position and Returns of Calcutta and London Tea Companies.

"THE PLANTER"

is an excellent medium for Mofussil Advertisements: its circulation is among a special class of buyers.

ORDERS BOOKED FOR

BEGG'S PATENT TEA ROLLING MACHINE £95.

PACKING AND SHIPPING £3-10.

THIS machine has been in use for some years past on private estates in Assam, and the excellence of the tea manufactured thereby is proved by the good prices obtained, and the reports characterise the teas as being "good *tippy* teas, with strong pungent liquor, and well-twisted leaf."

The roller adapts itself to any class of leaf, and can be used, if desired, as an open top machine, or pressure can be applied as lightly or heavily as necessity may arise by means of a simple mechanical arrangement. The twist in the leaf is obtained to a degree of nicety without balling, no breakage occurs, and is kept cool throughout. The tips are not blackened by the oxidation of the juice from the leaf.

The low price of the machine will allow planters to obtain an excellent leaf roller at a very moderate figure, and thus be enabled to supplement their rolling plant, which in so many cases is insufficient.

The machine is very easily driven, absorbing about 1½ h.p. only when fully charged. The mechanism is exceedingly simple, and nothing can get out of order. All parts are made of the best material, and good workmanship guaranteed. It will take 300 lbs. of withered leaf at a time, and is easily and rapidly filled and emptied.

TILESTONITE.

A new covering for corrugated iron roofs and walls.

Invaluable as a Heat-, Fire-, and Water-proof covering for Withering-Houses, Fermenting Rooms, Offices, &c.

Makes a clean, fireproof floor for an upper sorting or withering department.

Further Particulars on application to the India Trading Co., Ld., Madras.

Pekoes but with poor liquors. In April two large houses operated heavily, and by the end of the month prices were raised ½d to ¾d. per lb. on teas for price. A slight reaction set in after this operation was over, and trade became quiet for the rest of the season, but all good teas rose owing to their scarcity. On June 6 a few hundred packages new season's arrived and brought satisfactory prices. quality being considered fair average. Some of the Assams and Darjeelings arriving in August and September were very fine and brought extreme rates, but the bulk of the new crop is only fair and wanting in point and strength. A large business was put through right up to the end of the year, but prices have kept low for Pekoe Souchongs at 5¼d. to 5¾d. and Pekoes with style from 6½d to 9½d. have hardly ever been cheaper, as the weight of the supplies have consisted in teas between 6d. and 10d. In the autumn any common tea was eagerly taken at 5d., and the market was very strong, although cheap, for leaf teas up to 5½d. The strain on the buying powers of the trade proved too great towards the end of November, and price tea eased off ¼d. per lb. Quality fell of in the autumn in the better teas, which reduced the bulk of the supplies to all one range of price; hence dealers have had it all their own way in stylish Pekoes from 6d. to 9½d., but as the year closes, spotty teas that stand out, although intrinsically worth only ½d. to 1d. more than the 9d. to 10d grades, will yet bring fancy prices as buyers are so eager to secure them Finest teas are also very scarce and command full rates. It must be noted that Bombay and America have taken some 3 million lb more from Calcutta direct this season. The total imports for the year 1898 will be about 5 million lb more in 1897. or say 139½ million lb., against 134,855,000, while the deliveries will be nearly 138 million lb. against 127,350,000 in 1897."

TEA IN 1898.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon, and Java Tea Report for 1898, dated December 30th, 1898, says:—"The Tea producing industry has been passing through a severe crisis. The worst of the depression appears now to be over, and there are decided indications of a brighter outlook.

For some years past cultivation has been rapidly increasing, both in India and Ceylon, necessitating constant reduction in price, which gradually receded, until during 1898 the lowest average prices ever recorded were reached.

The cost of production in the meantime was greatly augmented —first by the enhanced price of rice owing to the Indian famine, and secondly by the artificial rise in the value of the rupee, so that the margin of profit was thus still further reduced. Home Consumption during last winter showed a marked falling off, probably due to the increased use of Cocoa as well as ,to the strike in the Engineering trade. Whatever the cause—the result was the consumption of less Tea, and consequent accumulation of stock with reduced prices.

But a marked change has come over the position. Home Consumption has again increased and is now greater than ever, some six million pounds more of British Grown Tea being used during 1898 than in 1897, while the total supply to the United Kingdom appears likely to be little, if at all, above that of last season.

It will thus be seen that the statistical position of Indian and Ceylon Tea in this country is remarkably strong, and there appears little doubt that an advance in price must take place, especially in Indian Tea, which at present is relatively cheaper than Ceylon.

Another feature is now to be taken into consideration. For years past efforts have been made by Indian and Ceylon Planters to foster a taste for their Teas in new markets, the result being that whereas in 1890 only 14 million lbs. of British Grown Tea were used outside the United Kingdom, the quantity had risen in 1897 to 51 millions lbs. For the first 11 months of 1898 there was an increase of 9 million lbs over the corresponding period of 1897.

This, added to the increased use of British Grown Tea at home, makes an excess of some 15 million lbs. against a probable increase, according to the official estimates, of only 9 million lbs. in the united crops from India and Ceylon. Hence consumption has apparently at last equalled production, while the continual expansion of these outside markets gives every confidence to the belief that the ratio of increase will be more than maintained.

Should this be the case, the resulting competition would probably occasion some advance in quotations, and a condition of the industry more favourable to producers. It is, however, most important to remember that the present more cheerful outlook has been caused by increasing consumption, coupled with a check in production. Any sudden opening out of new Tea areas would therefore only cause a recurrence of the late depression. Planters should rather aim for less quantity with improved quality.

Indian.—The official estimate of the total crop is 154,000,000 lbs. against an outturn of 148,000,000 lbs last season. The quality has not been up to that of 1897. Assam was a fair average, while some of the Teas from Darjeeling showed improved flavour. Dooars Tea has been much the same as last year, but Cachar and Sylhet suffered so severely from the weather that both output and quality were poor. The average price for all Teas sold on Garden account in 1898 was 8 30d., 1897, 9d., and in 1896, 8¼d. The average from the commencement of the season to the end of the year 8·44d. 1898, 8·94d. 1897, 9 13d. 1896.

Ceylon.—The crop has been a very fair one and fully up to the average in quality, although some disappointment is generally expressed by growers in reference to the quantity. which has fallen somewhat short of their expectations, the latest estimate being placed at 119,000,000 lbs. against an outturn of 116,000,000 lbs. in 1897. The average price for the year 1898 was very little below that of 1897, viz.: 7·76d. against 7·82d., and in 1896, 8·21d.

New Markets continue to make satisfactory progress. Australia, the largest consumer of British Grown Tea outside the United Kingdom, has gradually increased her use of our Teas until they now supply about 65% of her total consumption. The North American market continues to make progress sufficient to justify the work of the Indian and Ceylon Commissioners, while the fact that direct steamers now leave Calcutta and Ceylon for New York, sailing under the American flag, is apparently having a beneficial effect upon the use of our Teas in the United States. Russia has become a very important consumer of Ceylon Tea, and now that the Russian Volunteer Fleet is able to take supplies direct from Colombo to South Russia, a remarkably rapid increase has taken place in shipments. which appear capable of a most important development.

Exchange.—The average rate of Exchange during 1898 was 1/4 3/16 against 1/3 15/32 in 1897, and 1/2 13/32 1896."

THE FERTILITY OF THE SOIL.

It now seems safe to formulate a few general principles as being sufficiently established to justify building upon them a scheme of horticultural management:—

1. The carbon of green-leaved plants is absorbed directly and practically exclusively from the atmosphere, through the medium of the foliage. At least, the soil supply of carbon is a matter of minor importance.

2. The oxygen of such plants is chiefly absorbed in like manner by the foliage or taken up by the roots in combination with hydrogen in the form of water; although a minor and comparatively unimportant source of oxygen and hydrogen may be found in the breaking up of nitrates and ammonia by nitrification.

3. The nitrogen of such plants is obtained invariably from the soil either directly from compounds of nitrogen with oxygen, hydrogen, or mineral or organic compounds—such as nitric acid ammonia, nitrates and humus; or indirectly through symbiotic growth of micro-organisms living in the soil, which have the power of assimilating the free nitrogen of the atmosphere; this symbiotic growth being apparently confined almost altogether to leguminous plants

4. The mineral constituents of such plants are taken directly from the soil, being absorbed by the roots in the form of solution in water.

5. The ten or more mineral elements found in the ashes of plants are furnished in abundance by practically all fertile soils provided there be present a sufficient quantity of available phosphoric acid and potash, and sometimes also of lime.

6. The various elementary substances found in plants are combined with each other in certain definite proportions, varying for different species, but held within very narrow limits for each species; and the growth of the plant is measured and limited by the least amount of the various elements required for their growth.

Reducing these principles to the lowest terms, and stating them in general form, we may say that the plant will secure a full supply of carbon provided other nutrients are furnished; that the supply

of oxygen and hydrogen is chiefly dependent upon the water supply; that the supply of nitrogen may be regulated by the use of mineral nitrates of ammonia-salts, or the setting up in the soil of those conditions which favour the growth of nitrogen-working micro-orginisms; and that having provided a full nitrogen supply, we may controll the growth of the plants by giving or withholding phosphoric acid and potash.

7. The water-supply of plants is a matter of supreme importance, for not only does water comprise three-fourths or more of the actual weight of cultivated plants when growing, but it is the vehicle in which all the mineral and nitrogenous constituents of plant-food are carried to their destination. In performance of this function it is constantly passing through the plant, being absorbed by the roots and transpired by the foliage; it being estimated that more than 300 pounds of water must pass through the tissues for the deposition of a single pound of dry substance in the plant, and thus the question of the maintenance of the water-supply becomes one which cannot be neglected in the garden.

The nitrogen supply takes rank next to water in importance, for it is the ingredient which may be most quickly exhausted by an improvident system of horticulture, and which is the most expensive to replace by artical methods.

When it is considered that the plant-food in the soil must be of very slow solubility, in order that it may not at once be washed away by heavy rains and artificial waterings, and when we reflect upon the observed fact that when we apply certain forms of soluble plant-food, such as superhosphate for instance, a large portion of it is immediately converted into an insoluble or very slowly soluble condition by reactions within the soil, it is absurd to expect to realize in the growth of a single season, or even in that of many seasons, the entire quantity of plant-food applied in manure.

But accepting the fact, which seems to be demonstrated beyond question, that the entire amount of plant-food applied in a fertiliser will not be returned in one crop, the question arises, especially in view of the light which recent discoveries have thrown upon the methods by which the inert nitrogen of the soil is converted into assimilable form through the agency of nitrifying organisms and upon the still more interesting problem of the assimilation of free nitrogen through the agency of symbiotic growth, whether we may not hope to be able to modify existing systems, and obtain the object in view more quickly and efficiently.—J. J. WILLIS, Harpenden,—in the *Gardeners' Chronicle.*

THE RESUSCITATION OF WRECKED TEA.

A METHOD OF REJUVENESCENCE.

"SECATUR INDICUS" contributes to the *Planter* a paper from which we take the following excerpts:—A method which shall renew root and branch, and bring into existence what was never in existence before, this, I think, must be the remedy for a thing that wont work—a renewal of the working parts—, and *per contra* the speedy and absolute destruction of the old; so that eventually and for all practical purposes there shall be erected on the old a vigorous and living new plant.

The method:—Open out the stem or collar of the plant for a depth of nine inches to a foot below the surface. so that so much of the buried stem appears to clear view. I would now suggest that well-defined strips of bark be taken off at intervals; the aggregate not to exceed half the circumference of the stems at the bases. The strips might conveniently take the form of a wedge, the horizontal cut to be from half to an inch wide according to size and character of the plants operated on, and then from the cross cut descending into an acute angle four to six inches long down the stems. The following is suggested as an expeditious way of accomplishing the

ROYAL EMPORIUM,

BANGALORE.

GENTLEMEN'S DEPARTMENTS.

Tailoring. Under the control of a European Cutter. A splendid range of Patterns in Tweeds and Flannels. Samples on application. Prices extremely moderate.

Outfitting. A complete stock of Collars (all the latest shapes), Ties, (a handsome selection) Hats, Caps, Evening gloves, &c., &c., &c.

Boots and Shoes. Best value in India. Prices to suit every purse.

Pipes. A large assortment of Briar, Meerschaum and Cherry. A complete price list on application.

Stationery. Our prices are the cheapest in Southern India. A complete variety to suit all fancies.

Games. Everything for Tennis, Golf, Cricket and Football.

Miscellaneous. Walking sticks, Umbrellas, Travelling Requisites. Everything for Household use.

Trial Order Solicited from those Planters who have not yet patronized us. Upcountry Orders receive personal Attention of the Manager.

Agents for LEA & PERRINS' WORCESTERSHIRE SAUCE.

CELEBRATED OILMAN'S STORES.

work accurately. The first man or men should be armed with some lamp black mixture and a strong string, and ring the plants with a black mark one inch below soil level.

Secondly, it would be a simple matter to have pattern markers of the cuts to be made. Accordingly it would be the duty of another man or men to mark off the cuts from the aforesaid ring vertically downwards. Thirdly would come the barkers, with instructions to take out the strips enclosed by the markers; and the best way to do this would be by taking the sides to right and left descending from the surface ring, then the short cross out, from whence the pieces would be conveniently taken out. Fourthly, another set of men would follow the barkers for filling in peremptory orders, and strict attention should be given to the fillers, namely. to thoroughly pulverize the soil and fill in with fine soil all around the cut outs in particular. I do not think new soil would be necessary; although undoubtedly virgin jungle soil for filling in immediately around the stems would be an advantage not to be overrated. * * *

When to Carry out the Operation.

I suggest wherever practical, the advent of the monsoon season or some period during the active circulation of the sap. On the other hand, it should not be when the soil is saturated, and therefore, not in a good friable condition for filling in. This period of sap circulation would greatly facilitate the taking out of the strips of bark, and moreover would, I believe, facilitate rapid formation of roots and shoots. There might possibly be some slight loss of sap, but this in reality would be an advantage, and be so much food deposited for the ensuing roots, at the expense of the old ones; and I dare say in part of the leaf, if it was the flushing season. * * *

What it is Calculated to Accomplish.

This method is calculated to accomplish two things, first the production of new roots; secondly, the production of new shoots; but, in order to produce the latter, care must be taken that the upper cross cuts are not buried too deeply, otherwise there is a liability of root production only. Probably half to an inch of fine soil will be ample, the former for preference. And if the plants do not give a natural soil line mark, one should be made, in order to accurately guage the filling in, and so regulate the depth of soil above the cross cuts. Now, pending the production of new roots, and shoots, it will be perceived the planter need not necessarily loose anything; he may pluck and prune as heretofore Nature alone can do the rest in the production of new growth and roots. * * * I am unable to state what would be the precise effects of a cut down on the artificially taken out pieces of bark recommended, as against leaving the plants alone. This, however, is a question that can be easily put to the proof, and I would strongly recommend planters to test with, say only a couple of plants, bark as recommended with two plants, cut down one and leave the other. There is however, this weighty consideration that cutting down means an end of tea making for the time being. On the whole, and speaking purely theoretically so far, I am inclined to believe the weight of advantage lays with non-cutdown plants in which the circulation of sap remains active and in full force.

Subsequent Treatment.

Presuming then the plants were not cut down, I infer the loss to the planter should not at any time exceed twenty-five per cent. if so much. By the second season after barking, there should be liberal formation of roots and branches or shoots in progress, and these, needless to say, should receive every encouragement, and have ample space for development—the object being an eventual meeting of all new growth and the total suppression of the old. Consequently in practice there would be but little pruning during the development of the new growth, but a system of absolute thinning of all old growth that interfered with the new, until finally the old plant disappears altogether. But no doubt in practice there would be some variation, and the new growth of some plants might not meet, in which case nothing would be simpler than to cut down the centre of the old plants and allow a development central—from that source. Other irregularities in a method of this kind would be also certain to ensue to a more or less degree—such as strong and weak shoots, but the planter would set before him an ideal—a model—and work for that model. The strong shoots should be allowed full swing for a time, when they should be incised to the extent of half the circumference of the shoot; this would allow the smaller shoots to pull up: moreover the larger ones might be finely plucked, taking great care to lay out for a standard prune later on when all shoots had arrived at a good standard height I would, therefore, recommend that the first plucking from the strong shoots be as previously mentioned—fine from all reasonably long shoots, and subsequently light pruning until the weaker shoots had pulled up and bean given time to become strong, when a standard prune might be made with great advantage and a uniform surface arrived at. Some variations might quite likely be on this wise—namely, extra strong one sided shoots, in which case it will be well to consider whether such a shoot of itself would not make a very good plant if it had full play; in which case the whole of the rest might be cut clean away, and the strong shoot headed back to induce it to make the maximum of lateral growth. This often happens with other things that differ nothing from tea in the matter of formation and pruning, and the success of a clean cut away in favour of an exceptionally vigorous well-placed shoot is perfect and unquestionable. Secondly, it will happen there is ample of other uniformly good medium shoots to form a very good plant: in that case the strong shoot itself should be removed in favour of the remainder, the two together are not compatible with a well-balanced plant. The aim in all cases should be a well-balanced plant; yet again there will in some cases be an excess of shoots; these should not be tolerated, but the superfluous taken away. A superfluity of shoots will almost certainly later on produce a closely massed thicket of growth that will speedily collapse under plucking, and defeat the object in view, namely a given number of well-placed shoot that will speedily monopolize the first three feet of soil.

Pruning of Rejuvenated Plants.

In this method the planter plays for a time a distinctly waiting, regulating part, until that time when a prune can take place and the full period of plucking ensues. Here I am constrained to say it will pay the planter to remember his former plants were brought to an unprofitable stage, not by reason of his alleged exhausted soil—the rejuvenated plants will teach a valuable lesson on this head—but solely, as I contend, by a killing system of pruning, possibly aided by a destructive system of close plucking. In the premature collapse of tea I am wholly unable to see a single factor outside pruning and plucking. * * * By a constant renewal of growth involved in judicious thinning a healthy tea plant, I am convinced, would show no signs of exhaustion until real old age set in; neither would the plants at any time be choked up with bundles of useless wood. And if, as previously suggested, the first spring flush was picked fine from all reasonably long shoots, the annual prune would be through clean bright wood, of good texture and medium size, abounding with good buds. And in this way there would annually disappear the multitude of divisions of shoots brought about by a full season's plucking; and so there would be throughout the bush, by good pruning and thinning, a constant renewal of healthy vigorous growth, a first class root action in consequence, good flushing, and, unless I am very much mistaken, a superior and much more uniform sample of leaf and consequently tea manufactured; and I make no doubt, a greatly added period of utility for the plants so treated.

PRODUCE AND PLANTING.

Tea Prospects.—The outlook for tea is brighter, and in calling attention to this Messrs. Gow, Wilson, and Stanton in their circular published in our last week's issue drew attention to the importance of remembering that the present more cheerful outlook has been caused by increasing consumption, coupled with a check in production. "Any sudden opening out of new tea areas would therefore only cause a recurrence of the late depression." Consumption has out-stripped production, but there must be no headlong folly in the form of further extensions, or the last state will be the worst. Unfortunately there is no law against rashly conceived tea planting operations, and a brighter outlook is tempting.

Driving it Home.—Emphasising the same point, the *Financial Times*, in an article on "The Indian Tea Companies in 1898," says: "For the time being it would seem that the demand has overtaken the consumption, which has not been the case for many years, and as there is good reason to believe that the markets abroad will continue to expand, unless the price of the commodity rises considerably, the prospect for the producing industry is brighter than

it has appeared for some time past. The fact that direct steamers carrying the American flag now sail between Calcutta and Ceylon and New York ought to benefit the North American market, while the Russian ships which ply between Colombo and the Black Sea should stimulate consumption in the Czar's dominions. Much, however, must depend upon the producers themselves. If they refrain from opening up fresh gardens, and confine their energies rather to improving the quality of their products until the expansion of the markets really warrants an extension of the area under cultivation, then we may expect a renewed period of prosperity, but otherwise a recurrence of depression can scarcely be avoided. The better outlook has been brought about simply by an increase in consumption occurring concurrently with a check to production, and if the conditions be reversed the old situation will revive. Still, we may trust that planters have profited by the somewhat severe lesson of 1898. During the past twelve months there has been no flotation of new companies, though several of the older concerns have made fresh issues of capital. Another favourable point is brought out in the review of the share market by the Indian Tea Share Exchange. This is the expected abandonment in Cachar, in the Dooars, and elsewhere, both of the older and unprofitable gardens and also of the recently opened areas, which, if expectation be realised, must tend still further to check production. We must not hope for too much at once. The final dividends for the past year, as we have said, are not likely to be brilliant, and even if matters improve in the current period as regards the prices obtained for the product, yet the high level of the Indian exchange, no reduction in which can be counted on, must keep expenditure up, while several of the companies will probably find it prudent to make good their depleted reserve funds. Attention, however, is being directed to increased economy in some departments of working, which appears possible. With reference to the present season, the reports from Assam and Dooars are favourable, but in Cachar, Darjeeling, and Sylhet, the crops, which were effected by drought, are stated to be both short and of poor quality. All circumstances considered, holders of tea shares would probably be well advised not to realise in the present depressed condition of the market. An improvement in values may not come about in the near future, but the chances are that it will come sooner or later, and, at any rate, it is more likely to occur than any further serious fall in prices."

A Novel Competition.—The public mind in New South Wales, always sportive in its tendency, has lately been exercised over a match between a white workman and a Hindoo, over which much more than mere bets was at stake. Hindoo labourers, it appears, have been underbidding and ousting the whites in the sugar-cane fields in certain parts of northern New South Wales, and in particular in one neighbourhood rejoicing in the euphonious name of Immigrant Creek. The whites alleged that Hindoo cheap labour deserved the epithets applied to Chinese by Bret Harte's Truthful James. The Hindoos—and their employers—declared, on the other hand, that in the cane-fields, at any rate, the white worker was not the equal of the brown man. Moreover, they put forth a champion, and backed him to dig more cane holes in ten hours than any white in the country. The challenge was accepted, and we are told that the conditions were that both men should dig for ten hours without refreshment—a stipulation supposed to tell in favour of Asiatic abstinence. However, after India and Australia had toiled and sweated through the allotted day it was found that the Anglo-Saxon had dug 700 holes to his antagonist's 600. Trifling as this trial seems, it is likely to have more effect on the public imagination of the colonies than scores of speeches and pamphlets upon the ability of the white man to carry on the cultivation of sugar without the aid of coloured labour from the tropics.

Rubber Trees for Cultivation.—The rapid destruction of the rubber vines in Africa, and especially on the eastern coast, has long been deplored. Official action has been taken in the colonies of more than one European Power to check this destruction and prevent the deterioration of the rubber, and with some success. But with regard to South Madagascar, where no restriction exist, the natives recklessly cut down all the plants within their reach, even digging up the roots. It is estimated that within a few years, unless steps are taken to prevent it, this valuable rubber district will be completely exhausted. Little or no rubber comes from the Philippine Islands. Certain creepers found there have been reported to yield rubber, but this lacks confirmation. The rubber trees that offer the best inducements for being regularly cultivated in other than their native countries, arranged in the order of their value from a cultural point of view, are named by Dr. Morris in the lectures before the Society of Arts as follows: Hevea Brasiliensis (Pará rubber), Castilloa elastica (Central American rubber), Kickxia Africana (Lagos rubber), and Manihot Glaziovii (Ceará rubber). Exception must be taken to Dr. Morris's statistics of rubber production. By adding together the total rubber imports of Great Britain, France, Germany, the United States, &c., he derives a total annual production of 60,000 tons. But as each of these countries exports more or less rubber, and England a very large quantity, it is clear that by Dr. Morris's method a considerable quantity of rubber is counted more than once. By deducting from the total of imports by all countries the total of their exports, a figure would be obtained which doubtless would indicate more nearly the world's production.

The Price of Rubber.—The position of the rubber industry is one which is watched with special interest just now, for whilst the raw material tends to a still higher level of prices, particularly for the fine Pará variety, which is so necessary to the production of serviceable tires and other rubber goods, quotations for the manufactured articles have for some months past gone rather the reverse way, and seem likely to go still lower. It is only two or three years since the prized Brazilian and Venezuelan raw rubber styled "fine Pará" ruled at from 3s. to 3s. 3d. per pound, but by July last the quotation, which stood at the beginning of the year at 3s. 7d., was up to 4s. 5d. per pound, whilst the present price is about 4s. 1d. British manufacturers of mechanical rubbers have by agreement raised their minimum price-lists twice in the course of this year—10 per cent. in February, and a like amount in July last; but it is affirmed that this rise does not nearly cover the enhanced price of the raw material, labour, &c.

Another Planter's Paradise.—M. Lionel Decle has, in *The Fortnightly*, a very appreciative article on the Rhodesian schemes, and particularly on the Tanganika Railway project. The Tanganika Railway, according to M. Decle, will open new markets and carry to the south scores of thousands of "magnificent Wanyamwezi labourers," who are urgently needed there. It will cross regions

rich in minerals, admirably adapted to agriculture, and suitable to the cultivation of coffee, sugar, and tobacco. When it is built the trade from the East coast with the interior will become insignificant, and the cession of Zanzibar to Germany might be contemplated if an adequate exchange of advantage can be negotiated. M. Decle's account of some of the expected produce of the new territory is as follows: "The Zambesi Valley possesses a climate and soil suitable to sugar plantations; india rubber is already found in the Ro-Angwa Valley—I have had samples of it sold to me by the natives. Then we must not forget that tobacco is cultivated by the natives in every one of the districts which will be crossed by the railway, and the experiments carried out by Messrs. Buchanan Brothers in Nyassaland prove that tobacco of the best quality can be obtained from imported plants. Already, in 1893, I bought from these planters light-coloured tobacco almost as good as the Turkish tobacco sold in Europe, and they were beginning to make cigars equal to many of the Indian brands; this was only two years after they had made their first experiments from imported plants. I have, therefore, no doubt, and I must insist on the point, that Northern Rhodesia and British Central Africa will, with cheap transport, soon be able to compete with Sumatra, Manilla, and India as tobacco-producing centres. Neither must we forget to mention coffee; it has, as is well known, already given unhoped-for results in the Shiré Highlands, and the coffee which has been grown there for the last eight or ten years—not as an experiment, but on a large scale—has fetched the highest price in the London market. The climate, altitude, and soil of the plateau extending from Lake Nyassa to Lake Tanganika offer conditions similar to those found in the Shiré Highlands, and with the advent of the railway those now unutilised lands will soon be covered with coffee plantations."—*Home and Colonial Mail.*

MARKET REPORT.

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated January 6th, 1899, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	962,356 pkgs.	680,547 pkgs.	27,355 pkgs.
1897-1898.	958,917 „	709,432 „	25,751 „

31,852 pkgs. Indian
19,833 „ Ceylon
2,086 „ Java
} Total 53,771 packages were offered in public auction this week.

December clearances have added a substantial increase to the already satisfactory deliveries of Indian Tea. These now stand for the first seven months of the season at 9,700,000 lbs. above the corresponding period last year. The Calcutta official wire just to hand gives the increase in the season's exports to United Kingdom to the end of December as only one million pounds.

Indian. The market opened on Monday with a distinctly better tone. Bidding was strong especially for low priced and useful liquoring Teas, the former showing advances of ¼d. per lb., and the latter ½d. over prices ruling before the holidays. The official wire gives exports to U. K. for second half of December as 5,650,000 lbs. against 5,870,000 lbs., making total from the commencement of the season to the 31st Dec., 122,407,000 lbs. against 121,140,000 lbs. last year.

Ceylon. The opening sale showed a firm tendency with here and there a slight advance in quotations. The official wire gives exports to U. K. for Dec. as 8,500,000 lbs., against shipments of 9,500,000 lbs. in Dec., 1897, and estimates quantity for Jan. as 8¼ to 8¾ millions. Exports from 1st Jan. to 31st Dec., lbs. 96,000,000 against 99,750,000 in 1897. Av. for wk. 8·04d., ag. 8·30d. same period 1897.

Java. Prices were very strong for all descriptions, quotations frequently showing some advance.

Movements of Tea in London (in lbs.) during December from Tea Brokers' Association Figures.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 10th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Please note the change of address.

SOILS OF ARID REGIONS.

It is to be hoped that Dr. Voelcker's report gave the *coup de grâce* to the fallacy that the agricultural science of the West might and should be adopted intact by the East. We are glad to note that, in like manner, attempts to foist Eastern agricultural practices upon the West—the New World—have been met with representations as to the difference in the nature of soil and products of China or India and the United States. Among other points raised in this connection is one of very great interest as to the character of the soils of arid regions. During a session of the Californian State Fruit Growers' Convention, Professor E. W. Hilgard, of Berkeley, first defined as "arid" regions those where the rainfall is deficient or falls in only one season of the year; leaving the term "humid" regions to cover the remainder. He then commented on the fact that the oldest civilizations of the earth developed in the arid regions. India, Persia, Egypt, were mentioned as examples in the East; while in the West, as far as is known, the highest civilization was developed on the plateau of Mexico, in Chile, and in Peru—arid lands in every sense of the word, regions of deficient rainfall, with all its consequences. Naturally, the question suggests itself, was it by chance that these regions were selected? It does seem, as Profesosr Hilgard observed, that we ought to prefer to live where nature does the irrigation for us, and it appears rather an incomprehensible selection that these ancient nations have made Close investigation throws some light upon this, however: and light that is not without interest for modern agriculturists. In India there are, of course, humid as well as arid regions, so that our remarks

about either one or the other must not be read as applicable to the whole Continent. Professor HILGARD has resorted to analyses of soils for an explanation of the apparent puzzle he has observed; and the figures he gives show, for example, that on an average of 319 analyses, arid regions show 0·22 per cent. of potash, humid only 0·8 per cent. Lime shows a much larger advantage on the side of arid soils. As regards phosphoric acid, there is no material difference between the humid regions and the arid regions.

The difference noticeable with respect to potash is easily understood. The combinations of potash, the sulphate, muriate, and caustic, and carbonate of potash, the usual forms, are all soluble in water. In the humid regions, this potash is constantly being removed by the process of rain-water leaching the soil; but this is not the case in the arid regions. There the potash stays in the soil and enters into combinations, from which, however, it is readily liberated by plants. In the humid regions it is washed out. Further investigation in the States has shown that the drainage of the waters of the humid region contains no more than a trace of potash salts, while the waters of streams in the arid region "contain a very notable proportion of potash, as compared with other contents." The leaching process produces a similar effect upon lime, but in lesser degree. When there is a large rainfall, during the high temperature of summer, the lime is leached out of the soil; and in the land of the humid regions it is leached out to a greater extent than is potash, for the reason that it does not enter into combinations as readily as potash. In the humid regions the measure of the first productiveness of all virgin soils is the lime. In the Indian plains "virgin soil" is practically unknown, but a few investigations made in this country lend support to the conclusion of the Californian Professor. He lays great stress upon the fact that in days of no scientific investigation the older civilizations developed in arid regions. He points out that in Hungary, too, the arid region is occupied by gypsies, and that other people do not realise the value of this soil, which "is just as rich as can be, provided you can get rid of the surplus alkali." He proceeds entirely upon the argument that the three mineral substances that are of chief value in fertilizing are potash, lime, and phosphoric acid; and shows very clearly that in respect of the first two arid soils have a decided advantage over humid.

There is obviously scope for further inquiry on the lines here suggested, with special reference to Indian soils. Investigations of the kind pointed to would be incomplete unless accompanied by investigations as to the demands made upon the soil by the various plants grown upon it. Modern scientists recognize that plant-life not merely draws certain properties out of a soil, but brings about certain chemical changes therein, to which due attention must be given when questions of rotation of crops, &c., are under consideration. The investigations that have been made in this direction in California offer no reliable guide for India; but what has been said about soils should certainly stimulate agricultural scientists' zeal, and induce similar investigation in India to that which has been made in California. The soil of Tanjore might, for example, be compared with the soil of Bellary; that of the Wynaad with that of Nellore. Or, better still, exhaustive analyses of the various soils of each District throughout India might be gradually undertaken; and the results reviewed by some such competent expert as DR. VOELCKER. Whether Professor HILGARD's conclusions were thus verified or falsified (so far as this might be done in a different country), the analyses could not fail to be of very great interest and utility.

INDIA RUBBER.

During 1898 a further advance in prices was established, averaging 6d. to 9d. per lb. on good and fine sorts, 3d. to 5d. on common. England, France, Russia, Germany and Italy have all increased their consumption. America has been less active till recently, owing to the large stocks of manufactured goods from previous years, but has been busier lately, especially the shoe trade. She took 1,600 tons less than at the same time in 1897 from Pará since 1st July. Messrs. S. Figgis & Co. state in their latest report:—"Deliveries everywhere having been so large the last three months, stocks are greatly reduced, and the receipts at Manaos and Pará being much smaller than expected for December—probably temporarily delayed—the visible supply is small, and quite exceptionally little is available for the current month compared with previous seasons at this period of the crop." This state of things is not likely to end just yet, for though various countries are now going in for rubber-cultivation it will take some time for supplies to come on to the market in appreciable quantities. Brazil is still the great source of supply and the governing factor as regards the market. The following further particulars given by Messrs. Figgis, may interest some of our readers. Owing to the death of the former largest receiver of Bolivian Rubber the supply in London has decreased, but that country has probably exported as much as formerly. Of Mollendo the supply increased and was improved. Matto-grosso sent us a fair supply nicely prepared, and it realized much higher prices. Peruvian has increased again; Iquitos shipping largely, some fair quality of fine and coarse entrefine but mostly ball and slab, which have realised higher prices closing 10d. dearer. From the Orinoco (Venezuela) supplies have been small and disappointing; it would sell well. Ceara has supplied more. A little Manicoba sold readily, but it is rather weak and soft. Pernambuco has been in good supply, and brought high prices. Mangabeira has largely increased, and some very nice parcels of good quality from Santos and Rio have sold well. Bahia, &c., has frequently been mixed with deadish and dirty rubber, and only sold slowly, but prices are about 4d. per lb. above those of 1897. Central American increased very much during the last three months, as less went then to America. Everything sold readily, and Colombian quality, much

improved, brought 10d. over prices of previous year ; also hard scrap and sheet from Ecuador, Tumaco, Guayaquil, &c. Central American, and rubber from the Cauca, Carthagena, Panama, &c., though much mixed, realized 4d. to 8d. advance. Of Nicaragua, Honduras, Guatemala and Mexican we have had irregular small supplies, which sold readily. Africa has increased her supply somewhat considerably as a whole though some sorts are reduced. Angola shows a large advance. The quality has been liked and very high priced obtained, closing about 8d. over 1897. The Congo still develops, the various descriptions have been of improved quality and very high prices generally paid—part being close up to fine Pará. East Coast African has about maintained the reduced supply of 1897.

From Madagascar imports have been greatly reduced, only 100 tons against 175 tons. The demand has been active, and prices are about 8d. to 9d. per lb. higher for pinky. Rangoon has fallen off in quantity considerably, but prices are 10d. per lb. higher. Penang has fluctuated a good deal owing to the rubber being mixed—good and fine quality sold dearer, but inferior pickings are much cheaper. Of Assam, small imports sold very quickly at 9d. to 10d. advance ; this description is much wanted. Borneo greatly increased, 600 tons against 350 tons, and prices generally were 2d. to 3d. higher, good quality particularly. Pontianac in less supply, and price advanced to £18 per ton, being £4 advance. Of Ceylon less, and very high prices paid, about 5d. above 1897 ; this quality in great demand, and planting and shipping clean rubber as hard as possible should pay well. Any quantity can be disposed of. Java sent a little more ; the fine red brought high prices ; white and barky sold readily, but only 3d. dearer. New Guinea.—Much liked, only about 20 tons sold at 6d. over prices of 1897.

PEPPER.

The opening of the New Year witnessed a boom in Pepper in London. Small supplies from Singapore and a determination on the part of shippers to hold off, gave prices an impetus, and even when $5\frac{7}{32}$d. January-March shipment for black Singapore was reached there was no great keenness to sell forward. This brought buyers round to Tellicherry sorts, then standing at $4\frac{11}{16}$d. c.i.f. delivered weight, Feb.-April. Prices rapidly rose, and probably about 400 tons were sold at about $4\frac{13}{16}$d. c.i.f. March-May. Then there was a bull, and buyers held off. Singapores advanced to $5\frac{1}{4}$d., however, partly no doubt, because of the smallness of crop estimate. The total yield is put at only 60,000 to 65,000 per cwts., out of which a good deal is already marketed or on the way. During the second week of the year Tellicherry black rose further. The *Commercial Record* of the 30th ultimo report a steady demand for this description ; 4 s. c.i.f. delivered weight having been paid for March-May, and 46s. 6d. c.i.f. delivered weight accepted for a parcel to Hamburg. Since then operators on the Havre terminal market have appeared as sellers at 46s. c.i.f. delivered weight, inviting orders a little under this figure, but no business, we are told, has resulted. It is estimated that Havre speculators placed about 400 tons Black Tellicherry in London, which with the sales of actual Pepper in London would bring the total sales of first hands up to close upon 1,000 tons of Black Tellicherry —a rather important item for an outside pepper. It is with some amount of satisfaction, says the *Record*, that we see our prediction as to the increased importance of Tellicherry Black being realised. With the falling off in supplies of Black Singapore, Black Tellicherry will gain in importance, for the vast consumption of the East not being able to satisfy its requirements of Pepper in Straits descriptions must fall back on Tellicherry, increasing thereby the value of the latter ; and once thoroughly established it will be difficult to oust it out of favour again, for its good quality will win many admirers. Havre has led the way, showing by establishing a terminal market for this Pepper that it is worthy of support, not only from a consumer's point of view, but also on the part of the speculative element. London, with the tenacity peculiar to a conservative trade, has clung to Black Singapore in spite of all the disappointments irregular supplies have caused, but like many other speculative commodities black Singapore will soon cease to offer sufficient scope for extensive operations. Years ago Cane Sugars, principally Jaggery, formed a favourite article for the speculative element to deal in, but Beet Sugar, although at first much discredited, has absolutely driven the West Indian sorts as speculative commodities out of the market, and unless the Straits see their way to increasing their supplies, their Pepper will, it is feared, share the fate of Cane Sugar. As time proceeds, Pepper will become of ever-increasiug importance to the spice trade, and operators will do well to keep a watchful eye on it.

INSECTICIDES AND MANURES.

While by no means disparaging insecticides, planters are, we believe, becoming more and more convinced of the truth of the saying that Prevention is better than Cure. They find certain insecticides very useful, but a judicious attention to cultivation does away with much of the necessity that would otherwise exist for the use of insecticides. The two are not rivals, but allies, and if both are used at the right times plants should be kept in a healthy condition. The Experiment Station Report of the New Jersey Agricultural College 1890, shows exactly how this matter ought to be regarded. It discusses the uses of certain insecticides. The arsenites are described as indispensable, lime also for certain purposes. Kerosine is said to be indispensable where scale insects are to be fought, or subterranean forms to be reached. Of these and a few others the report says : "These are all that are necessary, but not all that are desirable." It further states that the potash salts should be on every good farm for fertilizers, and that their use as insecticides adds nothing to a farmer's burden. Passing onwards to manures, &c., the report points out that besides the use of insecticides, methods of cultivation will do much to prevent or mitigate insect attack. Not the least of these is the use of manures or commercial fertilizers. Decaying vegetable or animal matter, it is remarked, should not be used on crops subject to root attacks—there is abundant room for its use elsewhere. Phosphates are not repellants, and insects have no particular objection to them. It is otherwise, however, with the nitrates and salts. These are decidedly disagreeable to insects, not in the sense of repellants, but because they are really effective insecticides in a limited range. The potash salts are, says the report under notice, by all odds the best for this purpose.

Of course, it does not follow that the above remarks should be accepted as infallible guides to tea and coffee planters. Men must experiment for themselves, and discover what their and and their plants need. If they rely on insecticides alone, they will probably learn a bitter lesson. If on the other hand they utilise insecticides prudently for curative purposes when there is occasion, and manures for preventive and recuperative, they should be able to make the most of the capabilities of their land.

BEE-KEEPING.

PRICES of Beeswax in the London market are fairly high, and the tendency during the next few months will probably be upward. Still, Indian supplies would appear to be all of a "wild" character, and bee-keeping as an occupation, not to speak of *trade*, would seem to be almost neglected. Yet it is a very pleasant occupation, and while to the negligent amateur it may be as expensive as playing with photography, to the careful man it is a miniature mine of wealth. It needs attention and a certain amount of scientific study. Honey is always a delicate product, and buyers are "nice" in their tastes. Sometimes the colour is too dark, sometimes too light, the consistency may be too thin or too firm. As a Queensland writer lately put it, "no matter how good the sample, the home buyer will discover such a host of imperfections in it that he considers 15*s.* to 16*s.* per cwt. a ruinous price for it." But it is not of the production of honey for the English market that we wish to write. There is demand enough for honey in India and the wax alone need be exported. Some people, as the same writer remarks, have the same idea as Eugene Secor's Dutchman, who sang—

Oh! I ish von of dose happy bee mans,
I don't got to vork any more.
I loats all day in the apple tree shade,
Or schmokes mine pipe at der door.

Now, those who are in the business know that to make a living out of the busy bee, a man must thoroughly understand the business, and must devote his whole time to it. The man who keeps three or four hives in his garden or orchard for the purpose of getting a little honey and wax for domestic use, and perhaps a little for sale is a different individual. His living does not depend on them, and if he neglects them he is at no serious loss. But where a living is desired to be made out of the bees alone, he must exercise but perseverance and patience. There are the usual thousand-and-one vexations and annoyances connected with this industry as with poultry-farming. We have written on this subject before, and do not now mean to go into general details. Our immediate purpose is to call readers' attention to the fact that in some places bee-keepers do not all run their apiaries for honey and wax combined, but some for wax alone. In reply to a correspondent, the journal of the Jamaica Agricultural Society says :—When the combs are out (in the supers) to the full size of the frames, cut them out, extract the honey, and melt the comb into wax. In cutting out the combs, leave about an inch of comb below the comb-guide at the top bar for the bees to begin on again, and repeat as above described as often as the combs are built. As soon as the honey flow is over, feed back to the bees all the extracted honey. More wax would be digested by the bees to build comb to contain the honey fed back, and again the combs could be cut out and melted. It would be a very interesting experiment to try with a few colonies how many pounds of wax one good colony could produce. In the next number of the same journal another writer recommends the following :—Select two hives (meaning two to work together—100 as 50, and so on) which we will call Nos. 1 and 2. Put a super with, of course, a sheet of excluder on No. 1. Then take combs (leaving one for queen) from No. 2 and put them in the super, filling the hive with frames having a strip of comb-foundation, or starter. Let the combs remain just long enough for the young bees to hatch Then take out the frames, cutting off the comb to within an inch of top bar. Remove the super to No. 2. Take out combs from No. 1 ; put them as before in the super, putting in the frames from which the comb was cut off in No. 1. As soon as the young bees are hatched, take out the frames and do as at first, removing the super alternately as above described, taking care to see that the bees are always fed back the honey taken from them (remembering it takes over 12 lb. of honey to make 1 lb. of wax), and for bees to be kept always making wax is a very great strain on their strength. The person in charge must watch and not leave any comb in the super directly the young are out, as it only wastes time.

PRIZE ESSAYS.

WE beg to remind our readers that a prize of Rupees one hundred will be awarded to the writer in any planting district in Southern India of the best essay on :—

THE LABOUR QUESTION.

THE PAST, PRESENT AND FUTURE SUPPLY OF LABOUR IN THE..... DISTRICT.

The following are the rules of the competition :—

1. Write on one side of the paper only.
2. Give your name in full, and state address (not for publication, except in the case of the winner).
3. Be as brief and concise as possible
4. Cite your authorities where possible.
5. Mark your MSS. "Prize Essay Competition."
6. Submit not later than 14th February, 1899 (in Madras).

It should be clearly noted that all essays sent in will be the absolute property of *Planting Opinion*, and that the proprietors will have the right to publish them, in full or abridged or revised, in *Planting Opinion* or elsewhere, and to republish in pamphlet or book form. No limit of length is fixed, but brevity is strongly urged, and diffuseness will greatly prejudice an essay's chance of being a prize-winner. Every competitor should strive to be *accurate* and *concise*. Rupees one hundred will be remitted to the winner immediately after publication of the prize essay.

NOTES.

Shade. In the State of Vera Cruz, Mexico, the banana plant is largely used as shade for coffee trees, and in the States of Tobasco and parts of Chiapas the same plant is also used as shade for cacao.

Tea Bulking. The Indian Tea Association has resolved to issue a Circular in March recommending tea bulking at factory wherever possible, and pointing out the great saving which would thus be effected.

Cacao. The lack of a continued humid warm atmosphere and the presence of cold at times checks the growth of cacao in the State nursery at Kamerunga, Queensland. Trees have flowered, but no fruit has formed.

A Boom that failed. A London contemporary has heard, that a boom in Ginger is being attempted by India, but remarks :—"owing to the dull and heavy state of our spot market, little attention has been paid so far to the doings of Indian bulls."

Vanilla. A Queensland report refers to Vanilla as hardly commendable except for experiment purposes, though it should thrive in the East end of British New Guinea. It suffers during the winter months of Queensland, and though the plants grown there look healthy not one has flowered.

The Auto-Sirocco Tea Dryer. It is stated that with one of Davidson's Auto-Sirocco Tea Dryers recently erected on Chetnole Estate, Ceylon, 500 lbs. of fully dried tea were turned out per hour, with an average fuel consumption of 1 lb. of wood to 2¾ lbs. of dried tea. This is a record for Ceylon in the way of tea drying, we understand.

The London Tea Market. Cabling to Colombo on the 26th ultimo, Messrs. Gow, Wilson, and Stanton reported a steady market, with the average of Ceylon, a farthing higher, *viz.* 8½*d*. Reuter stated that 20,000 packages were sold out of 21,000 offered. Of Indian Teas 43,000 were sold and of 45,000 offered, the average being again 9¼*d*.

Agricultural Chemistry. The handbook of Agricultural Chemistry for Indian students by Mr. S. H. Collens, F. I. C., Assistant Agricultural Chemist to the Government of India, has been issued from the Government Printing office, Calcutta. A large number of analyses are quoted, these being, with few exceptions, Indian. The book deals with the chemistry of the plant, the animal and the dairy, properties of soils, chemistry of soils and of manures, the supply of combined nitrogen, and water.

Coffee Leaf-disease in Zanzibar. Referring to a note we lately published on 'Coffee Leaf-disease in B. C. Africa,' a Ceylon writer observes :—"The writer makes one mistake. *Hemeleia vastatrix* appeared in Zanzibar first in 1895, and attacked coffee Arabica and Liberia with equal impartiality ; but the latter seemed to withstand it better."

Attar of Roses. We understand that a Madras firm is about to plant an acre or two of Wynaad land with Roses, with a view to the manufacture of Attar. It will be interesting to learn what process of preparation is to be adopted and to follow the progress of the enterprise. There should be a profitable future for it, if it is conducted prudently and energetically ; for the *Indian* demand must be very large, apart from the demand for export.

A Tea Map. Mr. George Seton, of London, has suggested that a great advantage to the tea industry would result from the publication of a map of the North-Eastern part of the Indian tea districts, viz., Assam, Darjiling, Duars, Sylhet, and Cachar, showing their relative position to one another,—the situation of gardens pertaining to all the London Tea Companies,—together with the principal towns, water and railway communications, as well as roads, etc.

Tinned ground Coffee. Mr. J. S. Sebastian, of the Blue Mountain Bakery, Ootacamund, has favored us with a sample of his tinned ground Coffee, which he informs us is made from the best Nilgiri coffee beans. We have tried it, and found it of an excellent flavour ; and there is no apparent reason why such coffee should not be widely purchased in place of the inferior beans usually available in the bazaars of large towns. Mr. Sebastian charges Re. 1-2 per tin, which seems to be a very reasonable price, as he guarantees the purity of the powder.

Colombo Tea Sales. On January 25th, about 10,368 packages equal to 858,922 lb. were offered, of which about 8,492 packages equal to 702,936 lb. were sold. The *Times of Ceylon* remarks :—"Owing, no doubt, to the scarcity of freight there was not so much demand at the sale, and medium and common brokens were a trifle lower, leaf teas were about previous rates, and the finest teas in the sale were : Middleton, Erlsemere, Mocha, Glasgow, and Agra Ouvah. Among low-grown teas good invoices were offered by Eila, Vogan, Palliagodde, Chesterford, and Knavesmire.

The British Tea Duty. At a meeting of the General Committee of the Indian Tea Association (Calcutta) on 9th ultimo, the Secretary was instructed to write to the London Secretary and state that the General Committee regretted the resolution which had the support of the London Association, and in view of the admitted necessity of reducing all charges they could not understand the position taken up. The abolition of duty (which amounted now to about 50 per cent. ad valorem) would save other heavy London charges in addition to the duty itself, and the General Committee hoped that the decision arrived at would be reconsidered.

Tea Statistics. It is scarcely surprising that the Indian Tea Association should have called in question the figures of increased area under tea, given by the Director-General of Statistics, but if the complaint be well founded, planters have only themselves to thank. It is they, and they alone, who can put the Director-General in a position to furnish the public with *accurate* statistics. It is extremely difficult to get anything of the kind in Southern India, and we fancy planters in the North are just about as reluctant as their

brethren in the South to give statistical information concerning their estates.

The San Jose Scale.

This pest, against which certain ladybirds have proved very effective, has obtained a secure foothold in central New England and is coming to be regarded as a very serious matter by leading fruit growers. Prof. C. H. Fernald, state entomologist of Mass, says that his correspondence in regard to the scale is greatly in excess of that concerning any other pest. The San José can only be distinguished from other scales by aid of the microscope. Its great destructiveness is owing to its power of producing several generations of insects in one season, while other scales bear only one generation and can be easily controlled. When an orchard is badly infested, about the only thorough remedy is to cut and burn it. This scale infests also some kinds of forest trees.

Coffee in Assam.

A correspondent of the *Planter* writes :—*Re* coffee in Assam I note the following from J. W. Master's Botanical Observations in Upper Assam :—"The coffee has been introduced within the past six or seven years and thrives remarkably well on ground sufficiently elevated to throw off superfluous water ; no coffee could succeed better in any country than a few trees that are growing in Captain Brodie's garden at Seebsagar ; they were seedlings obtained from the Botanic Garden in 1839." He then goes on to say : "I consider the elevation or slope of the land to be of more consequence than shade to coffee in Upper Assam ; suitable land could be found at Gabhru, Parbut, Cherideo and Deopani." It would be interesting at this time of day to know what transformations have taken place on the land that was suitable for coffee more than fifty years ago.

Tomatoes.

"Ignoramus" remarks in the *Times of Ceylon* that he tried tomatoes at an elevation of 2,500 feet. He says :—"I had excellent seed, and the young plants were quite healthy. They were transplanted at the right time to a well dug and manured bed, and seemed to flourish for awhile, but, before they fruit or come to perfection, they get a blighted withered appearance and singly wither and die for no reason that I can discover. On pulling them up, no poochies are to be found. They are in good deep soil, and some of the leaves were pruned when the stems were tied to pandals, to let in more sun. They are watered at the root. I see no reason for my failure, and shall be grateful for any help." The probability is that they were *over manured*, or that the manure used was too fresh. In a fairly rich soil little or no manure should be used for tomatoes, and only *well-seasoned* stuff.

Coffee in the United States.

A correspondent writes :—The deliveries of coffee are lighter than last year, but the figures are misleading, because so much coffee was taken out of licensed warehouses and placed in private warehouses in anticipation of a duty being placed on the article. All stock removed from licensed warehouses is counted as deliveries or consumption. There is some talk about the necessities of the Government being so great as to make it imperative that more revenue must be secured, and therefore a duty on coffee is again talked about. The deliveries of coffee for the past five months were 1,925,448 bags, against 2,164,706 bags for the corresponding time in 1897 and 1,969,759 bags for the same period in 1896. For the United States and Europe they were 5,099,540 bags against 5,591,204 bags in 1897 and 5,075,526 bags in 1896. The figures cover the first five months of the trade year beginning July 1.

Tea Prices.

As many planters think the middleman makes all the profit on Tea and is alone in benefitting by present low prices, we quote the following remarks from an annual review of the wholesale tea trade in Bristol :—There is, undoubtedly, no branch of the trade that is pushed with greater energy and determination than this one. Profits, it is asserted, have been reduced to such a low minimum that it is an exceedingly difficult matter to do more than obtain the smallest possible margin. It is a noticeable fact, and one which may to some extent corroborate this assertion, that comparatively few London houses seem desirous of catering for the North of Ireland trade ; those who have obtained a footing confine their operations invariably to the better-class purchasers who prepare their own blends. Perhaps, an additional factor for this may be found in the absence of practical experience in blending so as to secure the best results from the quality of the water, and at the same time suit the somewhat fastidious palates for which the Northerners are proverbial. The trade during 1898 has not differed very materially from that of the few preceding years.

Tea in the United States.

The following interesting note is by the American correspondent of the *Grocer* :—There has also been a falling off in the importation of tea. The imports and sources of supply are shown in the following official statement :—

Imports from—		Ten months ending Oct. 31 1897.	1898.
United Kingdom... ...	lbs.	4,379,634 ...	2,148,38
British North America ...	„	2,405,900 ...	1,367,79
China	„	38,423 763 ...	22,060,65
East Indies	„	1,775,471 ...	1.633,37
Japan	„	31,964,089 ...	26,384.20
Other countries, Asia and Oceania.	„	346.089 ...	283,67
Other countries	„	15,235 ...	8,97
Total...	lbs.	79,310,181 ...	53,887,06

Here is a falling off in ten months' imports of 25,423,119 lbs. It is also worthy of note that Japan furnishes 48 per cent. of the total supply ; China, about 41 per cent. There is apparently plenty of opportunity for Ceylon and India to displace Japan and China tea. It is certain that the demand for British-grown tea is on the increase ; and that the efforts of Messrs. Mackenzie and Blechynden, the Ceylon and India representatives of the planters, have been productive of large results, thatwill be more and more manifest as time rolls on.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton :—

61·50 lbs. Nitrogen.	14·92 lbs. Lime.
57·38 „ Potash.	13·68 „ Phosphoric Acid

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs. per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

The Currency Committee. We understand that Mr. Robert H. Elliott, of Mysore, is submitting a statement to the Indian Currency Committee. The *Times of Ceylon* remarks :—" Mr. R. H. Elliott, who owns extensive estate property in Mysore, and who with the Hon. Mrs. Elliott, has been staying in the island for some time, leaves by the " Rome" for Egypt, and will then go on to London. Mr. and Mrs. Elliott have been unfortunate in the matter of weather, as it has been wet most of the time they have been up-country, and they had to leave Nuwara Eliya on account of the rain—hence their departure for the drier climate of Egypt. Mr. Elliott is an authority on currency matters, his pamphlet in support of the producer's interests being well known He hoped to be allowed to give evidence before the Currency Commission now sitting in London, but he was put off on one excuse and another, and is now off to England to see if he cannot forward his views either before the Committee or by other means. A letter from Mr. Elliott on the abandonment of low-yielding tea will be found in another column."

The Russian Tea Trade. A French official report states that the Russians anticipate an extensive commerce in tea with China, when the Trans-Siberian Railway shall be opened. No doubt the new line will have great importance upon the transport of tea. The report referred to says :—" At present the importation of Chinese tea into Russia is effected by two different routes. One at Shanghai, where the tea is shipped for Odessa. By the second route, the tea is transported by caravan, as far as Kiakhtu on the Chinese frontier, and from thence across Siberia, to Moscow. Despite the long distance, and the expense that it involves, this old route which formerly absorbed all the trade to be had, still maintains a certain importance, notwithstanding the competition made to it by the maritime route, and its cheaper cost. That is due in part to the Russian tea-merchants, who quote as dearer the teas which have not undergone a long journey, and to another cause, that the teas of Kiakhtu are protected by established dues, so that on arriving in Moscow, the caravan teas are not sensibly higher in price, than those shipped from Shanghai to Odessa. Thanks to the opening of the new route Moscow-Oussousi, Amour, the teas will be able to be transported by sea to Vladivostock." [This will, however, entirely vitiate the claims of the teas to be regarded as " overland " tea]. " Protected besides, by the customs dues, which are levied at the Chinese frontier the teas will benefit by a notable economy, and this transport, effected by the care of Russian agents will present more security, than the actual transport by caravan. Not the less, Chinese tea is disappearing more and more from the European markets, to make way for the products from Ceylon, and India. Out of the 269 million pounds of tea imported into England in 1897, China only figures for 10½ per cent."

GENERAL ARTICLES.

ATTAR OF ROSES.

Apropos of an enterprise alluded to in our 'Notes,' we append a receipt for making the Attar of Roses, as it was prepared in India over a hundred years ago. There are more modern methods, to which we may make reference later.

" Take a very large glazed earthen or stone jar, or a large clean wooden cask; fill it with the leaves of the flowers of roses, very well picked, and freed from all seeds and stalks; pour on them as much pure spring water as will cover them, and set the vessel in the sun in the morning at sunrise, and let it stand till the evening, then take it into the house for the night; expose it in this manner for six or seven successive days, and at the end of the third or fourth day, a number of particles, of a fine yellow oily matter, will float on the surface, which, in two or three days more, will gather into a scum, which is the Otter of Roses. This is taken up by some cotton, tied to the end of a piece of stick, and squeezed with the finger and thumb into a small phial, which is immediately well stopped; and this is repeated for some successive evenings, or while any of this fine essential oil rises to the surface of the water."

PRODUCE AND PLANTING.

The Trans-Siberian Railway and Chinese Tea.—We know that in China and Russia it is expected that the Trans-Siberian Railway will give an impetus to the China tea trade. Writing on the commercial aspect of the railway a correspondent of the *Globe* says : " Among the many circumstances that will unquestionably conduce to give Russia an exceptionally advantageous position in the Chinese trade of the future is one that is deserving of special consideration. The Chinese tea trade has suffered immensely by the rapid development of the tea plantations in India and Ceylon. This decline has had the most serious consequences both for the Chinese themselves and also for the Government, Chinese tea being subjected to a very productive export duty. A revival of the Chinese tea trade, not only for consumption in the vast Russian markets, but also in those of other European countries, and passing through a purely Russian channel from the producers to the consumers, would, of course, give an immense impetus to the Chinese demand for Russian goods in exchange."

THE INDIAN TEA ASSOCIATION, LONDON.

The following is an abstract of the proceedings of a meeting of the Committee held on Tuesday, the 3rd instant.

Present: Mr. W. H. Verner (in the chair), Messrs. A. Bryans, G. W. Christison, R. Lyell, A. G. Stanton, C W. Wallace, T. Carritt and A. Thompson (of the firms of Messrs. Lloyd, Matheson, and Carritt and Messrs. W. J. and H. Thompson) were present by invitation

The Secretary read the notice convening the meeting.

The minutes of the last meeting, held on December 13, 1898, were read and confirmed.

Correspondence with Calcutta and New York, which had been previously circulated, was laid upon the table.

A letter from the Hon. Secretary London Wholesale Tea Dealers' Association, with circular as to fire insurance claims, was read, and it was resolved that a reply should be sent intimating that two members will be deputed to attend the Conference which it is proposed to hold at the end of this month to consider the question.

A letter from Mr. Robert Hart, dated January 3, was read, with reference to

The Conditions of Public Sale.—These were discussed at considerable length, and it was finally resolved that the questions raised should be postponed, with the view of taking the opinion of the Brokers' Association on the subject.

ERNEST TYE, *Secretary.*

ARTIFICIAL TEA.

IT goes without saying, observes the *Grocer*, that all our readers are eager to establish a reputation for the purity of the goods which they supply to the public, and many of them, we know, are very careful to examine all their products themselves, and not merely to trust to the verbal guarantees of commercial travellers, however much they are to be depended upon. When a man begins to take an interest in his business, apart from the acquisition of £ s d., it is surprising to what extent he may benefit himself, as well as those whom he supplies, by devoting a little time to the more scientific aspects of his goods; and we know that there are many amongst

our readers who are not only somewhat accomplished microscopists, but even are able to bring a considerable amount of chemical knowledge to bear. To such the fact that a new adulteration has been discovered for green tea will be interesting. It will be still more interesting, however, for them to know how they may, in a very simple way, detect any such adulteration. Messrs. J. Delaite and H. Lonay have recently reported in the *Bull-tin Assoc. Belge des Chim.*, **11** (1), pages **13-21,** upon a sample which was submitted to them. After examination it was found to contain 68 per cent. of extraneous leaves rolled into a globular shape. On steeping in water these unrolled less readily than the true tea. A bluish-gray powder separated from the leaves under water, and was found to contain manganese in addition to ordinary ash constituents, but no copper or lead. The microscopic examination of the powder led to the conclusion that earth and indigo had been used to imitate the colour of pure tea. In general form the extraneous leaves resembled *Thea chinensis*, but differed therefrom in microscopic character, as also from *Epilobium Vaccinium arctostaphyllos* and other known vegetable adulterants, and, in fact, could not be botanically indentified. The authors, however, consider that it is sufficient in practice for the chemist to detect the presence of extraneous adulterant leaves in tea, without specifying their nature.

STRAY NOTES ON MANURING.

MARL REDUCES LOSS OF NITROGEN—In an ordinary uncovered manure heap, the loss of nitrogen during 11 days in a German test was 37 per cent., in a covered heap it was a little bit less. The addition of 30 cent of marl to the manure reduced the loss of nitrogen more than 60 per cent.

* * * * *

COMPOSTING.—Mr. John M. Jamison, Ohio, writes:—"The whole strength of the argument in favor of composting may be summed up in the following statement. It enables the farmer to get the refuse products of the farm, such as straw, leaves and weeds and coarse manure, into an available form for plant food more quickly than could be done otherwise. It cannot be claimed that we haul from the compost heap more fertility than we put into it, hence if we can use these products without so much labor, we are the gainers. If not properly composted, much is lost which cannot be lost if these products are returned to the land in their coarse state. Following out this line of argument, the conclusion is that for staple farm crops composting does not pay. In the culture of garden crops and stock roots I find it desirable to have a supply of composted manure."

* * * * *

LEAF MOULD.—The experiments of the last twenty years in agricultural chemistry show conclusively how necessary it is that the manure employed should be suitable both to the soil used, and to the requirements of the plants we cultivate. Of all the various soils employed for horticultural and greenhouse purposes, the author considers the soil derived from decomposing leaves, humus, or leaf mould the most effective. The peculiar properties of leaf mould are, that it facilitates draining and æration, causing a quick and active plant growth, with a free development of root. The partial decomposing leaves and roots forming the mould require a free passage of air, to allow of the nitrification of the organic matter, and given this, the roots of the growing plants develop rapidly. The mould has also a large absorptive power: one hundred parts, by weight, of the mould will take up one hundred and ninety parts, by weight, of water. As it is known that the fertility of all soils is nearly connected with its powers of retaining plant food, several experiments have been tried of the retentive properties of leaf mould for different manurial substances, which have shown that it has a great absorbent power for potash and phosphoric acid, but that nitrate of soda is retained in a much less powerful manner. These facts agree with what has been found in ordinary agriculture. It is known that soils containing humus will absorb ammonia from the atmosphere, and thus increase their store of nitrogen. The organic remains of former crops or plants are also oxydised, the nitrogen being converted into nitric-acid.—M. GEORGES TRAFFAUT.

* * * * *

MANURES.—In reply to inquiry made by the Gumeracha Branch of the South Australian Bureau of Agriculture, Professor Lowrie wrote to the following effect:—

There can be little satisfaction in adhering to any definite formula in the use of manures; soils vary so much and are impoverished so variously according to the character of the cropping to which they have been submitted that the farmer must exercise his own judgment and read his fields carefully, to be guided both in regard to kinds and quantities of manure to apply.

* * * * *

WHEAT.—(*a*). Phosphatic manure alone, about 2 cwt. per acre. The chief phosphatic manures are bonedust, superphoshates (bone or mineral), basic slag, and phosphatic guano. (*b*). For land deficient in nitrogen: (1) 1½ cwt. to 1¾ cwt. super., and ½ cwt. to 1 cwt. sulphate of ammonia; (2) 2 cwt. basic slag and ½ cwt. to ¾ cwt. nitrate of soda; (3) 1½ cwt. to 2 cwt bonedust, and ½ cwt. to ¾ cwt. nitrate of soda or sulphate of ammonia Sour land may require quicklime, also light sand; apply this in dressings of 2 tons or thereabouts per acre. Occasionally light lands may also require potash, and the mixture might be some such as 1½ cwt. super. or bonedust, ½ cwt. to ¾ cwt. sulphate of ammonia, and 3 cwt. wood ashes or 1½ cwt. kainit Lighter of heavier dressings may be made according to condition of the land.

* * * * *

POTATOES.—(*a*). Wood ashes in abundance or kainit or sulphate of potash. Muriate of potash is said to cause waxy potatoes; (*b*) 4 cwt. to 5 cwt. wood ashes and 3 cwt. to 4 cwt. or more of super. or bonedust per acre (see note remixing ashes and super.); (*c*) 4 cwt. to 5 cwt. wood ashes with 3 cwt. bonedust and 1 cwt. of nitrate of soda—this is a substantial dressing for colonial practice, but light compared with practice in older countries; (*d*) farmyard manure, and plenty of it, invariably enhances the yield greatly, but is said to make potatoes scabby.

* * * * *

LUCERNE.—Bonedust in abundance—4 cwt. up to 10 cwt. according to crop yielded—applied annually at the time the lucerne is cultivated in the winter. Gypsum also is useful, as is quicklime in good heavy dressings occasionally, not in hundred weights but in tons; 2 tons is generally little enough.

* * * * *

SWEDES.—Superphosphate in abundance.

* * * * *

MANGOLDS.—Nitrogenous salts especially. A good dressing is: Farmyard manure, 8 tons to 10 tons per acre; 1½ cwt. bonedust or super; and 1 cwt. sulphate of ammonia or nitrate of soda, together with 2 cwt. to 3 cwt. common salt.

Incompatibles (*i.e.*, should not be mixed).—(*a*) Nitrate of soda and super.; (*b*) super. and quicklime; (*c*) basic slag and sulphate of ammonia; (*d*) lime and sulphate of ammonia; (*e*) wood ashes and super. should not be mixed long before application, and are better applied separately.

THE RUSSIAN MARKET.

THE KINDS OF TEA REQUIRED.

A few days ago we published in our columns a letter, signed "Russian Buyer," respecting the sale of Ceylon teas in the Russian market, and since then, with the object of obtaining information as to the grades of teas most in demand by the Russians, one of our representatives has made enquiries amongst well-known tea experts in Colombo. He ascertained that what was greatly wanted was for the tea for the Russian market to be obtained direct from Ceylon, and not only to thus save the cost of shipping it to London and then on to Russia, but also to obtain the additional advantage of having the tea "fresh," as during the journey to and from London the teas largely lose their flavour, and of course through this they appear to less advantage than otherwise would be the case. As Planters will have seen from the statistics issued by the Customs, and recently published by us, the amount of tea exported to Russia *via* Odessa has been rapidly increasing during the last six months, and we might also point out that tea shipped in Russian vessels to

Odessa is granted a cheaper rail rate to Moscow than that going by other routes.

PEKOES AND PEKOE-SOUCHONGS IN DEMAND.

With respect to the grades of tea required for the Russian market, our representative was informed that, amongst the finer sorts, soft pekoe-flavoured teas, (*i. e.*, teas that are not too strong and purgent), are mostly in demand, and we would therefore recommend the owners of estates such as St. John's and High Forest, or in any district where teas of a similar flavour can be obtained, to offer their teas here to Russian buyers, beginning with occasional invoices to try the market. The chief demand is for good medium and common teas, in fact, these form by far the larger proportion of the teas purchased for Russian consumption. These inferior teas are chiefly used in the packet trade for the poorer classes, and, so far as can be ascertained, the medium and common teas preferred consist of sweet pekoes and pekoe-souchongs. The Moscow importers would naturally prefer to get these teas, which are used largely for mixing with Chinese tea, direct from Ceylon, so as to obtain them in a fresher condition; and it must also be borne in mind that the estates selling these lower grades on the Colombo market would save something like five to ten per cent. on shipping and London dock charges.

PACKING.

In conclusion, we may add that the present method of packing tea is suitable for the Russian market, although a light tare is preferred.—*Times of Ceylon.*

CACAO.

Commenting on Mr. Carruther's report on cacao disease, a Ceylon planter remarks:—We *know* now that fungi are at the bottom of cacao troubles: before, we were all making wild guesses and confusing cause with effect. We do *not* know yet whether the same species of fungi live on jaks and erythrinas, and in our jungles and chenas whence insects of all descriptions may convey infection to healthy cacao. We do not know how long the spores can live without a congenial host, and we do not know how *pods* become infected.

"It would be worth while trying to find out if the West Indies had this self-same blight and whether Forastero varieties survived after all Caraquez were killed out."

Mr. Bruijning, of Wageningen, writes to the *Indische Mercuur* of Dec. 17, as follows:—

The cacao shells, which in the technical working-up of the cacao seeds fall off, possess little value from an industrial point of view; they are useful for few purposes, and serve now and then for the adulteration of agricultural food-stuffs and inferior chocolate. It is evident that the amount of husk in a lot of cacao seed is not entirely immaterial to the manufacturer.

By the kind intervention of the firm of A. Driessen of Rotterdam, I was afforded the opportunity of examining 15 original samples of various origin, and to ascertain the amount of husk in them.

The results obtained are comprised in the following table:—

Name, as reg. origin.	100 gram seed consist of		Average weight of a seed (unhusked.)
	kernels.	shells.	
Java cacao ...	... 92·9 %	7·1 %	1·236 gram
St. Thomas cacao ...	... 92·3 ,,	7·7 ,,	1·348 ,,
Surinam cacao II ...	... 91·4 ,,	8·6 ,,	1·149 ,,
Trinidad cacao ...	... 90·9 ,,	9·1 ,,	1·286 ,,
Para cacao ...	... 89·8 ,,	10·2 ,,	1·136 ,,
Porto Plata cacao ...	... 89·5 ,,	10·5 ,,	1·292 ,,
Haiti cacao ...	... 88·6 ,,	11·4 ,,	1·317 ,,
Bahia cacao ...	... 88·4 ,,	11·6 ,,	1·379 ,,
Puerto Cabello cacao ...	... 88·1 ,,	11·9 ,,	1·598 ,,
Surinam cacao I ...	... 88·1 ,,	11·9 ,,	1·637 ,,
Machal-Guayaquil cacao ...	... 88·0 ,,	12·0 ,,	1·537 ,,
Aribba Guayaquil ...	... 87·0 ,,	13·0 ,,	1·628 ,,
Carupano cacao ...	... 86·8 ,,	13·2 ,,	1·469 ,,
Caracas cacao ...	... 86·6 ,,	13·4 ,,	1·504 ,,
Grenada cacao ...	... 86·6 ,,	13·4 ,,	1·230 ,,

From these figures it appears evident, that not unimportant differences exist between the amounts of husk of different varieties of cacao; at the same time it appears from this, that there is no definite connection between the amount of husk and the weight of the grain. I must first, however, wait for a closer description of the varieties referred to, as only a thorough examination of a large number of samples of different years would be able to show how far the various peculiarities of the samples already examined are constant.

NITRATE OF SODA.

THIS article has assumed so much importance as a fertilizer that a few remarks on prices during the year can scarcely fail to interest our readers. Paucity of supplies is again complained of. Low prices have checked supplies and stimulated demands, and Messrs. W. Montgomery and Co. reviewing the present position of the article, state that nitrate now holds the nitrogen field both in importance of quantity and in cheapness. The consumption in Europe during the half-year ended 30th June last amounted to 766,000 tons, of which quantity the Continent took 666,000 tons and the United Kingdom 100,000 tons. These figures represent an increase of 6 per cent. for the Continent, and of 22 per cent. for the United Kingdom. Even these increases would in all probability have been larger if more nitrate had been available when it was required. On more than one occasion the available supply sank to very small dimensions, and steamer transhipments from port to port were in several cases resorted to. The stock on 30th June amounted to 46,500 tons, and the process of building this up to a respectable figure during the summer and autumn months has proved almost an impossibility, the arrivals (owing to small shipments from March to September) being little more than equal to actual consumptive needs. The result is that the stock in Europe to-day stands at only 132,000 tons as compared with 245,000 tons in 1897 and 348,000 tons in 1896. Consumers are therefore dependent almost entirely upon arrivals, a factor of such uncertainty as often to cause much inconvenience and anxiety throughout the agricultural season. The quantity afloat is 565,000 tons (against 344,300 tons in 1897), every ton of which will, with favourable weather conditions, be needed, the outlook for consumption being of the most satisfactory character.

As to the supply for the coming season, Messrs Montgomery regret its apparent insufficiency, which the following figures would seem to show:—The visible supply to-day is 697,000 tons, of which quantity there may be relied upon to arrive at destination in time for consumption between 1st January and 30th April next 667,000 tons; adding the January and February steamer shipments, say 60,000 tons, there is a total of 727,000 tons. The consumption in the same period of 1898 amounted to 630,000 tons, plus the large stock (this year said to be practically non-existent) which was in dealers' and consumers' hands, variously estimated at from 50,000 to 80,000 tons, say 50,000 tons. This therefore leaves to cover loss in weight, loss by marine accident and stock in the ports (which can hardly ever get below 40,000 tons) only 47,000 tons; together 727,000 tons. Thus no allowance is made for an increased consumption, after taking into account the 50,000 tons of interior stock last year. We are therefore compelled to conclude that the producers have again failed to ship enough but, in view of the wretched prices obtainable, it is matter, for little wonder that they should have shown only a minimum of enterprise in this respect. Prices have not fluctuated to a very wide extent during the year, which opened at 7s. 6d. per cwt. for arrived cargoes and 7s. 7½d. per cwt. for season's arrivals. With occasional periods of stiffness, the general tendency was one of weakness, until in April 7s. 1½d. was touched for an off coast cargo, summer arrival being, at the same time, done at 6s. 10½d. This fall was attributable to want of confidence in some quarters as to the eventual out-turn of the consumption, as with no combination agreement in force to restrict shipments, there was an undue desire on the part of dealers to avoid the possibility of having to carry over stock. Such policy, however, was overdone and the market speedily recovered; summer arrival advancing to 7s. 6d. per cwt. whilst autumn and spring arrival improved to 7s. 6d. to 7s 7½d. Prices during summer were no doubt assisted by small stocks and small shipments, and, with only a moderate supply of tonnage in sight for the autumn shipments, values were well maintained with various small fluctuations at from 7s. 4½d. to 7s. 9d. for Sept. Dec. sailings. An improvement subsequently set in, and the cargo market closes with a firm tone at 7s. 7½d. to 7s. 9d. for season's arrival as in size and position. Refined quality has throughout the year been in good demand at 2d. to 4d. per cwt. over the price of ordinary quality.

TEA, &c., COMPANIES.

The Glasgow Estate Company, Limited.—The eighth Annual General Meeting was held at Colombo on 28th ultimo. Mr. J. G. Wardrop presided. The annual report was as follows:—

ACREAGE.

Tea in full bearing	431	acres.
Do. partial bearing	167	„
Do. not in bearing	36	„
Tea Clearings	16	„
Grass	2	„
Jungle, &c.	62	„
Total Estate	714	acres.

The cost of delivering the Tea from the Company's estates in Colombo was 26·79 cents. per lb. The crop secured amounted to 290,100 lbs. Tea, against 277,600 lbs. in 1897. The nett average price obtained was 49·71 cents, per lb. against 51·57 realized last year. After allowing for depreciation of Buildings and Machinery, the amount at credit of Profit and Loss Account for the year's working is R57,828·65, being equal to 17·79 per cent. on the paid up Capital of the Company. To this must be added the sum of R2,403·51 brought forward from last year, making a total of R60,232·16 at the credit of Profit and Loss Account. An interim dividend of 5 per cent. was declared on 28th July last, and the Directors now recommend the payment of a final dividend of 10 per cent.. making 15 per cent. for the year. In accordance with the policy approved of at the Annual General Meeting held last year, a sum of R10,693·90 was placed to the Extension Fund. The Directors again deem it advisable to place a further sum of R10,000 to credit of this account, and it is trusted that this will meet with the approval of the shareholders. The addition of this R10,000 will bring the Extension Fund up to the substantial sum of R60,000. This leaves a balance of R1,482·16 to be carried forward to the current year's account. The estimate for this year is 315,000 lbs. of Tea against an expenditure on Working Account of R79,660. A sum of R2,400 is estimated on Capital Account for completion of withering house and upkeep of Tea not yet in bearing. Mr. H. Tarrant having left the Island, the remaining Directors appointed Mr. Jas. Forbes to fill the vacancy. In terms of the Articles of Association Mr. J. G. Wardrop retires from the office of Director, but is eligible for re-election. The appointment of an Auditor for the current year will rest with the meeting.

The report and accounts were passed and a final dividend of ten per cent. for 1898 be declared.

Agra Ouvah Estates Company, Ltd.—The seventh Annual Ordinary General Meeting of the shareholders of the above Company was held at Colombo on 28th ultimo, at the office of Messrs. Whittall & Co, the Agents and Secretaries. Mr. J. G. Wardrop presided. The report was as follows:—

ACREAGE—31ST DECEMBER, 1898.

Agra Ouvah.	Acres.	Fankerton.	Acres.
Tea in full bearing	302	Tea in full bearing	165
„ not in bearing	20	Timber clearing	10
Grass and Jungle	9	Grass, Patana & Scrub	18
Total Estate	331	Total Estate	193

Grand total 524 acres.

The Crops secured amounted to 271,241 lbs. Tea as against 269,087 lbs. in 1897. This total is about 9,000 lbs. below the estimate, and the shortfall is accounted for by the unfavourable weather prevailing during the last few months of the year. After deducting the cost of manufacturing 77,953 lbs. Tea from other estates the cost of delivering the Company's tea in Colombo was 25·47 cents. per lb. The average nett price for the tea was 53·82 cents. per lb., against 55·05 cents. per lb. in 1897. The gross amount of income from manufacturing tea for other estates was R8,964·61. It is satisfactory to note that the Coast Advances outstanding have been reduced by nearly R2,000. After making the usual ample provision for depreciation of buildings and machinery, the amount at credit of profit and loss account for the year's working is R67,719·23, equal to 18·06 per cent. on the capital of the Company. To the above has to be added a balance of R16,039·21 brought forward from 1897, making the total balance at credit of profit and loss account R83,758·44. An interim dividend of 7 per cent. was declared and paid on 13th August last, absorbing R26,250, and the Directors now recommend the payment of a final dividend of 11 per cent., making 18 per cent. for the year, and that the balance of R16,258·44 be carried forward to the current year's account. The estimate for this year is 280,200 lbs. tea on an expenditure on the estate of R85,731·26, which outlay includes the cost of manufacturing 150,000 lbs tea expected from other estates for that purpose, and also additions to the machinery and the cost of watercourse referred to below. The Directors are glad to announce that they have arranged with the proprietors of a neighbouring estate for the use of water from a stream passing through that estate; the expense of diverting the stream will be small, and a considerable saving in fuel is anticipated. In terms of the articles of Association, Mr. W. H. Figg retires by rotation from the office of Director, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.

On the motion of the CHAIRMAN, a final dividend of 11 per cent. for the year 1898 was declared.

The Udugama Tea and Timber Company, Ld.—The following is from the Annual Report of the above Company presented at the meeting on 30th ultimo:—

Your Directors regret to report a very serious deficiency in the crop of tea from Saumarez, Ginidomine and Homadola. The estimate was 160,000 lbs. but only 119,737 lbs. were harvested—a deficiency of 25 per cent., upon the estimate and over 22 per cent upon the previous year's crop Such a large reduction in the crop has increased the cost of the tea very considerably and has resulted in a heavy loss. All the estates in the district were very short of their estimates.

The estimate for this year from the above estates is 116,000 lbs but it is hoped that the crops will be increased next year to 150.000 lbs. by a return to manure. The loss on these estates amounted to R8162 09.

Maminadola.—The new clearings have come on fairly well especially the last 80 acres at Nakiadenia; these will give a large crop next year. The first 100 acres were cut down during the year and yielded 18,781 lbs. The crop this year for these 100 acres and a small return from the next 100 acres is estimated at 50,000 lbs.

Factory.—Difficulties with labor, due to the number of Sinhalese employed in plumbago mining, caused the contractor to be very late with this work, and the manufacture of our tea in the new factory was not commenced until the end of September. All the Company's tea is now being manufactured there, and the results so far justify your Directors in taking a more hopeful view for the future. Hitherto the Company's tea has been made in a miserable, inadequately furnished building, with no proper withering room, and it has been absolutely impossible to make good tea. Now we have a new factory with ample water power, plenty of withering accommodation, and good machinery. The prices obtained have already shown a marked improvement. The Company has now, in addition to the 500 acres of tea on Homadola, Saumarez and Ginidomine, 300 acres on Maminadola gradually coming into bearing. This year's crop is estimated at 166,000 lbs., next year we should obtain 250,000 lbs.

COFFEE IN 1898.

The year just closed has been more remarkable for the cheapness and abundance of the commoner descriptions of Coffee than for anything else connected with the trade; and there can be doubt that, under these most favourable circumstances for carrying on the business, the dealers and others have been enabled to secure better profits out of their sales than have been netted for many seasons past. The primary cause of this descent from comparative scarcity and highly-inflated prices to the present conditions governing the article has been, as is well known, the great plethora of supplies from the Brazils, as foreseen years ago, when the 1897-98 Coffee crops of Santos, Rio, &c., first began to be talked of as yielding about 10,000,000 bags. Few persons, at the time, could be brought to believe in so extraordinary a development in the production of one class of Coffee; and those who confessed to having strong "bullish" predilections were loth to entertain the idea of such a possibility, knowing that if realised, it must bring with it something bordering on a

transformation of the whole of this branch of commercial enterprise. Yet we find that what seemed, at the outset, to be exaggerated statements and far-fetched expectations have been fulfilled to the letter; and that with an almost interminable glut of supply coming forward from a single source, within the twelve months dating from July 1, 1897, to June 30, 1898, there has been weighing on the European markets an excessiveness of stocks far surpassing in magnitude any that have ever before been warehoused in the various ports. These at the close of November last contained an aggregate of 223,000 tons, in striking contrast with 158,000 tons in 1897, about 88,000 tons in 1896, over 92,000 tons in 1895, and nearly 65,000 tons in 1894. It is not hazarding too bold an assertion to say that the bulk of the above 223,000 tons of Coffee on hand was composed of inferior growths, which have always been more or less difficult to realise, and have consequently been the means of forcing prices down to amazingly low points, and of thus widening the gaps between quotations for the commonest and finest qualities. The great difference in the value of Coffee, created so unexpectedly, has been the distinguishing feature of the year 1898, and has been preserved from the beginning to the end of the season. To emphasise the facts we state, it may not be out of place here to remark that, grouping the several kinds of Coffee together, as if all came under the same denomination, the general range of prices, as latterly established for landed parcels, is as follows:— Low to good ordinary, including mixed sorts, at 25s to 45s, fine ordinary to low middling at 48s to 64s, middling greenish to fine middling at 66s to 90s, bright coloury and bold at 96s to 120s per cwt. Within this list of quotations are to be found raw coffee beans of every variety of size, make, and colour, adapted to the wants and fancies of the most fastidious of home dealers and exporters; and, putting all the clearances together, it is fair to assume that larger quantities than formerly have been used and distributed over the Continent of Europe during the year now departed. The unusual disproportion between the extent of the assortment of the lower and the finer grades of unroasted Coffee, which has existed throughout the season, has led to extremely stiff prices being paid for all desirable descriptions, which in the flattest of markets have met with ready purchasers at the highest rates of the day. From what may be judged to the contrary, there is no valid reason to look for any modifications of the wide distinctions in value above noticed, as Coffee imported in the near future will probably continue to be characteristically the same as hitherto, so as to keep the selection as narrow as ever for the superior grades; and those who are anxious to lay in sufficient stocks of plantation and similar Coffees must be prepared to do so promptly as soon as they arrive, and also be content to pay the maximum currency of the market. What are really wanted are liberal arrivals of useful medium sorts ranging from 65s. to 75s per cwt. in their "green" state, which would be of immense service in helping the blenders to furnish consumers with a good wholesome beverage at a moderate figure; and at the same time ensure them a constant supply of this aromatic article without its patrons having to forsake it for some other form of non-alcoholic drink.—*Grocer.*

THE ABANDONMENT OF LOW-YIELDING TEA (IN CEYLON) ADVOCATED.

W. D. B. writes to the Colombo papers:—

SIR,—Every little helps at a time like the present when many estates are existing on a bare margin of profit, and some even working at a loss. My suggestion, which would relieve the market of a certain amount of low-class tea, has no doubt been considered by the greater number of Estate Inspectors, and the obstacle to carrying it into effect is probably the disinclination of the Companies to propose to their shareholders a reduction of acreage, and, perhaps, the feeling of private owners that to cut off acreage is to lessen the amount to be obtained by a possible sale; but, if this be the case, it is, more or less, a delusion, as purchasers now-a-days have the figures pretty closely looked into by experts before they venture their capital. My suggestion is not applicable to the high-lying and young coffee districts, but to the old districts where I know for a fact that there are many hundreds of acres producing only 200 lbs. per acre, and under. Such acreage should, I hold, be abandoned forthwith; it cannot hope to make a profit with the most scientific manuring. The method of calculation can be applied to each individual estate, and a study of the sale lists will show that there are a very large number of estates whose average price is below 35 cents. per pound nett, at which I have made my calculations. Every million pounds of tea taken off the market at the present time probably adds a cent to the value of the remainder, and it is the low-grade teas which want most relief, and will, I think, most quickly find it in any lessening of the quantity. Reduction of quantity by working for quality does not pay below 3,000 feet; but, at the same time, lessening the quantity in many cases means more room for withering, and, therefore, the best quality obtainable. I take as a typical example an estate of 350 acres, in which it is supposed that 50 acres give only 200 lbs., and the remainder 400 lbs. per acre, and, by abandoning the 50 acres, it is seen that the profits are not lessened, and will probably be increased by the rise in the market, and the better wither.

	350 acres 130,000 lbs.	300 acres 120,000 lbs.	Decreased Exp'ture.
Superintendence at R10 per acre, and a Conductor ...	R 4,220	R 3,720	R 500
Allowances	240	240	
Weeding at R1 per acre ...	4,200	3,600	600
General Transport	50	50	
Contingencies	600	550	50
Roads and Drains	350	300	50
Bungalow, Lines, &c, upkeep ...	500	500	
Factory and Michinery at ½ct. per lb.	650	600	50
Tools and Baskets, &c. ...	150	150	
Pruning at R6	2,100	1,800	300
Plucking	12,500	10,800	1,700
Manufacture at 2½ cts. ...	3,250	3,000	250
Packages at 2½ cts.	2,600	2,400	200
Carriage at 1 ct.	1,300	1,200	100
Sundry Expenses, Insurance, &c	500	500	
Charges in Colombo at 1 ct. ...	1,300	1,200	100
Visiting	500	500	
	35,010	31,110	3,900

350 acres produce 130,000 lbs. at 35 cts. nett = R45,500. Profit R10.490.

310 acres produce 129,000 lbs. at 35 cts. nett = R42,000. Profit R10.890.

It costs in fact 39 cents. per lb. to produce the 200 lbs. per acre which is sold at 35 cents.

Agras, January, 24th.

Apropos of the above, Mr. Robert H. Elliott writes from Nuwara Eliya to the *Ceylon Observer*:—"As the policy of judiciously abandoning the poorer portions of tea estates in Ceylon is now being considered in the press, it may interest many of your readers to learn that a similar policy is now being adopted in Mysore as regards coffee estates. "Two courses being given when in doubt choose the safest," is an old maxim; and there can be no doubt that planters, by turning their attention exclusively to their best lands, will be diminishing their risks to the utmost. For (1) they will diminish the demand for labour; (2) have, of course, a better command of it; be able (3) to almost entirely get rid of the objectionable advance system with all its consequent losses and worries and waste of time; be able (4) to reduce production; and (5) make themselves more independent of the risks of the season which, of course, tell much more on poor and exposed lands than on the richer and well sheltered portions of estates. In a word, a policy of judiciously abandoning risks and worries will diminish while the certainty of profits will increase.

I was lately told by one of the Ceylon planters that the currency measure is a blessing in disguise, but it can only become so if planters adopt a policy which will enable them to make up, as far as possible, for the losses incurred by the measure. Now is the time for action.

Though it is clear that the currency measure will, if an abandoning policy is adopted, be a blessing in disguise from one, and a very important point of view, we must not lose sight of the fact that the saleable value of all property will, both here and in India, be diminished For the loss of confidence which the measure has caused must certainly continue as long as we have a managed currency, and that too, no matter what modifications of the present policy may be adopted.

By the term "judiciously abandoning" I mean, of course, abandoning in whatever form and degree may be most suitable to the circumstances of each particular estate"

A HUNDRED YEARS AGO.

A "CENTENARY" price-list has been issued by Messrs. W. TUCKER & SON, of 32, High-street, Christchurch, who this year celebrate the hundredth anniversary of the establishment of the business by AMBROSE TUCKER. The following extract from an account on the books of AMBROSE TUCKER, 1802, may afford interesting comparisons with the prices of the present day :—

	£ s d		£ s. d.
4 lb souchong	... 1 12 0	12 lb mould candles ...	... 0 11 6
2 lb hyson	... 1 4 0	6 lb stable candles ...	... 0 6 6
1 lb coffee	... 0 7 0	36 lb yellow soap ...	... 1 6 3
1 lb chocolate	... 0 5 0	1 lb starch	... 0 1 0
1 loaf of sugar (9¾ lb.)	... 0 10 6¾	Bottle anchovy sauce ..	... 0 1 6
6 lb moist sugar ...	... 0 4 9	Bottle Indian soy ..	... 0 2 6
3 lb currants	... 0 2 4½	2 lb blacklead	... 0 2 0
3 lb sun raisins... ...	... 0 2 3	2 Bath bricks	... 0 0 9
2 lb muscatels	... 0 3 0	Flask oil	... 0 2 4
½ lb almonds	... 0 1 6	Bottle capers	... 0 2 6

PEPPER.

IN the course of a series of interesting papers on "Popular Botany," M. Philip MacMahon, Curator of the Botanic Gardens, Brisbane, writes in the Queensland Agricultural Journal:—The plant *Piper nigrum* is that from which we derive that most useful condiment, pepper, both black and white, the latter being produced by allowing the fruits to ripen before they are picked. Pepper has had a very respectable antiquity, and was at one time held of no small account. We read that Alaric, king of the victorious Misigoths, demanded, in approved modern fashion, a war indemnity from the Romans, whose city he had invested. The items were 5,000 lb. of gold, 30,000 lb. of silver, 4,000 silk garments, 3,000 pieces of fine scarlet cloth, and 3,000 lb. of pepper. This was 1,490 years ago. A pepper-corn rent is looked upon as the very easiest form of tenure; but it was a very serious form of rent indeed in the Middle Ages when it was first introduced, and meant payment of 1 lb. of pepper yearly. This plant is a native of close valleys in South-Western India, in a latitude corresponding to that of our Northern districts north of the 20th parallel, but it has been introduced into several other countries, notably Java, where it is cultivated at a great profit. It must have the shade of trees, and a common way of growing it in India is to clear the jungle of undergrowth, allowing the trees to stand, and planting at the base of each a few vines, manuring them with some decayed leaves. This would prove a good way of trying the plant in the scrubs near the margins of some of our Northern streams. It propagates quite easily from cuttings, of which there are any number here. In artificial plantations the mother trees are usually mangoes, Jack fruit, or Erythrina indica.

It may be mentioned here—and this is true of almost all the subjects touched upon in these papers—that the avocation of a pepper-planter is one in itself in the countries where this article is produced in perfection. The methods employed in, say, India, Java, and Sumatra are quite distinct. The writer of these papers disclaims any intention or desire of urging or advising any cultivator to dissipate his energies over a variety of products, or to waste too much of the time which he might otherwise usefully employ in "experimenting." He considers that the old-fashioned advice, "Put not all thy eggs into one basket," is pretty well played out. His advice is, "First know your basket, get as many eggs as possible into it, and then look after that basket." The latest price current for pepper in London was 4d. per lb., and over 23,000,000 lb. are annually imported.

CEYLON TEA IN 1898.

Ceylon tea has at last had to cry "halt" to increasing deliveries and public favour. "The fact is," says the *Grocer*, "that the bulk of the supplies are too light and pointless, and the trade would be glad to do without them very often, as they always have to take losses on stock that does not sell at once, owing to their losing the freshness and flavour within a few weeks of arrival. Again, the sale of 'pure Ceylon' packets (compelling those who label it 'pure' to use only Ceylon) is being greatly interfered with by the big blenders, whose numbers and power grow rapidly each year; the competition has, therefore, benefited the stronger and more pointy Indian growths to the detriment of Ceylon and China. Our imports for the year show an increase of about 1 million lb., or say 94 million lb. against 93 million in 1897. Deliveries however, have fallen off 1 million lb.—viz., about 94 million lb. against 95 million lb. in 1897. Deliveries for home consumption have fallen off still more—viz., 2½ million—but this discrepancy was made up by an increase of the exports of over 1 million lb. It will be noticed that these increases and decreases in Indian and Ceylon Tea respectively commenced from last April onwords. The stock on January 1, 1898, was 16½ million lb. and next year ('899) we shall start with about the same. We notice by our Ceylon advices that the total crop for 1898 shows an increase of about 4 million lb. over 1897. However, foreign countries outside the United Kingdom have taken some 5½ to 6 million lb. more direct, while 1½ million less have been sent to the United Kingdom. Australia has taken one-sixth more. or say 2½ million more; America three times more, or say 1¼ million more; and Russia six times more, or say 1¾ million more. Direct exports from Colombo to other countries outside the United Kingdom, together with the exports from here, may therefore be roughly put down at 34 million lb., so that some 22 million lb. have been diverted from the home market. The market opened with low quotations for Pekoe Souchongs and Pekoes, viz., 4¾d to 6½d, and capital broken Pekoes at 8½d. to 9½d., but finer teas were light and difficult of sale up to 1s, finest being scarce. There was a steady demand all through January, but in February quite a slump set in, and the prices ruling for broken Pekoes at 6d. to 9½d. were simply astonishing. Trade in March was very quiet, but prices showed no change for the ordinary kinds, which were condemned by the trade and the shippers as poor and thin; anything with quality and colour, however, brought rather firmer rates, and grades above 1s. were conspicuous by their absence. In April the quality began to improve, and with a better trade demand from 65s to 75s per cwt. in their 'green' state, which would be of immense service in helping the blenders to furnish consumers with a good wholesome beverage at a moderate figure; and at the same time ensure them a constant supply of this aromatic article without its patrons having to forsake it for some other form of non-alcoholic drink."

GREEN TEA IN THE UNITED STATES.

The following is from a letter for Mr. Larkin to Mr. Mackenzie, the Ceylon Tea Commissioner :—

I have just been showing those Ceylon Greens to the people in the Japan trade, and they all agree with me that they are exactly on the same lines as Japan tea, only they are finer than even the earliest pickings of Japan, as they are more astringent, drawing the same kind of liquor and having the same kind of smell and taste. We can thank our stars that, although these teas are similar to Japan, so far the Japanese have not been able to make a black tea, for the Japan blacks I have seen in the past have been most wretched.

THE TEA MARKET.

The future of this market seems to be a little more hopeful owing to the great expansion of the demand in countries outside the United Kingdom. In the nine months ended September 30th last these outside markets have consumed over nine million pounds more than in the corresponding period of 1897, and the following figures show that the demand has been steadily increasing for some years past :—

	lb.		lb.
1898 ...	42,918,654	1895 ...	25,002,230
1897 ...	34,859,215	1894 ...	20,905,531
1896 ...	28,250,961		

Fully one-half of the total for 1898 was shipped direct to these foreign markets from Calcutta and Colombo. Ceylon tea is most in favour, the increase being about six million pounds as against less than two millions of Indian varieties.

In addition to the increased foreign demand there has also been a larger home consumption. Last year, it will be remembered, there was a decrease in the latter, owing partly, it was said, to the engineers' strike and partly to the efforts to push cocoa. This year the increase is well above the normal. For various reasons the Indian growers are expected to supply the United Kingdom with only about two million lb. more than last year, while Ceylon only shows an increase of from 3 to 4 million lb. Stocks are, therefore, diminishing instead of increasing, as in past years, and a healthier tone prevails in the market. Some stress is laid upon the altered conditions of training which are expected to lead to an improvement in business later on. The great difficulty in the tea-trade is that four-fifths of the Indian shipments are made in the six months from August to January. In those six months of 1897-8 the shipments exceeded the deliveries by about 34 million lb and this surplus stock had, of course, to be held by the market until supplies grew more moderate. The old firms had been accustomed to hold the smaller stocks of earlier days, but their resources had not grown with the expansion of the business, and in the last few years there has been a greater tendency to push the stock on the market when the conditions were unfavourable. Buyers, knowing the weak state of the market, did not come forward and took as little as possible in order to gain every advantage from forced sales. There is a limit to this state of affairs, and the creation of a number of joint-stock sellers of tea is helping to improve matters. These large dealers with their numerous shops find it advantageous to buy in considerable quantities and as direct from the growers as possible. Their resources enable them to carry their stocks for some time, and as their number increases the competition when prices are depressed tends to grow. So far this new order of things has not had much effect, but prices have improved a good deal of late and it is hoped that the development of competition among buyers may strengthen the market for Indian teas. Ceylon teas do not suffer from the same cause, except sympathetically, as the produce from the island comes in fairly regularly each month, and at no time do shipments exceed delivery to any great extent.

RUBBER.

SOME RECENT DEVELOPMENTS IN RUBBER CULTIVATION.

During a trip of several months through the old rubber producing regions of Central America and the northern states of South America, I found a great interest in rubber cultivation, and preparations were being made to start very considerable undertakings, particularly in the British West Indies, where the fact that rubber never has been indigenous to those islands is not considered in the enthusiasm of the people. On the island of Trinidad I found this enthusiasm increased to a substantial boom. Rubber seeds were selling at five cents each, and young trees were wanted at fifty cents, though owners were refusing to sell year-old trees about two feet high for less than a dollar a piece. It was reported that two English companies were about to begin operations in Trinidad and were proposing to invest a combined capital of $5,000,000, while private enterprise would probably bring $2,000,000 more to the island, making a total of $7,000,000 prospective capital to be invested in that one locality. Other islands were becoming interested. In Grenada seeds were in demand, with the prospect that a very considerable acreage will be set out.

The most interesting point under discussion in relation to rubber-planting in the British West Indies is a series of experiments now being carried on in London and Trinidad, by which it is proposed to secure rubber from year-old trees of the *Castilloa elastica*. It has been found that seeds sown broad-cast over a prepared field will yield an abundant crop of young trees, which at about a year old can be cut and sent to a factory where, with ordinary machinery operating a simple process, 8 per cent. of fine rubber can be extracted from the young shoots. This can be done in the laboratory. It is claimed that the process is a simple one, that but little machinery is necessary, and that in future the world's rubber supply will be secured from an annual crop of young trees sown on cultivated estates, and not from remote forests as at present. A series of experiments has shown that the young tree contains about 8 per cent. of rubber, which would at present prices return an estimated profit of $200 to $400 per acre. The extraction of rubber from young shoots has been accomplished chemically in the laboratory, but whether it can be applied to the economic production of rubber on a large scale remains to be seen.

Castilloa elastica will grow almost anywhere, but it will yield a profitable flow of milk only under favourable conditions, and these conditions are dependent on the geological formations and topographical features surrounding the trees. To form an opinion in regard to these matters requires an economic geologist of some skill, and because of the fact the greatest losses will be made, for, as it is in mining and kindred enterprises requiring technical skill, uniformed people always considered themselves competent to judge and most of them will have no use for the trained observer. As rubber-trees will grow almost anywhere, and as the period of waiting before a crop can be expected is a long one, the successes that some will make afford an example on which to secure money and lose it to the profit of promoters and their associates who will claim to be thoroughly posted and to control lands that fulfill every requirement.

By forestry cultivation I mean the care of rubber-trees in their natural forests, assisting nature to reproduce them; by husbandry I mean the cultivation of rubber-trees in plantations and an attempt to force them under conditions different from their natural surroundings.

Opinions in regard to suitable rubber lands vary to an unusual extent. This is because many observers have noted one species of rubber-producing tree and its special surroundings, but have never noted all the conditions common to the several species. In America rubber is mostly produced from *Castilloa elastica*, and several species of *Hevea*, each of which is found under quite distinctive surroundings. As a result, general opinions on rubber lands, are three times differently expressed. One man will feel assured that rubber to be successful must be planted on the land that is inundated a few feet at least once a year; another will say that low ground near a wet swampy country is the only available locality; while still another will talk of the medium upland country as the most promising.

These are widely different opinions, yet each is correct. Some species of *Hevea* do best on low ground that is subject to slight annual floods. Other species of the tree thrive over low, rich woodlands just beyond the reach of floods. *Castilloa elastica* does well on the foot hills wherever there is a rich, clean soil and abundant water. It is also found in low, swampy ground, but amid such surroundings does not yield as fine rubber as in the healthier localities.

Rubber is taken from a number of trees and vines, but the species that I have noted yield the commercial supplies of America; of these *Castilloa elastica* is of the most interest to people who think of planting, because it does well on healthy ground where a man from the temperate regions can expect to live and see his trees develop.

The proper land should be clean, rich, and abundantly watered, with a good drainage. Such lands give the best returns. The trees grow abundantly on low unhealthy lands, but do not yield so good a quality of rubber, for which reason if one proposes to cultivate it is well to have the best, and on this much will depend, for it will have an important bearing on results. Of the two methods of cultivation that are being tried little has been done with forestry as yet, but the few experiments that have been almost universally successful and promise important developments for the future. Husbandry so far has not been a great success, and in many places rubber-trees have been carefully planted and given any returns, though it is claimed that some tended for a long term of years but have not of the trees are twenty to forty years old.

The claims in favour of husbandry are that a great number of trees can be planted on one acre, and that all are within easy reach, while better returns can be expected from cultivation than from the natural conditions of the forest. It must be borne in mind, however, that *Castilloa elastica* is a tree of the shade, and that the flow of sap, and not beautiful proportions or an abundant yield of fruit is the object sought. Another important point is that the tree has a comparatively tender bark in the shady woods, which in an open cultivation becomes much heavier as a protection against the sun and dry air at the expense of the flow of sap, and

the provisions of nature which permit the tree to grow anywhere defeat the objects of the planter and makes rubber-cultivation a doubtful undertaking. Hence in many cases the thousands of dollars that are being invested in such enterprises will be the source of grievous disappointment. On the other hand, a careful selection of a run of forest property where rubber-trees reproduce themselves naturally, must yield returns that will surprise even the most sanguine expectations.

Castilloa elastica reproduces itself freely. It has been compared to the pine—a slow-growing tree which does not propagate itself rapidly. It should, however, be compared with the chestnut of our northern forests. If a stretch of well-situated land were allowed to grow up wild here at the north, it is certain there would be a fair proportion of chestnut-trees that would probably come up on the property. If, besides these natural results one or two camps were established on the place and a few men were kept working about through the woods planting chestnuts and looking after the trees, it is certain that the care and attention would result in a heavy percentage in favour of the planter. Similar results can be expected in the tropical forest, using the same methods but substituting the care of rubber-trees for the chestnut-trees that I have taken as an illustration.

I have noted strong evidence in the tropical forests that rubber-trees will produce themselves whenever in the locality is naturally adapted to such reproduction, and with a little care such as could be given by three to ten men according to the size of the property taken in hand the results will be beyond the most sanguine expectations. The great question is to secure a good run of healthy forest land in a suitable location. This being done, but little more is required. A few ordinary labouring-men and the investment of a small amount each year will after a time return thousands annually. In the forests the rubber-tree can be relied on to produce an abundant flow of sap. In open cultivation it must protect itself from the sun and dry air, and the results are doubtful, though some well-situated plantations will certainly yield bountifully. Another important point is that forest land is cheap in most rubber countries, and it is no object to secure a maximum yield from a given amount of land. The object should be a minimum cost of production without regard to the amount of land employed.

After having travelled through all the desirable rubber regions in Central America and northern South America, I am satisfied that suitable tropical forests which can now be had at a low price-often for a few cents an acre—present an opportunity for the profitable employment of capital such as has seldom been offered in the world's history, but the serious point is to secure the proper land. Those who acquire it will have more than they expect, but natural rubber lands are not to be had by simply making a chance location. Though the tree will grow almost anywhere, it is only the most favoured spots that will yield those spontaneous returns that are so very profitable. It is fair to state that if people go to taking up tropical forests promiscuously ten will be disappointed to every one who secures a prize.—*Indiarubber World.*

THE SOUTH OF INDIA PLANTERS' ENQUIRY COMMITTEE.

The following is the Resolution, dated 21st January, issued by the Government of India, in the Department of Revenue and Agriculture, on the report of the South of India Planters' Enquiry Committee, which was appointed to enquire into and report, firstly, on the system of advances to garden coolies and labour-contractors, and, secondly, on the prevention of coffee-stealing. As regards the first head of the inquiry, the points specified were (*a*) the nature of the system as at present worked; (*b*) the necessity for its continuance; (*c*) the difficulties experienced in its operation; (*d*) the best methods of removing them. On the second head the Committee was instructed to report (*e*) whether the conditions under which coffee is produced and brought to market are such as to render it desirable (1) to extend to "parchment" and "cherry-dried" coffee the legislative provisions now applying by section 9 of Madras Act VIII. of 1871 to "green-gathered" coffee; and (2) to amend that section by substituting the word "person" for the words "coolie, maistri or other labourer employed on a coffee estate."

The report of the Committee on being received by the Government of India was communicated to the Government of Madras for opinion, and subsequently for the same purpose to the Mysore Durbar. The Government of Bombay were also asked whether they desired to make any observations on any points in the report which affected the Bombay Presidency. Replies from the two local Governments and the Mysore Durbar have been received, and the recommendations of the Committee have now been considered in connection with them by the Governor-General in Council.

Chapter X. of the report contains the recommendations as to legislation proposed by the Committee to meet the following evils which are characterised as "extremely serious":—

(1) The inability of the planter in any planting district in Southern India to obtain effectual redress for fraudulent breach of contract on the part of "maistris" and coolies under the present system, and to guard himself against serious loss.

(2) The special disability under which the planting interest in the Native States labours, in the absence of any provision for pursuing defaulting maistris and coolies into British India.

(3) The increasing demoralisation of maistris and coolies employed in Native States.

It is remarked by the Committee that against these evils the civil courts necessarily fail to provide an adequate remedy. "Planters," it is stated, "virtually have no remedy at civil law against coolies and maistris who run off with advances. In such cases the remedy of pecuniary damages through the civil courts is but a barbarous and illusory remedy." Nor will the remedy provided by the Specific Relief Act help, it is considered, the planter. The remedy in the opinion of the committee, must be sought in penal legislation. "We have," it is said, "to deal with a system of advances which we have shown to be necessary, and the rights of property cannot be efficiently protected unless these advances are secured by special enactment." It is added that "in no similar case, so far as we know, in India, Ceylon or the Colonies has it been found possible to dispense with a penal labour law." It is recommended by the Committee that Madras Act V. of 1866 should be made the basis of the proposed legislation. Although this Act is at present a dead letter, it contains provisions with regard to the registering of recruiters and the execution of labour contracts which in the opinion of the Committee are urgently required in the Madras Presidency. It is recommended that this Act should be re-cast and in a revised form should be made applicable to emigration to planting districts within the Presidency, to Coorg, to Ceylon, and to Native States in India. The new law, it is recommended, should provide—

(1) for the licensing of recruiters;

(2) for the formal execution of contracts;

(3) for the enforcement of such contracts on lines of legislation more recent, and more applicable to the circumstances, than Act XIII. of 1859, or section 12 of Madras Act V. of 1866.

Under (3) the Committee might have been more explicit in its recommendations. The provisions of Act V. of 1866, it is observed, "of the Ceylon Labour Ordinances and of Act I. of 1882 will form a useful guide in regard to such matters, as well as the responsibilities and obligations of the recruiters. The objects in view would be, first, to preserve to planters in British territory the facilities they at present enjoy under Act XIII. of 1859 for enforcing their contracts; second, to add to these facilities such corresponding obligations as have been deemed proper in the more recent enactments; third, to provide for the control of the recruiting agency; and, fourth, to lay the foundations for the introduction of a procedure whereby planters out of British India, who obtain their labour from the Madras Presidency, may have reasonable control of such labour." There are very considerable differences between the three laws to which the Committee refer as the basis of the proposed legislation—differences so great as to amount to differences of principle.

The Madras Government accept the proposal of the Committee as to the re-enactment of Madras Act V. of 1866, and would apparently provide in the proposed legislation for the execution of warrants and other processes issued by the courts in the three Native States under a labour law of identical character. The Dewan of Mysore, on the other hand, considers the Assam Labour Law unsuitable, and would prefer to amend Act XIII. of 1859. The Government of India have repeatedly expressed their inability to undertake the amendment of that Act with a view to make it a more effective means of enforcing labour contracts for tea gardens in Assam, as the Act was originally not meant to ap

ply to contracts of this description, and is unfair and one-sided in its provisions and liable to be misunderstood and misused. They are constrained to agree with the Government of Madras that if special legislation is required for the coffee industry in Madras, it will have to take the form of the amendment and re-enactment of Madras Act V. of 1866. This in effect would provide a labour law of special application to Southern India, which, while enabling an employer to enforce through the criminal courts a statutory contract against a labourer in the absence of misconduct on the part of the employer will enable the magistracy to require from employers the fair treatment of the labourer, and will refuse to help the unjust employer. Many of the circumstances which have made the Assam Immigration law excessively elaborate and minute, and in its working costly to the tea industry, do not exist in Southern India. In Southern India labour is much nearer the planting districts, is much more mobile and is by habit and experience much more self-reliant and able to protect its own interests. It goes and returns at short intervals, and long-term labour contracts such as are a necessity in Assam are practically unknown in Sonthern India and should not be countenanced by any law which may now be enacted. The Government of India are, therefore, of opinion that if legislation is required for the regulation of labour contracts in Southern India, the maximum statutory term of a contract penally enforceable should not exceed one year or at the utmost two years. The evidence is that the labourers are generally well-cared for on the estates, and that excessive mortality is unknown on the coffee plantations in Madras or Mysore. This will make it possible to dispense with many of the provisions of the Assam Act, though it will be necessary to take power to inspect the plantations and to enforce sanitary regulations.

The Governor-General in Council after a careful consideration of the recommendations made by the Committee which have met with the approval of the Madras Government, will not object to the local Government putting them for closer examination into legal form. Until this is done and the effect of the proposed measure can be more precisely seen, he reserves his final conclusions on the subject. It has been already said that a statutory labour contract for a long term is not required. If it is found necessary to prescribe a statutory contract, the Governor-General in Council considers that the labourer should be at liberty to rescind it at any time without notice on repayment of the advances due by him and of specified forfeit money, and with notice on repayment only of the advances due. The contract should be liable to be cancelled by a Magistrate on specified grounds: its enforcement by a Magistrate should be strictly conditional on the labourer having been properly treated by his employer: guarantees for enforcing fair treatment should be provided on the general lines of the Ceylon and other labour laws: and the extent to which advances should be recoverable from the labourer should be carefully considered. As regards the compulsory registration of labour contracts in the districts of recruitment, the Government of India are disposed to think that such a system is foreign to the practice in the Madras Presidency, as witnessed by the complete failure of Madras Act V. of 1866. The necessity for legislating on this matter will require careful consideration.

The question of extradition is a difficult and far-reaching one. The Committee recommend—

(*a*) that the Native States of Mysore, Travancore and Cochin should be invited to adopt the amended law;

(*b*) that the execution of the amended law should be made reciprocal between the Madras Presidency and Coorg on the one hand, and the Native States of Mysore, Travancore and Cochin on the other, by a convention or mutual agreement.

(*c*) In default of a convention—

(i) that British Magistrates should be empowered to give effect to orders of certain Magistrates in Native States in respect of fraudulent breaches of contracts under the amended law, or (if there be no amendment) under Act XIII. of 1859: or preferably.

(ii) that Magistrates in British India and in the Native States of Mysore, Travancore and Cochin should be empowered by their respective Governments to deal with persons found within their jurisdiction who commit fraudulent breach of contract (as above explained) across the borders;

(*d*) that in the event of either of the above suggestions (*b*) or (*c*) (ii) being accepted the Mysore State should no longer be exceptionally treated in respect of British processes in breach of contract cases.

The Government of India have given their careful consideration to this difficult subject and their provisional conclusion is this: should the proposed legislation for the amendment of Madras Act V. of 1866 be undertaken, there would be no objection to including in it a provision for the execution in the Madras Presidency of criminal processes issued by certain courts, under due safeguards, of the Native States of Mysore, Travancore and Cochin, if and when and as long as a similar law is in force in each such State. With regard to warrants of arrest issued under the proposed labour law, the Government of India are disposed to think that, when any such warrant is sent to another district for execution, it should be discretional to the Magistrate of such district to accept bail for appearance before the court issuing the warrant, or to act in the manner prescribed in section 19 of the English statute at present applicable to cases in which extradition from India is sought by courts in Ceylon.

The special case of Coorg could be met by extending to it, by means of a regulation, or by notification under the Scheduled Districts Act, 1874, the provisions, or certain provisions, of the proposed Madras Labour Law.

There remains the question of amending Madras Act VIII. of 1878, the Coffee-stealing Prevention Act. The Committee deal with this question at length in the last Chapter (XI) of their report, in which after tracing the history of Madras Act VIII. of 1878, it is recommended—

(1). That section 9 of that Act be amended by the addition of the words "parchment and cherry-dried" coffee.

(2). That sections 5, 6 and 7 of the Act, which apply only to purchasers of coffee, be also made applicable to sellers.

(3). That power be given to the Government to prescribe forms of books and accounts for recording sales of coffee, to require returns of produce, and to verify them by entry and inspection.

These recommendations have the support of the Government of Madras, who are prepared to give effect to them by legislation in the local Legislative Council. A communication on the subject of the proposed legislation is being made to Her Majesty's Secretary of State for India.

DISTRICT ASSOCIATIONS.

SHEVAROY.

Proceedings of a Quarterly General Meeting of the Shevaroy Planters' Association held in the Victoria Rooms, Yercaud, on Monday, the 9th January 1899, at 2 p.m.—PRESENT: Messrs. C. Rahm, C. Dickins, S. Campbell, R. Gilby, G. Turner, J. D. Gribble, J. C. Large, T. H. Short, F. Short, B. Short, S. M. Hight, W. W. Hight, S. Pritchard, C. K. Short, T. B. Nicholson, C. G. Lechler, *Chairman*; H. R. Newport, *Visitor*; R. Gompertz, *Honorary Secretary*.

1. *Read* and confirmed proceedings of the last three Committee Meetings.

2. *Read* letter from Mr. W. A. Hardy, stating that he had set up as a Commission Agent at Kannankurichi, near the foot of the Salem Ghaut, together with a list giving prices he will charge for refreshments, etc., and soliciting orders.

3. Regarding the project of a Co-operative Association for direct sale of coffee to the consumer, Mr. Lechler, the Chairman, spoke on the subject of a new scheme proposed by certain well known Planters on the Nilgiris, which will shortly be made public in the form of a prospectus of a Company to which all Planters in South India will be invited to subscribe by taking shares.

4. The following letters were read and recorded:

13/U. W. Circular from the Secretary, U. P. A. S. I., appending for information and for favor of remarks, extracts from letters received from District Planting Associations with reference to Classification of Coffee.

14/U. W. Circular from the Secretary, U. P. A. S. I., circulating resolution passed by the Committee of the Shevaroy Planters' Association regarding the Co-operation among Coffee Planters for sale of coffee either in the raw state, roasted berries, or ground coffee, direct to the consumer.

22/H. Circular from Mr. Hardy, Commission and Supply Agent, informing that he has established himself as such at the foot of the Ghat and requesting the Planters' patronage and support. Prices, etc., on back of Circular.

17/D. Notification informing that certain villages are infected with Plague.

6/N. Letter from Mr. Howard Newport intimating his wish to join the S. P. A.

27/C. Letter from Mr. Cockerton, of South Coorg, asking for some of those beans to keep down Lantana.

Précis of answers to the U. P A. S. I. Circular *re* Ladybirds.

The following Papers were laid on the table.

1. *African Times*, 4 copies, dated October 8th, 15th, 22nd & 29th.
2. *Planting Opinion*, 3 copies, dated December 10th, 17th & 24th.
3. Agricultural Ledger No. 14, Indian Coal—No. 15, China grass.
4. Proceedings of the Wynaad Planters' Association held at Meppadi on 14th December 1898.

(Signed) C. G. LECHLER,
Chairman.

(Signed) R. GOMPERTZ,
Honorary Secretary.

Proceedings of a Committee Meeting of the Shevaroy Planters, Association held in the Victoria Rooms, on Monday, 9th January 1899.—PRESENT: Mr. C. Dickins, Mr. C. Rahm, Mr. T. H. Short, Mr. C. G. Lechler, *Chairman*; Mr. R. Gompertz, *Honorary Secretary.*

1. Read and passed accounts up to 31st December 1898 shewing a balance in hand of Rs.517-7-11 (five hundred and seventeen rupees, seven annas and eleven pies).

2. Read and recorded letter from Mr. Newport saying that he should like to keep touch with Indian Planters whilst in Australia, and requesting Honorary Secretary to enrol his name as a member of this Association, sending him any papers of interest from time to time.

(Signed) C. G. LECHLER,
Chairman.

(Signed) R. GOMPERTZ,
Honorary Secretary.

COORG.

Minutes of a General Meeting of the Coorg Planters' Association, held at the N. Coorg Club, Mercara, on Monday, 28th November.—PRESENT: Messrs. W. M. Ball, P. Bane Singh, H. F. Davy, H. R. East, J. S. Finlayson, W. Green, C. G. Maclean, H. Mann, Jas. T. Morgan, G. R. Pearse, W. H. Sprott, John S. Trelawny, J. D'Vaz, A. J. Wright, H. G. Parsons; Honorary Visitors,' Messrs. J. P. Hunt and F. Seager. Mr. W. H. Sprott in the Chair.

New Member. Mr. W. Green, *Proposed* by Mr. D'Vaz, *Seconded* by Mr. Sprott. *Elected unanimously.*

Delegates' Report. The Honorary Secretary submitted a short report touching on the salient points of the different subjects discussed at the U. P. A. S. I. Meeting in Bangalore in August, and explained the position taken by the Delegates.

Proposed by Mr. Trelawny, *Seconded* by Mr. Ball: That the Delegates be thanked for their services, and that their expression of the views of this Association be cordially approved.—*Carried.*

Correspondence. *Read* Letter from the Accountant General, Madras, stating that the Comptroller General was averse to supplying funds at the Veerajapett Treasury by Supply Bills.

Read Circular letter No. 8, from Secretary, U. P. A. S. I., *re* Duty on Manures.—*Recorded.*

Read letter from the Commissioner of Coorg with reference to expenditure on coolie shelters.—*Recorded.*

The Pollibetta Hospital question was allowed to stand over pending receipt of official intimation; the subject to be brought up again at the next Meeting at Pollibetta; the Honorary Secretary remarking that if Government gave as an excuse want of funds it would be necessary to protest against buildings for the public benefit being virtually abandoned while money was found for the erection of circuit houses exclusively for the use of officials, and which were seldom occupied.

Read letter with statement as to the Land Record Cess. From the accounts it appeared that this department was making an increasing annual profit.

Proposed by Mr. Morgan, *Seconded* by Mr. Trelawny, that the Honorary Secretary should write to the Commissioner of Coorg on the following lines: that the Land Record Cess was imposed with the object of maintaining the department, not with the intention of making a profit; and that as the figures show a large surplus, Government be asked to reduce the cess to a point which will be sufficient to cover expenses only, unless it is prepared to expend the surplus on works and improvements in the Province.—*Carried.*

Circular letters from Secretaries, U. P. A. S. I. *re Tea per* SS. "*Nurani*" were read. The replies from the agents to the Secretary, U. P. A. S. I., were not deemed satisfactory.

Circulars *re* Classification of Coffee were read and recorded.

Mr. Cameron, F. L. S., was here introduced to the Meeting by the Chairman and gave a most interesting and instructive lecture on his tour through the Province, and a hearty vote of thanks was accorded to him.

With a vote of thanks to the Chair the meeting ended.

H. G. PARSONS,
Honorary Secretary.

The following papers were laid on the table.

1. Rules for the sale of Waste Lands in Coorg.
2. P. W. D. Administration Report for Coorg, 1897-98.
3. Circular from District Magistrate, *i.e.*, Cattle Trespass.
4. Petition to Viceroy *re* Encashment of Currency Notes.
5. Stanes & Co's Circular, *i.e.*, Analysis of Soils.
6. Arbuthnot & Co's Export Statement to 30th June 1898.
7. Shevaroy P. A. Proceedings, August, Sept., Oct. and November.
8. Wynaad P. A. Proceedings, September, October and November.
9. Lower Pulney P. A. Proceedings, 30th July 1898.

On Wednesday, 30th November, Mr. Cameron, F. L. S., gave a second lecture at Pollibetta, when the following were present:—Messrs. A. Aclone, L. C. Bearne, E. M. Breithaupt, Jas. Chisholm, H. L. Cuthell, E. Clarke, G. Davies, W. Davies, D. A. Donaldson, G W. Elves, J. W. Finlayson, H. G. Grant, F. W. Gerrard, Jas. Gerrard, G. C. Ganett, A. Hamilton, R. Hamilton, Jas. Hume, R. G. Hutson, A. Johnston, A. H. Jackson, O. Jones, R. Kaundeniya, A. Lambert, R. F. Lumley, John Logan, E. L. Watson, H. M. Mann, H. G. Meynell, S. Marsland, F. Macrae, W. Prater, J. Phipps, H. G. Parsons, Jas. Rose, H. T. Shaw, R. Smith, P. G. Tipping, R. D. Tipping, H. Tippets.

The Honorary Secretary, in introducing Mr. Cameron, remarked that the thanks of the Coorg Planters' Association were due to the Mysore Durbar for so readily lending Mr. Cameron's services on special duty, and that steps would be taken to express their appreciation through the proper channel.

Mr. Cameron having delivered an able lecture, which will probably be embodied in the report of his tour for the benefit of all concerned, was accorded a most hearty vote of thanks, which was proposed in a neat and appropriate speech by Mr. Chisholm, who, at the same time, thanked the Honorary Secretary in the name of the Association for organising Mr. Cameron's tour.

NOTE.—Mr. Cameron will submit a report of his tour to the Secretary, U. P. A. S. I., and has been asked to embody the main points of his lecture and suggestions in his report, so that all other Association may have an opportunity of acquainting themselves with his progress.

H. G. PARSONS,
Honorary Secretary.

WYNAAD.

Proceedings of the Annual General Meeting held at Meppadi, on 4th January 1899. PRESENT:—J. W. Hockin (*Chairman*), H. Atzenwiler, B. M. Behr, E. H. F. Day, R. Lamb, C. A. Mackenzie, D. Mackenzie, W. MacKinlay, J. R. Malcolm, B. Malcolm, J. S. Nicolls, H. S. Powell, S. Robinson, G. Romilly, M. D. Taylor, A. Trollope, W. G. Wright, and E. de Fonblanque, (*Honorary Secretary.*

ANNUAL REPORT FOR 1898.

The Honorary Secretary read the following report for the year:—

GENTLEMEN,

Your Committee now beg to tender their resignation and while doing so, propose to give you a short account of the past year's work.

Financial Condition of the Association.—At the end of the year, 1897, the Association had a debit balance of Rs.99-4-4, and there was also a disputed account of Rs.16 which was writing off; making a total deficit of Rs.115-4-4, which was reduced to Rs.18-4-4 by donations by Members. During the present year, subscriptions, sale of U. P. A. S. I. Proceedings and Labour Contract Forms have amounted to Rs.783-8-0, against an expenditure of Rs.712-14-6, leaving a balance to credit of the Association of Rs.52-5-2.

Members.—At the commencement of the current year there were 40 subscribers on the list of membership.

Of these, however, three (3) had to be taken off the Roll; one being dead and two leaving the district: leaving a balance of 37 Members.

Five (5) new Members joined, making a total of 42; but owing to the lamented death of Dr. Barboza, our ranks are now reduced to 41.

Meetings.—There have been ten Committee and eight General Meetings during the year; most of which have been well attended: and the result of the work, which has been chiefly of a local character has, we think, well rewarded their efforts.

Roads.—The main business of the year on the part of the Association has been to secure a Government Grant towards the up-keep of (1) the Choladi-Calicut and (2) the Chundale-Sultan's-Battery-Roads.

Your Committee have great pleasure in reporting that the continued efforts of the Association have at last been successful, and that after the recent inspection of the roads by Mr. W. B. deWinton, Chief Engineer, D. P. W., assisted by Messrs. Garrett and Wood, a Government order has been issued that a supplementary grant of Rs.10,000 in addition to the present grant of Rs.5,500 shall be given towards the up-keep of the Choladi-Calicut Road and that the Chundale-Sultan's-Battery-Road shall be re-made at a total cost of Rs.74,000 of which Rs.20,000 shall be immediately handed over to the D. P. W. for the necessary metal.

Your Committee feels that the Association is deeply indebted to Sir Arthur Havelock for his support in this matter and for the unremitting interest he has shown in all subjects affecting the welfare of the planting industry.

Pudu Padi Hotel.—Mr T. J. Ferguson has handed over to the Association Trust Fund of this Hotel, amounting to Rs.321-15-0 and also the mortgage on the building and furniture, of Rs.500. Messrs R. Lamb and J. W. Hockin have been appointed Trustees of the latter.

Your Committee would suggest that the salary of the Butler, amounting to Rs.180 per annum, be set aside out of the funds of the Association, so as to leave the reserve fund of Rs.321-15-0 intact, to meet emergencies.

Amendment of Rules.—At the commencement of the current year your Committee, acting under your instructions, revised the rules of the Association.

There are, however, a few alterations to be made in these and your Committee proposes that they should receive your attention.

U. P. A. S. I.—The Central Association has done good work for us in the currency question and in matters affecting the tea and coffee industries generally; and we have especially to thank them for the support they gave our agitation about our roads, which has ended so satisfactorily. Your Committee would suggest that the U. P. A. financial year should end as formerly on the 30th September; as this would make our financial year concurrent with that of the U. P. A. S. I., and enable us to pay our subscriptions to that body on the due date; which it is now impossible to do.

Coffee Robbery Reward Fund.—This fund has not been touched during the year and the balance of Rs.41-12-0 remain intact.

Your Committee would suggest that a new subscription list be circulated and the Police rewarded for the successful manner in which they have stopped the theft of coffee.

Plague.—The near approach of the Plague has caused some alarm in the district, but the Collector of Malabar has taken every possible precaution; not only to prevent its introduction, but also to stamp it out, if we are so unfortunate as to have it in our midst.

Cultivation.—Coffee crops are very good throughout the district, and we trust that we are now entering on a cycle of prosperous years. The competition of S. American countries with a low exchange threatens us, however, with lower prices for a time. Experiments with Arabica-Liberian Hybrids are being carried out on a considerable scale, and promise very valuable results. The cultivation is extending, and prices and yields are encouraging. The only cloud on the horizon of this cultivation is the unreliable nature of the labour, of which tea requires a steady supply throughout the year.

It is to be hoped that this may be overcome in time, but your Committee beg to draw your attention to the importance of making persevering efforts to solve this problem.

Pepper is becoming a cultivation of importance and is being extended: present prices and crops being very remunerative. Liberian coffee cultivation remains much as it was: it is doing well in parts, but is disappointing in others. On the whole your Committee consider the prosperity of the district has improved very much during the past year.

MARKET REPORT.

[*Advices per Mail of 13th January*, 1899.]

COFFEE.

The *London Commercial Record* states that there is no material change to report in the market during the week, the demand for colory Foreign qualities continuing good, whilst other descriptions are dull of sale and rather cheaper. Ceylon again realised extreme rates. Mocha neglected; Nyassaland sold at again cheaper rates. The market for "futures" has shown some slight fluctuations, and the closing prices are a shade dearer.

London	... Santos	... March delivery	...	31*s.* 6*d.*
New York	... No 7 Rio	... " "	...	5·65 cents.

Santos	3,959,000	4,597,000	3,713,000	2,473,000
Total	5,873,000	7,429,000	6,019,000	4,162,000
Crop	—	10,461,000	8,680,000	5,489,000

Rio Exchange 7⅜*d*, previous day 7⅜*d.*

Prices at the close were unchanged.

Messrs. Wm. Jas. & Hy. Thompson say:—

Public sales were resumed on the 5th inst., and since then supplies have been extensive. holders being anxious to sell old stocks now that the new Coffees are coming in. Except for the better qualities, which have sold fairly well, the demand has been very slack, ordinary and medium kinds being very difficult of sale even at a reduction on prices ruling before

the holidays. The few shipments of new crop Neilgherry to hand realized very full prices, the quality so far being poor. Brazil markets have been quiet and lower on larger receipts.

Futures have fluctuated slightly, but the tone throughout has ruled weak, and closing prices show a decline of 3*d.* to 9*d.* per cwt., *viz.* :—Good average Santos in Havre, March delivery, fcs. 38·50, in Hamburg pf. 32, and No. 7 low ordinary Rio in New York $ 5·65.

According to Messrs. G. Duuring & Zoon, the stocks at the European ports on the 1st instant shewed an increase of 2,050 tons, and the total visible supply a decrease of 23,430 tons, being estimated respectively at 224,500 tons and 386,860 tons, against 222,450 tons and 410,290 tons on the 1st December.

Daily receipts averaged 13,100 bags in Rio, and 17,000 bags in Santos

To-day's London official quotations are :—

	Dec.	Mar., '99.	May.	July.	Sept.	Dec.

TEA.

The *Record* says :—CHINA.—Congous are in poor request, but prices continue at the old level. Auctions have offered only small supplies which have partly changed hands at about valuations.

During the week 2,851 packages have been brought to the hammer and partly sold.

INDIAN.—Public sales were heavier, amounting to 44,900 packages compared with 31,000 packages last week, and 59,000 packages for this period a year ago.

The improved tone previously noticed was further accentuated and the auctions passed with spirited bidding for nearly all descriptions, attention being principally concentrated on common to fair and finest grades A rise since the holidays of ¼*d.* to ½*d.* per lb. on the former, and in some instances quite 1*d.* per lb. on the latter may be consequently recorded, which seems amply justified by the unusually strong statistical position. From the Board of Trade returns recently published, Home consumption during the past 12 months in the whole of the United Kingdom as also exports mark a considerable expansion as will be seen by the following figures :—

	1898. lbs.	1897. lbs.	1896. lbs.
Home Consumption	133,430,000	124,534,000	122,941,000
Exports from here	7,856,000	5,497,000	4,306,000
	141,286,000	130,031,000	127,247,000

This, coupled with latest advices that the 1898 crop will probably not exceed that of 1897, should impart further strength to the position.

For 34,900 packages offered on Estate Account 8⅞*d.* per lb. was obtained versus 8½*d.* per lb. for 4,400 packages and 9¼*d.* per lb. for 40,500 packages in the two preceding seasons.

CEYLON.—A larger quantity was brought forward, aggregating 27,400 packages, opposed to 19,600 packages on the 3rd instant, and 24,100 packages at this time of 1898.

There was a steady demand generally, especially for Teas under 7*d.* and over 1*s.* per lb., but between these prices quotation were somewhat irregular, parcels with attractive cup being dearer, while the less desirable ones often shewed a decline.

The average is 8¼*d.* per lb ; on the 5th instant, it was slightly over 8*d.* per lb. and 8¼*d* per lb. at this time in the foregoing year.

JAVA.—Rather under 500 packages of direct import were submitted to competition, and went off well, over valuations in most cases being secured

DELIVERIES.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns were :—

From 1st to 10th January 1899 ... .. 5,722,806 lbs.
„ „ 1898 ... ... 5,413,290 „

During the week the following have been printed for sale by public auction :—

	Sold. Pkgs	Withdrawn. Pkgs.	Total offered. Pkgs
India	42,078	2,808	44,886
Ceylon	25,602	1,839	27,441
Java	404	67	471
Total...	68,084	4,714	72,798

Also 1,074 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, of January 13th, 1899, states :—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	1,008,201 pkgs.	707,478 pkgs.	27,826 pkgs.
1897-1898.	1,018,044 „	733,804 „	26,053 „

45,845 pkgs. Indian
26,931 „ Ceylon
471 „ Java
} Total 73,247 packages were offered in public auction this week.

Customs figures for the year 1898 indicate expansion in Tea consumption at home, Indian and Ceylon together showing an increase of six million lbs. ; re-exports of these grades are also encouraging.

Quantity of Tea (in lbs.) on which Duty was paid at all Bonded Warehouses in the Kingdom from 1st Jany. to 31st Dec.

Other Countries ..	1,179,173	967,574	1,058,090	991,907

Indian. For the commencement of the year supplies were comparatively moderate ; bidding was animated, and a further slight advance on the improved prices noticed last week must be recorded. At the same time the present value of Indian Teas continues unusually low.

Ceylon. 26,931 packages were brought forward, against 19,883 last week. Competition throughout the auction was good, and late prices were fully maintained, the tendency, if anything, being towards slightly firmer rates.

Average for week 8·03d., against 8·13d. for same period 1897.

Ceylon Tea sold on Garden Account, 1st Jan. to date 1899, 44,756 pkgs., av., 8·03d. 1898, 46,362 pkgs., av., 8·28d.

Java. Only 471 packages were brought forward and sold at steady prices.

Bank Rate 4 per cent. Exchange on London three months sight :—
Calcutta 1/4 9/32. Colombo 1/4 9/32.

COCOA.

According to the *Record* :—Catalogues on Tuesday comprised the very large quantity of 11,549 bags, but demand proving rather good holders were able to clear practically half of their offerings. Nevertheless, the tone was quiet, prices realised being 6d to 1s per cwt. below valuations, and only West India growth found buyers. Of 1,670 bags Trinidad, 600 bags were placed at 73s to 75s for middling to fine red—a decline of 6d to 1s per cwt. Grenada growth was represented by the huge quantity of 2,266 bags, of which the great bulk sold at 6d to 1s below valuations, *viz.*, 71s to 72s for superior, 69s to 70s 6d for good to fine red, 67s to 68s for fair ditto, and 64s 6d to 66s for common red. Of 1,445 bags Dominica the greater part found buyers at 63s to 66s, being also about 1s per cwt. below recent quotations. Of the Ceylon offered about 200 bags sold at prices

exhibiting 1s decline on common grades, better qualities bringing about recent rates; good red realised 73s to 75s per cwt. Since the auctions the following sales have been effected:—200 bags Grenada at 70s 6d for good red, 100 bags good St. Lucia at 65s to 68s, 500 bags San Domingo at 62s to 65s, 500 bags African at 67s to 68s, 1,200 bags Guayaquil—greyish to fine Caraquez 69s to 74s, Winter Arriba 70s to 71s, good greyish 76s to 77s, and 900 bags Ceylon at 68s to 75s 6d for fair to good, and 62s to 69s per cwt. for collected.

PEPPER.

Black.—A very firm market prevails, and prices have again advanced. Singapore on the spot has sold to the extent of nearly a 1,000 bags at 4⅝½d to 5d, whilst to arrive 5¼d has been paid for January-March and 5⅛½d for March-May, also March delivery at 5 3/32d to 5¼d; transactions 250 tons. Tellicherry has sold on the spot at 4 15/16d per lb., and to arrive 100 tons done—February-April (s.) at 45s 3d to 46s per cwt. c.i.f. delivered weights and 5 1/16d per lb. landed terms.

At auction on the 11th inst. 279 bags Singapore were offered, of which 40 bags sold at 4⅝d for mixed greyish and 4½d for very light shelly, Penang character. Of 530 bags Penang 70 bags were placed at 4⅜d per lb. for 4lbs. 2 ozs., dust 1·80 % per gallon measure.

Market closed—strong and dearer, with few sellers. 100 tons Singapore sold at 5 1/16d spot, and at 5⅜d Jan.-March shipment.

10 tons Tellicherry Black sold at 46s c.i.f. delivered weights March-May London, also 15 tons ditto at 46s 6d c.i.f. delivered weights Hamburg.

White has likewise further risen. Fair Singapore on the spot has sold at 8¼d to 8½d, good at 9d, fair Penang at 7⅝d, and fair Siam at 8¼d. To arrive 100 tons have changed hands at 8⅝d for Singapore January to April (s.), 7⅞d to 7 15/16d for Penang January-March (s.), 8½d for Siam near at hand, and 8⅝d per lb. for ditto January-March (s.)

At public sale on Wednesday 348 bags Singapore nearly all sold at 8⅞d to 9d per lb. for good. 96 bags Siam sold before the auctions.

Closing tone—firm. Singapore Jan.-March shipment 8⅝d, and spot at 8 9/16d. Penang on the spot sold at 7¾d.

Sweet red.—14 cases Spanish retired at 55s per cwt.

GINGER.

Cochin is a very poor trade, and of 83 cases 306 bags catalogued only 5 cases 20 bags sold—cut small and tips wormy 32s, boldish brown rough, sea-damaged, 20s to 22s per cwt.

Japan is dearer, 65 bags medium and small plump limed selling at 18s 6d per cwt.

Jamaica.—125 barrels all retired unsold.

INDIA RUBBER.

With larger receipts at Pará—1,300 tons to date—prices are weaker and not much demand, and several sellers. Fine hard is about 4s, soft 3s 11¼d to 3s 11½d, with some forward business thereat. Sellers of scrappy 3s 6d to 3s 7d. 90 cases Peruvian and 60 cases fine old hard Pará sold privately.

The following are particulars of to-day's auctions:—

Pará.—18 cases sold, weak fine 3s 9¾d to 3s 10d, weak entrefine 3s 8½d, Cameta negroheads 2s 11d to 3s, mixed coarse and entrefine 3s 7d.

Peruvian.—42 cases sold, fine 3s 11½d, coarse entrefine 3s 9¾d, middling ball 3s 4¼d, scrappy negroheads, poor quality 3s 3d.

Mollendo.—30 bales sold, fine 3s 10d, entrefine 3s 9d.

Mangabeira.—16 cases offered and 12 sold, fair to clean sheet 2s 5d to 2s 6d.

Columbian.—18 bales offered and 6 sold, ordinary to fair scrap 3s 2½d to 3s 4d.

Central American, &c.—237 pkgs. offered and 80 sold, virgin scrap 2s 8d, thick sheet 2s 4d to 2s 5d, Guatemala tarry damp sheet 2s 2½d to 2s 2¾d.

Mozambique.—130 bags offered and 65 sold at high prices; good and fine red ball 3s 7¾d to 3s 8½d, Lamu ball good 3s 2¾d.

Nyassa.—Good clean livery ball, 3s 5d to 3s 5½d.

Madagascar.—17 packages retired above value.

Penang.—82 cases offered and 13 sold, good pickings 1s 2d, mixed damp 1s 6½d per lb.

Borneo.—12 cases sold, mixed part dead 1s 4d, very low pickings 11d per lb.

Assam.—8 packages sold, common pickings 1s 3½d to 1s 5d.

THEY REMAIN UNCHALLENGED!!!

THOMSON'S ANTI-MALARIAL PILLS.

THE PLANTERS' FRIEND.—The only known antidote against Malarial Poison. A sure and efficacious remedy f Malarial Fever, enlargement of the Spleen, Malarial Cacchexia (Anæmia after Malarial Fever) and the other varie symptoms of Malarial Fever.

Price per 100 Rs.3/-

500 for Rs.12/- 1,000 for Rs.21/-

TESTIMONIALS FROM PLANTERS.

GENTLEMEN,—Please send me two bottles of Thomson's Anti-Malarial Pills by V. P. Parcel. Last one bottle yo sent proved very useful. Please send as early as possible.

(Signed) T. V. GUTNE, *Coffee Planter, Bairchalli Estate, Hanabalu, Hassan Distric*

DEAR SIRS,—The fever pills (Thomson's) I have used both personally and for my Assistant and in very many case for coolies and have found them always efficacious.

(Signed) H. ROWLAND NEWPORT, *Manalore Estate, Ahtoor, Madura District*

DEAR SIRS,—I have the pleasure to certify that I have given these pills (Thomson's) to my coolies and others o this Estate for the past few months with the best of results. I invariably dose the patients with a strong purgative Epsom salts; after the motions have ceased, I give three pills. I have never failed to check the fever in a couple of day

COLLINGWOOD & Co., EUROPEAN PHARMACISTS, *Mount Road, Madras.* (Signed) J. D'VAZ, *Greenfield Estate, Sidapur, S. Coorg*

ROYAL EMPORIUM,

BANGALORE.

GENTLEMEN'S DEPARTMENTS.

Tailoring. Under the control of a European Cutter. A splendid range of Patterns in Tweeds and Flannels. Samples on application. Prices extremely moderate.

Outfitting. A complete stock of Collars (all the latest shapes), Ties, (a handsome selection) Hats, Caps, Evening gloves, &c., &c., &c.

Boots and Shoes. Best value in India. Prices to suit every purse.

Pipes. A large assortment of Briar, Meerschaum and Cherry. A complete price list on application.

Stationery. Our prices are the cheapest in Southern India. A complete variety to suit all fancies.

Games. Everything for Tennis, Golf, Cricket and Football.

Miscellaneous. Walking sticks, Umbrellas, Travelling Requisites Everything for Household use.

Trial Order Solicited from those Planters who have not yet patronized us. Upcountry Orders receive personal Attention of the Manager.

Agents for LEA & PERRINS' WORCESTERSHIRE SAUCE.

CROSSE & BLACKWELL'S, LTD.

By Special Warrant Purveyors to The Queen AND Empress of India.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-arly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, cluding postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. r line for the first, 3 as. for the second, and 2 as. for the third and succeed-g insertions. Five-line (or shorter) advertisements from Subscribers will inserted for three issues for one rupee; non-Subscribers will be charged o rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic currence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance should be sent to E. C. Duff & Co., Proprietors, Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 17th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

Please note the change of address.

SOILS OF ARID REGIONS.

S. E. Wynaad. DAVALA, *8th February* 1899.—*Weather.*—The weather is very hot during the day and cloudy at intervals and cool at nights.—*Crop.*—Stripping is the work. The crop will be over the estimate, but the price is very poor and the natives are selling at 40 Rs. per pulla. Grain-gram 20, rice 9 and 10, raggi 18 and cholum 20 measures per rupee. *Interesting Items.*—We have had no police night beat and lucky there are no coffee thefts in this District.

Coorg. POLLI BETTA, *8th Feby*—*Weather.*—The clouds made a terrible demonstration yesterday, but fortunately no rain came of it. Spike is very forward on coffee that has been bearing lightly. Rain might set this; but it had best come next month. *Crops.*—Picking, stripping and gleaning going on. I hear one estate has finished pruning in the western part of the district and others are well forward. Crops next season can't be as good as they are this, but they ought to be fair. New Paddy straw coming in, and is obtainable at 18 Rs. per 1,000 bundles.

PLANTER AND COOLY.

We do not propose to say very much about the Government of India's resolution on the report of the South of India Planters' Enquiry Committee. The finding of the Committee and the remarks of the Madras Government, are in striking contrast to the treatment accorded to the subject by the Government of India. That august body has had the matter before it for over a year, and can now do little more than authorise the Madras Government to put the recommendations of the Committee "for closer examination into legal form." The Government of India has been compelled to distinguish between labour conditions in Assam and in Southern India; it has been educated at last to a knowledge that the South Indian planter really has a grievance; but its admissions on the subject are made reluctantly and grudgingly, and the outcome of all proceedings hitherto amounts to little more than permission to "apply again." Nevertheless, we feel sure that both the Madras Government and the planters will avail themselves of the opportunity that is afforded them, and will turn it to good account. The drafting of a bill is a work of time, and cannot be begun too soon. If the U. P. A. S. I is consulted while the work is in progress, so much the better. It is at least certain, however, that the Planting Member of the Legislative Council will have a hand in the work, and Mr. HODGSON may be trusted to see that things are put on an equitable footing. He has to effect something like a compromise between the stringency of a Labour Act of the Assam stamp and the inefficiency that results from the entire absence of an effective law. He has to steer through the shoals of extradition, yet to arrange that the law of the Madras Presidency shall not be stultified by any cooly who is able to cross the border from British territory to Native. He has to see that reasonable provision is made for official inspection of plantations and the enforcement of sanitary regulations. All this has to be done, not to the satisfaction of a sympathetic Local Government, but so as to pass the criticism of the Government of India, which obviously looks at the matter in the spirit of the fault-finder to whom nothing new is good.

The statement made by the Government of India that "a statutory labour contract for a long term is not required" is immediately followed by the remark that "if it is found necessary to prescribe a statutory contract, the Governor-General in Council considers that the labourer should be at liberty to rescind it at any time without notice on repayment of the advances due by him and of specified forfeit money, and will notice on repayment only of the advances due." Some careful drafting will be necessary here, for the Government regards the matter mainly as if it were a Heaven appointed Defender of the Cooly, and could leave the Planter to defend himself. It is obvious that the forfeit clause will be useless unless a sum is fixed that will act as a deterrent. If only a small sum were named, the condition of things would be dangerous to the planter. So also as regards the term of notice: it must not be too short. If less than six months, occasions might easily, and probably would often, occur where the planter would lose his labour just at crop time, and find himself shut out from any redress or compensation. Moreover, the Government of India rules that the contract should be liable to be cancelled by a Magistrate on specified grounds. This is a point that will need care, for it happens only too often that Magistrates are not competent to decide between planter and coo We could imagine a state of magisterial administrati under which the planter would gladly see wide discret left to individual magistrates. But India has not y arrived near any such state of perfection, and considera allowance must be made for the influence of "general pos and the inexperience of many members of the magistracy w may from time to time be called upon to decide the claims a counter-claims of estate employer and employed. That t enforcement of a contract by a Magistrate should strictly conditional on the labourer having been prope treated by his employer, is right and proper, but su impartiality demands that there should be no cancelm on the part of the labourer unless he proves that he *not* been properly treated. No doubt, Government m protect the ignorant cooly more carefully than the m intelligent planter, but in doing this it must at least av putting a new premium on fraud or on evasion of contra

It is possible that the new head of the Government India may take a different view of this subject fr that expressed by his predecessor. Lord CURZON may adopt as readily as Lord ELGIN has done the opinions Calcutta Civilians, whose knowledge of planting matt must, of necessity, be largely biassed by the affairs Assam. We trust this will be so, but the bill that to be drafted must be drafted so as to meet hos criticism. It should err on the side of leniency to cooly rather than power to the planter. Every word o should reflect a desire merely for reasonable safeguar The planter must have labour, he must pay advanc and contracts thus become a necessity. What he ask simply that these contracts shall be under the *ægis* the law, so that his money may not be embezzled and be left stranded without labourers at critical seasons. real difficulty crops in at any frontier that divides Nat States from British territory. The Native States wo welcome an Extradition Act, but the Government of I would not. To meet this difficulty, a sort of system of r procity was suggested; and the Government of India has decided that there would be no objection to including in new Bill a provision for the execution in the Madras Pr dency of criminal processes issued by certain courts, u due safeguards, of the Native States of Mysore, Travan and Cochin, if and when and as long as a similar law i force in each such State. This is only a *one*-sided reciproc if reciprocity it can be called, but perhaps this results me from careless drafting. At any rate, we presume that e of the above States, when following the Madras lead, w insist on a similar reciprocity clause adapted to its own ne so that when all the new Acts came into force there woul full and complete reciprocity. The matter is a very diff one to handle, for it is highly desirable that the legal machi employed should be of the simplest, and that all comple should be avoided. We can only hope that the bill de will be drafted promptly, and that then things wil allowed to move more slowly, so that planters may have a time to review its provisions.

COFFEE TO REPLACE TEA!

A Kurseong co-respondent writes to *Indian Gard* that coffee grows well in the Terai at about one to two t

sand feet elevation, and says:—"Why not suggest in your next that the Terai tea gardens that are being given up should be turned into coffee plantations? Coffee berries are Rs. 60 per maund at Calcutta. Coffee grows well, but wants shade, and the castor-oil plant (*Ricinus communis*) will give good shade and a bye-product in the seeds. I have some berries now which have been sent to me from a garden here." We are somewhat surprised to find our contemporary remarking upon this:—"The suggestion appears to us to be a good one; and taken in the light of the abandonment of tea gardens in the Terai, well worthy of consideration. Only last Saturday the valuable garden of the Central Terai Tea Company, Ld., of 2,300 acres, with 412 acres planted with tea and a large area under forest, was sold by public auction for Rs. 31,000, the purchaser being Babu S. K. Dass." This would seem to denote a belief that Coffee pays better than Tea just now! We scarcely think that any of our practical tea-*cum*-coffee planters in the South would endorse a statement to this effect! If coffee were grown on a small scale in the Darjiling Terai, merely to meet local consumption, it might be a profitable speculation; but everything goes to show that there is not much room at present for profitable extensions of Coffee growing in India *for Export*.

EXCHANGE OF SEEDS.

THE improvement of strains involves, apart from hybridisation, not merely careful selection of seeds, but a certain amount of importation of seeds from other estates or districts. It has occurred to us that either the U. P. A. S. I. or we ourselves might facilitate the importation of such seeds from abroad, even if interchanges between estate and estate, district and district, were to be carried on without assistance. To do what we propose, we should have either to *buy* foreign seed, or to exchange Indian seed for it. The latter course would seem to be preferable, and to this end we should be glad to register the names of planters who are willing to supply us with carefully selected Coffee seed (and Tea seed, if desired) on the understanding that we use our best endeavours to effect exchanges with cultivators in foreign lands, and then distribute the seed thus received among the planters who furnish us with the means of barter. As an instance of what we think might be done in this direction, we refer readers to our article in present issue, headed "Varieties of Coffee." There is nothing new in this article; but a practical application might be given to it if, offering Indian Coffee seed in exchange, we were to ask the authorities of the Royal Gardens at Kew, at Trinidad, and elsewhere, to supply us with seed of *Stenophylla*, *Maragogipe* and other varieties, for experimental purposes on South Indian estates. It is a mere suggestion on our part, and is thrown out somewhat hesitatingly. If it should commend itself to our readers they will find us very ready to carry out their wishes, whether they desire to receive seed of some special variety or from some particular place, or merely leave it to us to deliver to them such varieties or seeds as come to hand. As far as possible, we would arrange to deliver "weight for weight;" and our services would be free of charge. Should planters prefer to work through the U. P. A. S. I., we have little doubt that that Association would be as willing as ourselves to assist the good works of improvement of strains and introduction of new varieties. Perhaps it should be added that if cacoa, or rubber, or vanilla, or seeds of any other products, are wanted in exchange for seeds of the same or other products, we would do our best to arrange accordingly. Such experience as we have had of correspondence with experts in various parts of the world, leads us to believe that they would cordially co-operate in any scheme for the interchange of seeds on a fair basis, and not for trading purposes.

"PLANTING OPINION."

Our readers will, we trust, have observed that an attempt is being made not merely to give publicity to *opinions* on planting matters but to place *facts* before planters. Information is being obtained from various parts of the world and in reference to different products, plants, fertilisers, &c. Current market advices are also receiving attention, and scientific papers on matters connected with the planting industry are not neglected. Before definitely deciding upon a plan of selection, however, we wish to appeal to our readers for advice. Many among them will, we know, gladly give us hints as to what they think would interest planting readers; we trust that even those who have not the same friendly interest in our welfare will, for the sake of the community they belong to, jot down a few words or figures on the addressed post cards we inclose for the purpose, so as to show to what style of literature they would wish us to give preference, and what innovations, if any, they would suggest. To us it seems that the first thing is to settle the order of merit (or importance) of the following heads or departments:

A	Crop and Season Reports.
	Practical papers on planting subjects.
	Scientific " " " "
	Correspondence " " "
	Statistics, quotations and market reports.
B	Short stories.
	Section for the Ladies.
	Serial story.
	District affairs (other than planting matters).
	Sporting.

It will be seen that group B is not included in *Planting Opinion* at present. If, however, there is a consensus of opinion that all or any of these items ought to be added, arrangements might be made accordingly. All we ask each of our readers is to set down in the space left for the purpose in the inclosed post-card the order of precedence that he recommends, *e.g.*, if he thinks crop reports most important, No. 1 will be set against the item; if scientific papers rank next, No. 2 will be put opposite this section; and so on. That there must be a wide diversity of opinion on this point, goes without saying; so we do not profess that we shall try to fall in with *every one's* ideas. Our desire is to treat the matter as a sort of ballot and to be mainly guided by the wishes of the majority should a sufficient number of our subscribers favour us with an expression of their views. This we sincerely trust they will do.

THE AMERICAN MARKET.

Tea.—From interesting remarks in the *American Grocer*, we learn that the year 1898 closed with tea showing an advance almost equivalent to the duty imposed, though on some grades prices at the beginning of 1899 were not more than 8 cents a pound higher than when the tax was imposed. Importations

were much lighter in the year ending 30th June 1898, than in the last preceding year, the figures being

1897-98	...	...	67,696,339 lbs.
1896-97	...	...	112,907,548 „

Messrs. James and John R. Montgomery report that the estimated supply for the season of 1898-99 is 80,000,000 pounds, of which 57,327,605 pounds were received to January 1st, at which date 7,539,685 pounds were afloat, leaving to be shipped 16,131,710 pounds. The effect of the tea exclusion Act has been to improve the general character of the supply, to send into distribution considerable quantities of low grade tea, which had been held here for years, and to give the market a much healthier and better tone. The year closed with prices firm. The same firm report the statistical position of China and Japan tea for United States and Canada on January 1, as follows (in pounds):

Total afloat to Jan. 1, 1899	... 7,539,685
Receipts to Jan. 1, 1899	... 57,328,605
Total shipment advised by mail ...	... 64,868,290
Leaving to be shipped	... 16,131,710
Estimated supply, seasons 1898 and 1899	... 81,000,000
Supply, seasons 1897 and 1898 ...	... 87,711,780
Afloat, January 1, 1898	... 3,995,301
Receipts to Jan. 1, 1898	... 71,303,603
Total shipments advised by mail to Jan. 1, 1898	... 75,298,904

We may add that *rejections* have been by no means merely nominal. At the port of New York from May 1st to November 3rd, 1898, the following were sustained by the Board of United States Appraisers :—

	Green.	Pingsuey.	Japans.	Dust.
Packages	536	9,775	404	155
Estimated pounds ...	30,420	387,000	30,900	12,500
	Foochow.	Anoys.	Congous.	Canton.
Packages	732	1,564	1,745	30
Estimated pounds ...	36,000	60,000	10,000	1,500

—making in all 15,241 packages of 658,320 pounds.

The following are statistics of Imports :—

Year ending June 30—	Net imports Pounds.	Value. Dollars.	Av. import price, ₱ lb —Cents.	Per capita population Pounds.
1880 ...	69,894,769	18,983,318	27.4	1.39
1881 ...	79,130,849	20,225,418	25.7	1.54
1882 ...	77,199,903	18,975,006	24.6	1.47
1883 ...	69,597,045	16,257,894	23.5	1.30
1884 ...	66,901,944	13,313,200	20.2	1.19
1885 ...	66,374,365	12,135,782	19.5	1.18
1886 ...	78,173,151	15,185,265	19.6	1.37
1887 ...	87,451,186	16,365,633	18.7	1.49

Coffee.—The year 1898 is referred to as a record breaker both as regards the supply and demand. The total supply in Europe and the United States was 14,571,902 bags, an increase over 1896-97 of 2,327,698 bags. To this Rio and Santos contributed 10,462,000 bags; Brazil furnished 76 per cent. of the imports into the United States, against 57 per cent. of the total ten years ago. The world's visible supply December 1, 1898, was 6,969,155 bags or nearly one-half the world's crop for one year. Our New York contemporary observes that coffee production has been on the increase almost everywhere on the Western continent wherever coffee will grow, and it is questionable if the full productive limit of the industry has yet been reached. The deliveries since July have been running lighter than for the same months in 1897, probably because in the spring of 1898, they were phenomenally heavy owing to the withdrawal of stock from licensed warehouses in anticipation of a duty being levied and as deliveries are regarded as consumption, the record is somewhat misleading. Low prices have undoubtedly increased the use of coffee, but not to the extent indicated by the deliveries for the year ending June 30. The total sales for the year on the New York Coffee Exchange were 4,213,000 bags, against 4,028,250 bags in 1897. The average cost of coffee has been lower on Brazil and Central American sorts, while Padang coffee has maintained its price.

The average annual spot cost of coffee is shown as follows.

	No. 7 Rio. Cents.	No. 3 Rio. Cents.	Maracaibo. Cents.	Padang. Cents.
1898 ...	6.30	7.04	8.37 @ 9.14	24.04 @ 24.99
1897 ...	7.73	11.06	12.92 @ 13.45	23.59 @ 24.71
1896 ...	15.00	16.22	13.88 @ 14.30	23.68 @ 24.31
1895 ...	15.83	18.64	17.00 @ 20.88	26.54 @ 27.12
1894 ...	16.40	18.61	18.78 @ 21.02	21.29 @ 23.48
1893 ...	17.08	19.28	19.00 @ 22.17	21.42 @ 25.37
1892 ...	14.43	18.33	16.15 @ 22.41	25.73 @ 26.85

The last Padang sale showed an advance on most marks. Java coffee occupies an exceptional position in the coffee market, maintaining a higher range of prices than is warranted by intrinsic value as compared with other growths, and all, it is observed, "because of the pronounced demand and popular prejudice for Sumatra and Java coffees."

The following are statistics of Imports :—

Year ending June 30—	Net imports Pounds.	Value. Dollars.	Av. import price, ₱ lb —Cents.	Per capita population Pounds.
1883 ...	475,702,125	38,155,251	8.2	8.91

A comparison of quantities and values between 1892 and 1898 is somewhat startling!

COFFEE IN DISTANT LANDS.

IV.

Peru.—In a pamphlet published in 1894 it was stated :—"Peru has been known for many years as a coffee-producing country, but the coffee grown on the Coast has been absorbed by domestic consumption, and Peru's appearance as an exporter of coffee is of recent date, although she is now likely to be a considerable competitor with other countries. Coffee planting began and coffee is still cultivated near the port of Pacasmayo with success. But although the cultivation on the Coast could be somewhat extended it must always remain restricted, as there are only certain favoured localities in which the planter can hope for a good return."

"The region which Peru offers to the coffee planter, unsurpassed in fertility and almost unlimited in extent, is

situated on the Eastern slopes of the Andes at a height of from 6,000 to 2,000 feet above the sea, among the net-work of streams and rivulets that find their way into the great affluents of the Amazon. This region, known as the Montaña, has hitherto been shut off from the world by lack of communications, and above all by the difficulty of crossing the high ridge of the Cordillera that bars it from the Coast. In spite of these difficulties coffee has been cultivated both in the South in the gold-bearing districts of Sandia and Carabaya, and in the centre of Peru in the Valleys of Chanchamayo, Vitoc and Huanuco. It is the Chanchamayo district, for most of the coffee that passes under the names of Vitoc or Huanuco comes from Chanchamayo, which is the real coffee-planting district of Peru, and it is the production of this region that has elevated Peru to the rank of a coffee exporting country. This is due to the completion of the Central or Oroya Railway by the Peruvian Corporation to its present terminus at Oroya, giving railway carriage over the crest of the Cordillera, and also to the opening up of the Perene and adjacent valleys which form its prolongations. Oroya is about 60 miles from the Chanchamayo Valley, and there is a fair road all the way passing through the town of Tarma, the Capital of a Department, with good hotels and some 7,000 inhabitants. The Chanchamayo Valley, itself about 10 miles long; is now in the hands of private owners, but the rich and far more extensive valleys beyond it of the Perene, Paucartambo and Rio Colorado, have now been linked on to La Merced, the last town in Chanchamayo, by the extension of the Tarma-Chanchamayo road, through a short but difficult defile. The output of coffee from the whole region was about 1,500 tons in 1893, but extensive planting has lately taken place and production will shortly be trebled."

"It is considered that coffee can be raised at the expense of five Peruvian Soles per quintal, or 100 lbs., the yield of a tree after the third year being about three lbs. Clearing ground is easy, the hill-sides being covered with dense but light timber, easily felled and burned. The average cost of clearing may be taken at S/65 a hectare (£5·10s.) or S/26 (£2·12s.) per acre. The number of plants that can be planted with advantage on a hectare is about 1,700 to 1,800, or say 700 to the acre, although a larger number are often put into the ground. Young plants can be obtained for S/5 (10s.) per 1,000."

"Coffee is usually bought at the planter's door by Italian houses in Tarma at prices varying from S/18 (£1·16s.) to S/30 (£3), and the cost of transport of a quintal from Chanchamayo or from the Perene, to the port of Callao. by mule and railway is from S/4 to S/5 per quintal. Recent lots have been sold in New York at 22 cents. gold per lb., a price which is equal to that of the best Mexican or Central American, with the exception of one or two favoured qualities and will improve when the coffee is better cleaned for the market. Freight to New York from Callao by the Merchant's Line is £3 per ton, while the British Royal Mail Company have recently put down their rates from £5 to £4 in expectation of increased production."

"The principal difficulty of cultivation in the Peruvian Montaña lies in the broken character of the ground. This in itself is favourable to coffee cultivation, as the hill-sides afford slopes where the young plants can be raised without being exposed to the sun all day long, and the expense of protecting the young plants by artificial shade is avoided. But the broken ground and frequent streams, the necessity of bridges and cuttings, etc, render the question of communications the most important of all. It is this reason that makes the opening up of the Perene so significant, in which Valley the Peruvian Corporation possesses a concession in perpetual proprietorship of a million and a quarter acres. Planters are unwilling to settle aloof from the main roads, and to face the cost of keeping open trails through the forest, and of bridging rivers, where these primary necessities are not undertaken by large capital or by associated effort. There is, therefore, considerable reluctance in taking up free grants from the Government away from the main communications, and a tendency to move into lands like those of the Peruvian Corporation, where solid bridges and roads have been made and are maintained. Moreover the free concessions granted by the Peruvian Government have been characterized by recklessness, and as the ground has never been properly surveyed, and as the concessions that are never officially demarcated are located by means of more or less vague geographical references, there is no security that they do not overlap or will not be a source of dispute and of law suits. Settlers on the concession of the Peruvian Corporation are also exempt from taxes for ten years. Sales of land to planters have lately been effected at the price of £1 a hectare, say 8s. per acre, and there are also colonists on the land receiving advances from the Company, and getting title-deeds in their grants when the advances are worked off. Special arrangements are made with tending planters in special circumstances."

"The climate of the whole Chanchamayo and Perene district is excellent, and malarial fever may be said to be unknown. Labour is supplied by the Indians from the Cordillera, the ordinary wage being from 50 to 60 cents. Peruvian silver per day."

"Besides coffee, cocoa, tobacco, indigo, rice, sugar cane, maize, etc., can be grown on the Perene while wild vanilla is found in the forest and could be brought under domestic culture."

"An experimental plantation of tea is also being made. In addition to the light timber, cabbage-wood, etc., growing in the valley, there are found valuable trees like the walnut and cedar, and several kinds of hard woods."

"NOTE.—The Peruvian sol has been taken throughout as equivalent to 24d. The actual average rate of exchange from the 30th June 1893 to the 30th June 1894 having been 24¾d."

***

We have given the above verbatim, though it refers to a period 4 or 5 years ago. The following paper, for which we are indebted to Mr. Wm. J. Owen (through H. B. M.'s Consul at Callao) brings matters up to the present time. Mr. Owen, who was lately a Coffee planter at Chanchamayo, writes :—

The Coffee yielding district of Chanchamayo is situated about one hundred miles (roughly) from Oroya, the terminus at present of the Central Railroad.

Land can be obtained from the Government, *free*, on condition that one-fifth shall be cultivated within two years and a highroad made and maintained by the owner of the plantation through his property; from the Peruvian Corporation on payment of £1 per hectare.

The average cost of raising Coffee may be fairly placed at *seven* soles per quintal, and not at *five* as stated in report. Also, the yield of Coffee given for 1893, is very much overestimated, though the report that extensive planting has taken place is quite correct.

The cost of clearing and burning is from sixty to seventy soles per hectare for "Montreal" or heavy timber, and for light timber from fifteen to twenty, though the latter class is not favourable to Coffee planting.

The number of plants which may be planted with advantage is about 1,600 per hectare, or 640 per acre. Young plants are sold to colonists of the Peruvian Corporation, by that company at five soles per thousand, the average market price in Chanchamayo being from eight to ten.

Coffee is sold in "La Merced" at from twenty to twenty-five soles per quintal. Up to date no sales have been actually made on the plantation, therefore, cost of carriage from plantation to "La Merced" must be considered.

Cost of transport from plantation to Callao is from five to six soles per quintal, according to distance from Oroya.

Cost of labour on Peruvian Corporation territory is 70 cents, sometimes more, per day. Outside the Colony, 60 cents. per day is the price usually paid.

The average yield per plant may be fairly stated at from 2 to 2½ pounds per plant on the *fifth* year; this, of course, varies as is the case with all crops, but the above amount is about correct. Hence the following:—

per acre 640 plants × lb. 2.5 = 1,600 lbs. or 16 quintals.

The average yearly rainfall is not known, though instruments for determining this and other matters of general information are now being sent up for use in the district

The Coffee is picked and dried, then hulled; at least, this is the present system, but many persons are now thinking seriously of adopting the "Wet system" as being more expeditious and involving less risk of damage to the Coffee from burning and other causes.

To give an analysis of the soil would be very difficult, as it varies so much in character in very short distances that any single plantation will probably have five or six classes of soil: some excellent for Coffee planting and others entirely useless; Lime, however, is met with everywhere;—In some places thick, heavy, black loam is found, in others, a kind of black sandy soil, in others again red soil or clay.

Water power can be had anywhere almost, for driving machinery. For irrigation nothing is required, there being quite sufficient rain for that purpose.

The roads from Oroya in, are very good and kept in good order by Government.

NOTES.

Calcutta Tea Sales. On 6th instant 12,600 packages were sold, 2,600 having been subsequently added to the quantity originally offered. There was good competition, without much change in the prices.

Ceylon Tea Exports. The Secretary of the Chamber of Commerce, Colombo, gives the following figures:—

January shipments.... ... 6,750,000 lbs.
February estimate 7,500,000 to 8,000,000 lbs.

The Packing of Tea Seed. Charred bran is said to be an excellent medium for packing tea seed. It is used largely for preserving delicate fruit on the way to market, also for packing perishable and other fruits for storage and transportation.

Sales of Coffee in India. Commenting on the proposal to start a Company on the Nilgiris for the direct supply of pure coffee, the Kumaon correspondent of the *Planter* says:—"I am much mistaken if Northern India and the Punjab did not respond liberally to a first class pure article at moderate price."

The Mazawatte Tea Company. Subject to audit, the profits of the Mazawatte Tea Company, Limited, for the last year amounted to £60,240, and the directors recommend a dividend on the ordinary shares at the rate of 8 per cent. per annum, making with the interim dividend 8 per cent. for the year, placing £15,000 to reserve, and carrying forward about £3,000.

Coffee in the Wynaad. A correspondent writes that coffee crops, which ripened, generally speaking, two or three weeks later than usual, have proved to be the finest known during the present decade, more than one "bumper" being recorded, while the quality of the crop and its out-turn on the coast have been most satisfactory. There is also promise of a heavy yield this year, provided the blossoming showers are propitious.

A Calendar. We have to acknowledge receipt of a very showy wall-calendar by the Nilgiri Plantations Company, Limited.—Messrs T. Stanes and Co, Agents. It contains pictures of Lord Wolseley, Lord Roberts, Lord Kitchener, and Lord Charles Beresford, M. P., and is very effectively printed. "British Heroes" is the title and "Three Cheers for the Red, White and Blue" the sentiment.

Coffee in Perak. Sir Græme Elphinstone writes from Perak that coffee prices have driven the Straits planters to other tropical products, many of which find there the necessary conditions for a successful growth. "There is," he remarks; "no doubt that the Native States have a very fine future before them. I may not live to see it, but undoubtedly there will be a successful development of tropical agriculture. More capital and more labor are required, but these will come in time."

Estimates in Ceylon. The estimates of the Northern District Planters' Association, Ceylon, are unusually interesting, as they include for the first time cocoa and cardamom crops for the coming year (approximate) to be secured in 14 districts of the Association alone:—Cocoa 15,825 acres 36,346 cwt., cardamoms acreage 2,956 planted, 2,406 in bearing, yield 345,900 lbs. Tea 39,520 acres and 15,370,000 lbs., against 15,568,650 lbs. last year.

The London Tea Market. Messrs. Gow, Wilson and Stanton's Telegraphic report of 2nd inst. must have been a bit of a surprise to Ceylon planters. It reported a steady market, with Pekoes for price *dearer*, but the average was only 8*d*. which shows a fall of ¼*d*. Of 27,000 packages offered 26,000 were sold. Stock was 18,000,000 lbs. an increase of 1,000,000 lbs. Indian teas showed up better, as the average was 9½*d*. (¼*d*. up). Stock 61,700,000 lbs., which shows an increase of 500,000 lbs.

"The oldest Inhabitant." The *Times of Ceylon* believes that Mr. J. L. Dewar holds the record among Ceylon Superintendents for the continuous management of one plantation or group. He has just given up the management of Roseneath and Anniewatte, after a continuous charge extending over 33 years! This is very nearly approached by Mr. A. Orchard, who has been for 30 years Manager of the valuable Wiharagalla property in Haputale. He may yet establish a new record, as Mr. Dewar has now taken over charge of his own property in the Knuckles.

Colombo Tea Sales. At the public sale of tea at Colombo on 1st instant about 6,420 pkgs. = 405,975 lbs. were offered, of which about 5,597 pkgs. = 341,798 lbs. were sold. The *Times of Ceylon* remarks:—To-day's sale was a comparatively small one and prices all round were very firm, keen competition being noticeable throughout. Common kinds showed a distinct advance of 1 or 2 cents Among the finest teas in the sale were: Agra Ouvah, Glasgow, and High Forest; among low grown teas good invoices were offered from Clyde, Glencorse, and Rayigam.

Coffee Pests and diseases in Queensland. The slug-caterpillar (*limacocidæ*) leaf miner (*?Cemiostoma*), white scale (*Pulvinaria sp.*) stem gridler and seed weevil (*bruchidæ*) are mentioned as pests affecting coffee in Queensland; and the following diseases, &c., attack the plant:—fungus disease of berry; root rot; leaf spot (caused by an undetermined fungus); injury through submergence; and disease related to the Indian Kelroga (caused by *Pellicularia sp.*). So far Queensland is free from *Hemileai vastatrix*.

Worse than the San Jose Scale. A Hartford Co (Conn) writer says that more damage has been done to orchardists by the codling moth than ever has been or will be done by the San José Scale. The moth has been responsible for a high percentage of damaged fruit which has sold for low prices and has greatly injured the market, but the moth does not kill the trees, and hence the most of farmers let it alone to continue the damage. The San José scale kills the tree, and therefore fruit farmers will be compelled to fight it and keep it in check. Hence the amount of damage will be limited.

A Market for Cinchona Seed. The *Ceylon Observer* remarks that there is now a demand for Cinchona seed in Ceylon, and a good chance is offered of getting fine seed from the Nilgiris, from trees the bark of which gives 6·59 per cent. of sulphate of quinine—according to a certificate it has seen. A correspondent writes:—"I never saw finer cinchona in my life and hope to send you a photo soon. Meantime I enclose the last analysis, which please return. Some of the trees are 30 years old and a few give about 30 lbs. of renewed shavings every year!"

The Passara P. A., Ceylon. The Annual Report of the Passara Planters' Association, Ceylon, states that the Tea estimate for 1899 is 3,044,000 lb. with 7,700 acres in bearing and 2,220 not in bearing. This gives an average of just about 400 lb. per acre, which speaks well for the climate and general suitability of the district as a tea-growing locality. The crop of cacao for the year has not been so favorable as might have been expected, but the trees are in good heart and there is every prospect of very good crops for the coming year. The young clearings of this valuable product are most promising and the ravages of the disease on the older fields have been very slight.

Tea in Calcutta and London. Prices in Calcutta have had a nasty fall. After touching 5 as. 11 p. and standing for some time before that at 5 as. 8 p. the average dropped at the end of January to 5 as. 1 p. Fortunately, London rates do not tend the same way. Indeed, recent advices say that the improvement in the tea market continues steady, and the Board of Trade returns show expansion both in exports and home consumption during the past year. In Ceylon tea 3¾ million pounds less have been sent to London during 1898, than in 1897, while foreign trade is developing steadily. Altogether, things look very encouraging for the present year.

Coffee in Paraguay. The *American Grocer* remarks that Paraguay seems well adapted to the production of coffee—not only for consumption in South America, but for export to foreign markets. Among the varieties already grown is the Yungas, which, it is claimed, can compete with the best kinds known to commerce. The berry is well developed, is of fine aroma, green-yellow in color, and in size and weight resembling Mocha. Coffee plantations have existed in Paraguay for many years, but the plants receive little attention, the main reliance being upon the climate. The land is well suited for coffee production, being damp, level, and easy to cultivate.

Ceylon Tea Shipments. The tea shipments to the United Kingdom and to the Australian Colonies from January 1st to February 1st, 1899, were as follows:—

To United Kingdom.

	lbs.
Total export, Jan. 1st to Feb. 1st ..	8,438,000
At same period last year	9,406,000

To Australia and New Zealand.

Total export, Jan. 1st to Feb. 1st ...	1,125,500
At same period last year	1,385,900

These figures show a falling-off to the United Kingdom of 968,000 lbs., and to Australia and New Zealand of 260,400 lbs.

The Agri-Horticultural Society of Madras. Mr. J. M. Gleeson, Superintendent of the Agri-Horticultural Gardens, Madras, has compiled an excellent Catalogue of the Trees, Shrubs and Herbaceous Plants in the Gardens of the Agri-Horticultural Society of Madras and in the neighbourhood. Vernacular and trivial English names have been inserted, the former being intentionally given in a sort of phonetic transcript of the nomenclature of the Native *mali*. The lists are very carefully arranged, and

a very comprehensive index facilitates ready reference. To all amateur gardeners and all who take an interest in plant-life, this little publication will be of great service; and the printers, Messrs. Higginbotham & Co., have made it as clear and attractive as it is useful.

Ramie Fibre: A New Company.

The China Trading and Ramie Syndicate, Limited, was registered on January 3, by Foss and Ledsam, 5, Fenchurch-street, E. C., with a capital of £100,000 in £1 shares. Object, to adopt and carry into effect an agreement made between H. C. Bennertz of the one part and this company of the other part, for the acquisition of a secret process relating to the manufacture of yarn by the degumming of ramie or China grass or other like materials, to develop and work the same, and to open stores in the treaty ports and elsewhere in China and Corea. The first directors—of whom there shall be not less than three nor more than seven—are to be elected by the signatories Qualification, 250 shares. Remuneration, £100 per annum each: chairman, £150. Managing Director, H. C. Bennertz.

Coffee Adulteration.

The *Times of Ceylon* offers a word to the wise, remarking:—The days have long gone by when local Planters' Associations took an interest in the question of coffee adulteration, though the time was when it was a burning question out here, and the home Government was approached on the subject. But, at the late Mr. Gladstone's instigation, protection for Ceylon coffee-growers was refused in the sacred name of Free Trade. Our South Indian friends are travelling the old journey, however, for we see that at Ooty, on the 27th ultimo, the Nilgiri Planters resolved to ask the United Planters' Association to petition the Home Government for more stringent legislation against the adulteration of coffee, and to endeavour to unite the coffee-producing countries of the world in support of the movement, and in pressing it upon their respective Governments.

Tea in the Dooars and Kurseong.

The *I. P. G.* remarks that a member of its staff was in the Dooars and Kurseong a few days ago, and was astonished to learn the views of tea planters in those parts. One of these gentlemen told him that the Muttigurah Tea Estate, which recently changed hands for Rs.3,300, and directly afterwards for Rs.7,000 (without the forest area) was worth Rs. 20,000 to anyone with a capacity for working it successfully; that even if every tea bush was uprooted and the leaves ploughed into the soil, and the whole area leased out to native cultivators at Rs.5 per acre for the raising of ordinary field crops, the owner could have recovered his entire outlay in one year! Further, that a scare seems to have set in regarding tea gardens, with the result that tea estates were going now for the proverbial "mere song."

Phylloxera defeated.

It has been reported to the Academy of Science, at Paris, by M. Dubois, that he has succeeded in discovering a micro-organism which kills phylloxera and kindred pests. The bodies of the insects so killed contained when inspected a great many bacteria; but the poisonous qualities of the organisms seem to differ according to the nature of the soil and the weather. Dubois placed two roots of vines containing phylloxera upon blotting-paper, and sowed bacteria on to them. Eight other roots he put into vessels filled with earth, and sowed bacteria on these also. After two days all the phylloxera were dea on the two roots on the blotting-paper; after five days o the eight roots; while those two roots which had not receive any bacteria had plenty of living phylloxera on them Others could also detect bacteria within the bodies of th dead phylloxera in some instances.

Structure of a Flower.

Under the laws of morphology complete flower is but modified leaf blade and branch. If we can imagine a long coil of wir drawn in so close that the spirals touch each other, we ma form some idea how Nature draws in the longitudinal growt of a branch to form a flower. At times the branch objects t this summary proceeding, and, after being arrested and eve the parts of the flower formed, will escape from the bondag and journey on as a well-ordered branch should. A branc of a Moss Rose that has fought for freedom in this way wa sent to *Meehan's Monthly* some time ago A few good, clea petals had been formed, when the whole central portion start ed off on its journey as a perfect branch again. Those wh have sharp eyes occasionally meet instances of this behaviou in the Rose and other plants. These departures are ver instructive to the curious in the secrets of Nature.

Coffee in South Sylhet.

A correspondent writes to th *Planter*:—"There would seem to b many more people growing coffee for their own consumptio in Sylhet and Cachar than I have been aware of. A lette from a planter with whom I am slightly acquainted inform me that he planted 100 of the Arabian variety eight year ago, and that they grew splendidly, and gave a tremendou crop in their 3rd year, and then died right out. He ha been informed that coffee always did this when growing at a low elevation. He, however, had a few coffee seeds present ed to him and he tried it again, and was advised by a frien to strip all the maiden crop off the primaries, because whe coffee was growing at a low elevation it was very apt t overbear itself before the plant had reached maturity. H did this and has now fine large bushes five years old whic bore a heavy crop last year, and at the present time ar covered with white tipped flower buds."

Vanilla.

Messrs. George Lueders and Co report the 1897-98 crop of vanilla bourbon as follows:

	Pounds.
Bourbons	275,000
Seychelles and Mayottes	65,000
Madagascar, Mauritius, Comores	55,000
Total	395,000

The expectations for next crop are far below this figure

	Pounds.
Bourbons	175,000
Seychelles and Mayottes	50,000
Madagascar, Mauritius, Comores	30,000
Total	255,000

Considering that the Mexican crop is stated to be 30 to 4 per cent. short, an advance in prices all along the line may safely be predicted.

Renewing Old Seed.

Very interesting experiments are being conducted at the Amhers (Mass) experiment station in bringing to life seeds which are too old to sprout well. It is hoped that tests will eventually lea

to results of great commercial value. Old seeds have been treated with a 2 per cent. solution of asparagin, a vegetable extract obtained from German chemists, and the result has been to increase the germinating power greatly. Seed which before treatment showed only 50 per cent. of germination with one-half worthless, after treatment showed 98 per cent. of germination and only 2 per cent. which failed to sprout. Since asparagin at present costs $1.50 per ounce, the method is not profitable for ordinary seeds. But seeds of new varieties and certain flower seeds which are actually quoted at more than their weight in gold might be treated this way with profit. Experimenters are in hopes of finding a cheaper substance or a cheaper way of making this article for treating the seeds.

Trout Ova, &c., in Ceylon.

The Hon Secretary of the Ceylon Fishing Club, Nuwara Eliya, reports that the first consignment of trout ova has been up to the average. Everything seemed to be against it: the eggs looked unsatisfactory when opened, and apparently had not been sufficiently iced on board, and ever since they were put into the trays the most unfortunate weather has prevailed: perpetual rain, and muddy water at a high temperature. Nevertheless the eggs have done far better than was expected, and 7,000 alevins have been hatched out, and seem lively and prosperous. But for the heat of the water and the muddy sediment there would probably have been 10,000. The Club has had to give up the idea of grayling, owing to the impossibility of getting the ova out before the middle of April; but 12,000 Rainbow trout ova are expected early in March, in addition to the second consignment of ordinary trout ova (20,000) which are due by the middle of next month. The first experiment in Gourami has proved a failure. The fish shipped were apparently full-grown, and only three arrived alive at Colombo.

Tea Cigarettes: What next?

The "Medical Press and Circular" seems to hint that the latest fashionable wickedness is to take one's tea in the form of cigarettes. Judging, however, from what our medical contemporary says of the vice, it hardly seems likely to become general. The first sensation, it appears, though peculiar, is not as unpleasant as might be supposed, but this condition of qualified beatitude does not last long. Then comes "a thickening of the head, and a disposition to take hold of something or to sit down." If the novice perseveres he—or she—may be next rewarded with a feeling of exhilaration, intense but of very brief duration. But the after-effects, our contemporary solemnly avers, are too dreadful for contemplation—even by a medical commentator—and it takes many hours before the beginner even begins to revive. A dustpan and a broom seem to be the only things then required for removing the smoker.

Insect-Destroying Plants.

Physianthus albens is a moth-catching plant. The former United States consul at Auckland became much interested in the cultivation of the different species of Physianthus and trained them up the trunks of the apple trees with the idea that the flowers would catch the codlin moths. Large numbers of the moths thus caught were sent to the United State entomologist, L. O. Howard, and were carefully examined. There were many noctuids and pyralids among them, all undoubtedly more or less injurious in the larval state, but no codlin moths. The plant is undoubtedly of value in the way of capturing injurious insects, but this value has been exaggerated. No doubt the majority of moths caught in this way are either males, or females which have already laid their eggs. The action of the flower is entirely mechanical. The calyx is deep, and the nectar is placed in its base. Attracted by the sight and powerful perfume of the nectar, the moth penetrates into the calyx and pushes forward its proboscis to get the food, but before it is able to do this it is seized between two lips or jaws that guard the entrance and kept a prisoner until it dies.

Fine plucking.

On the subject of fine plucking, one planter has been emphatic in the expression of his views to a representative of the *Indian Planters' Gazette*. He thought that for the next two seasons "two leaves and a bud" should be the order of the day; and that every scrap of Souchong should be burnt and destroyed, rather than overstock the market. "Starve the London market," he said, "and you will soon have Indian tea prices going up with a bound." Asked if he meant by that remark that teas should in future be sold in the Calcutta market in preference to London, he said: Oh, no! I mean that the plucking should be limited to Pekoes and 'teas for price,' and in this way the supply of our teas to the London market would be kept down, the result of which would, I believe, be to run up prices; at any rate we should not then have the stereotyped descriptions to which we have become accustomed during the past season. In a word, we should make it our business to aim at quality rather than quantity. I am, of course, speaking of the Dooars and Terai gardens. In Darjeeling they cannot very well go in for quantity, seeing that their tea bushes rarely attain a height of two feet. Even in our Terai gardens the bushes seldom attain larger dimensions—nothing like the Cachar and Sylhet bushes." From all this, remarks our contemporary, "it may be inferred that matters are not exactly as they ought to be. Our representative suggested 'auxiliary crops,' but the suggestion was received with silence."

How to Treat Bones.

The following information regarding farm methods of treating bones, where no crushing-mill is available, has been furnished, in a reply to a query from a correspondent to a Melbourne paper, by Mr. A. N. Pearson, the Victorian Government Agricultural Chemist:—Bones in country districts, where crushing-mills are not available, may be reduced by means of caustic, lye, quicklime, or freshly calcined wood ashes. A simple plan is to pack the bones layer by layer, with freshly calcined

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50 lbs. Nitrogen.	14·92 lbs. Lime.
57·38 „ Potash.	13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE.
Shencottah.

wood ashes, in a barrel, and keep the mixture moistened for some months. Casks may be kept in constant use for this purpose on a farm, receiving every few days a fresh layer of bones and of ashes. A quicker method is to boil the bones in an iron or copper boiler together with a strong caustic lye. The proportions of bones and lye to be used are not exact or invariable. Roughly speaking, five parts by weight of caustic soda, or seven parts by weight of caustic potash, dissolved in fifteen parts by weight of water, should disintegrate about fifteen parts by weight of bones by two or three hours' boiling. If the bones be allowed to remain in the caustic liquor, even without boiling, they will, in the course of a week or so, become disintegrated. Another method of softening bones is by mixing in heaps with quicklime and loam. A layer of loam 4 inches deep is made, and on this is placed a layer about 6 inches deep of bones, and above this is a layer 3 inches deep of quicklime. The layers of loam, bones, and lime are repeated in succession until the heap reaches a convenient height, when it is finally covered with a thick layer of earth. Holes are then bored in the heap from the top, and water poured down them to slake the lime. The mass will become hot, and remain so for two or three months, after which the bones will be friable, and the whole heap may be mixed up, and is ready for the ground.

LETTERS TO THE EDITOR.

LONDON INDIGO ASSOCIATION.

TO THE EDITOR OF *Planting Opinion.*

SIR,—The attention of the Committee of the London Indigo Association, has been called to articles which have appeared in various Indian newspapers, putting forward the view, that Indigo is more or less rapidly going out of consumption, its place being taken by substitutes, and that consequently the profitable cultivation of Indigo in India must be looked upon as a thing of the past.

These statements will naturally have appeared very alarming to Planters both European and Native, and we have therefore been requested to point out how little foundation there is for them.

So far from there having been any reduction in the consumption during the last 12 months, all the most reliable statistics procurable, shew a distinct increase. Taking the statistics for England, which is the largest consuming country in the world, we find—

Deliveries to the Home Trade in 1898	10,041 chests.	
Do do. do. 1897	9,145 do	
Shewing an increase of	902 chests, or, say, 9 per cent.	

That, however, does not shew the whole difference, as the Home Trade took 1,718 chests more BENGAL and OUDE in 1898 than in 1897, which, allowing for the heavier chests and higher percentage of colouring matter in BENGALS, would make the increased consumption equivalent to at least 1,500 chests, or, say, 15 per cent or more.

If equally reliable statistics were obtainable from Continental markets, we have every reason to believe that a more or less similar result would be shewn.

According to the most reliable information, not only is the so-called substitute quite unsuitable for the most important purposes for which real Indigo is used, but the cost also, debars it from being very seriously in competition. We have had before us a properly authenticated statement shewing the result of experiments made on an extended scale and under careful supervision; it establishes clearly that there is a difference, at present prices, of over 40 per cent. in favour of real Indigo, which is a difference that no consumer can afford to ignore.

In conclusion we can assure our planting friends that the position of Indigo is not so much jeopardised as has been represented, and, so far from there being any reason for Planters to give up, or seriously reduce their cultivation, we believe that what is most wanted to give increased stability to the article, is good crops and moderate prices. By "moderate" we do not mean such abnormally low prices as have ruled of late, which must have been very discouraging to producers. An advance of 6*d* per lb. on present rates would still leave prices moderate, and yet give a fair return to growers. We enclose statement of London Stocks and Deliveries for 1898, which, we think, will fully confirm the views we have expressed above.

We are, Sir,
Yours faithfully,
On behalf of the Committee,

F. P. BROWN,
Secretary,
LONDON INDIGO ASSOCIATION,
38, Mincing Lane,
London.

LONDON, *20th January, 1899.*

GENERAL ARTICLES.

THE POLICY OF ABANDONMENT.

MR. ROBERT H ELLIOT, of Mysore, writes to the *Ceylon Observer*:—Since writing to you, on January 25th, a letter which you were good enough to publish in the *Observer* of Jan. 30th, I have received letters on the subject from Ceylon Planters of past experience and am now more than ever convinced that the policy of judiciously abandoning unprofitably or only slightly profitable portions of estates is really the only course open to us in order to diminish, as far as possible, the results of the disastrous Currency policy of the Indian Government. For what hope can there be of turning the Government from its course? - a Government which practically consists of Indian officials, who want to get their savings remitted home on the most favorable terms. They started the movement and they will certainly persevere with it to the end, and while they have all the power of the Indian Government, at home and in India, at their back,—we have merely the purely nominal power of the House of Commons, the members of which, with but very few exceptions, neither know nor care anything about the subject.

Then so far from having any security that the officials will content themselves with a 16d Rupee, we have the Government (*vide* Sir David Barbour's speech of June 26, 1893) assurance merely that "it is not attended to do more *at present*" than aim at this rate. A higher rate then is evidently determined on, and what that may be no one can tell; and even if the existing officials were contented with a moderate further rise, it by no means follows that their successors may not aim at a much higher rate. The whole situation in short bristles with uncertainty so far as the Currency is concerned, and it is therefore evident that we must betake ourselves to our only certain refuge—judiciously abandoning every acre we can, and there by reducing production, labourers' wages, labourers' advances, and the risks of the season, which of course, are far less on rich, sheltered lands than on the poorer and more exposed portions of estates.

FIRE AT A TRAVANCORE TEA FACTORY.

A correspondent of the *Western Star* sends the following particulars of a serious fire that recently occurred at the Poonmudi a Tea Factory :—

On Sunday morning the 22nd ultimo, at about 8 o'clock, we were startled by a sudden outbreak of fire, at the Poonmudi Tea Factory. The work was going on as usual, and Mr. Ross, who was in charge of the Estate in Mr. Valentine's absence, being on the spot. The Factory is a very large two storeyed building. The top was used for withering the leaf, and the bottom or ground floor, contained the Engines, and all the usual machinery for the manufacture of tea. The strange part of the affair is that the fire broke out, not on the Engine side, but on the opposite end upstairs, where it could not be at once noticed by the workmen, all of whom were engaged on the ground floor, and even now, nobody is sure, of the exact spot where it first commenced. It was only after the fire had taken a firm hold, that it was noticed, and the alarm sounded. Mr. Ross, who was then in the office, rushed to the place, only to find dense volumes of smoke issuing from the building. Buckets for water, and a large number of coolies were without a moment's delay set at work, but unfortunately, owing to a strong wind that was blowing at the time, the fire spread rapidly, and the whole building was a huge blaze in a few minutes. Notwithstanding the greatest exertion on Mr. Ross' part, with a large number of coolies and subordinates and enormous quantities of water, it was not found possible to save practically anything more than the Engines, and a part of the room in which they stand. It is a sad sight to see doors and windows and every bit of woodwork of so large a building reduced to ashes, and machinery, &c., damaged beyond repair. All that is now left of the building, is some stone work on the ground floor

I understand that, the damage is estimated at 50,000 rupees, for which amount, I believe, the building is fully insured Great sympathy is felt for Mr. Valentine and Mr. Ross in the sad disaster, and it will take months before this fine Factory and machinery can be restored.

GINGER.

The *London Commercial Record* says :—We have lately been frequently asked what views we entertain regarding the future of Ginger, and to state if possible some details as to crop prospects and condition of trade in India. In compliance with these requests we regret that we cannot draw as rosy a picture as we should like, but the position of the article does not warrant it. This year, the same as in former ones, an attempt has been made to raise the value of Ginger in our market, but so far the attempt has been a failure, although it had the hearty support of Indian speculators. The heavy stocks acted as dampers and prevented effectively the spreading of the enthusiasm which some operators possessed and tried to create in others The transactions which resulted were thus confined to a limited quantity, and came to an abrupt end the moment 24s. c.i.f. for usual assortment Calicut was touched. Prices had gradually been driven up for cut assortment from 21s 6d. c i.f. to 27s. c.i.f., but no business resulted as far as we can ascertain at the lowest figure. Small quantities of special sizes also changed hands, and at one time arrival contracts excited so much interest in certain quarters that a boom seemed quite within the reach of possibility, but the dull and stagnant spot market cut short all hopes for an improvement. C.i.f values as compared to spot prices showed no margin, and no speculator was daring enough to pay a premium in anticipation of an early rise in the value of available Ginger, and the movement died a natural death. A standstill in the upward tendency of a speculative market, artificially inflated, is always fatal, and it has proved itself to be so in this case, for when the few outside operators ceased to evince further interest in the article over 27s. c.i.f., holders became uneasy and nervous, and soon began pressing their purchases for sale, with the result that prices steadily gave way without effecting the much-desired sales London antipathy to deal had a cooling influence on Indian operators, who now are slowly climbing down from their extravagant ideas; 23s. 6d. c.i.f. would readily buy assortment to-day, but, the lower India goes, the less inclined will London be to purchase until a perfectly safe basis be reached. Last year we started operations practically at 19s per cwt. c.i.f. for usual assortment and, although we do not anticipate such an exceptionally low price again, we should think that purchases in the neighbourhood of 23s. to 24s. c.i.f. should form a sound basis for a bull operation. There is no longer any doubt about the yield of this season's crop, it is short, in Cochin as well as in Calicut, and, as a large portion of it has alreadybeen bought up by Natives—who had a little gamble in rough descriptions among themselves—the available total in India for export to Europe cannot possibly be very great. Should London operators a little later feel disposed of taking Ginger up, they will stand an excellent chance of making money, but it will be advisable to wait for a time when prices in India have been forced down to the indicated level by larger arrivals and slackness of demand in London. At the present moment Natives are holding supplies back in the hope of creating thereby an increased demand: they will change their tactics, however, quickly enough when they observe that we are utterly indifferent to their manœuvres. Then is the time to buy, for spot values by then will have improved, and a spurt, such as we have seen every year, will be possible on a healthy and sound basis.

ATTAR OF ROSES.

In our last we gave a note of a somewhat primitive and slow method of manufacturing Attar of Roses, with the assistance of the sun. We now give a few remarks of a more modern character, which should be of use to anyone who thinks of starting the distillation of Attar of Roses:

This delightful perfume is procured from several species of rose, but most commonly from the *Rosa centifolia provincialis* and *damascena*.

Chemically speaking, otto or attar of roses is a mixture of two bodies, one a solid, non-odorous, white stearoptene, melting at 95 degrees F., and boiling at 300 degrees F., constituting from 7 to 14 per cent. of the whole; the other, the odorous portion, being a yellowish liquid hydrocarbon of undetermined constitution. The stearoptene is readily soluble in the liquid portion, from which it may easily be separated by cooling.

The rose is extensively cultivated in Turkey, Bulgaria, Roumelia, and France; the three first named countries producing the distilled otto or attar of roses, and the last named mostly producing the fine rose pomade by the maceration process.

In 1887 Bulgaria produced 57,868 oz. of otto of roses, valued at, when pure, from 25s. to 30s per oz.

In the year 1888 Roumelia produced 90,750 oz. of otto of roses, so that the rose farms in that country may be said to represent an annual value of from £113.000 to £136,000. As the present value of otto of roses is about 40s. per oz. these figures are subject to enlargement.

At Adrianople, in Turkey, some 12.000 to 14,000 acres are under roses supplying the most important source of wealth in the district.

An average crop generally returns about £15 per acre, clear of all expenses, and in a favourable season this return may reach as high as £25.

Otto of roses is largely adulterated by the addition of geranium oil, the presence of which is easily discovered from the brownish tint, resulting from the addition of a little iodine.

The distilling apparatus used in Bulgaria is a very simple affair, consisting of an elongated copper boiler, in the shape of a truncated cone, surmounted by a narrower neck, upon which is fitted a peculiar dome-shaped head, having very much the appearance of a half opened mushroom. Into this head is fitted a straight tin condensing tube at an angle of about 45 degrees with the vertical. This tube passes through a cask, into which a supply of cool water is admitted to effect condensation. No worm or coil is used as in an ordinary still. The peculiar dome-shaped head of the still probably allows of the use of such a restricted cooling tube, as the steam passing through the narrow neck of the boiler would, on entering the head, expand a good deal, and, by so doing, be more readily condensed.

The capacity of the still is generally 24 gallons, and each charge consists of 22 lb. of roses to 16½ gallons of water.

The still is generally placed on a built furnace of brick or stone, fitted with a central chamber and flue to carry off smoke. When distilling, the water in the boiler is brought rapidly to boiling

point, the temperature being then carefully moderated and regulated by withdrawing the long pieces of wood used for fuel. The operation lasts about an hour and a-half, and is stopped when 9 quarts of liquid have been collected in the receiving vessel. The still is then recharged after being emptied of its contents, the refuse water being set aside to cool for use a second time. The product of four first distillations is returned to the still, and from the 9 gallons, only 9 pints are drawn off and put on one side to cool, when the oil separates from the wayer and is drawn off.

In France the rose is cultivated in a very simple manner. The land is manured and ploughed, rooted rose plants being placed in the ground at distances of 2 feet apart and 5 feet from row to row. Each root before planting is cut back to two or three buds. In the fourth year the plants are fully developed, and when well cared for last about seven years. In an average season the product of an acre is about 2 tons of flowers, valued at from 3d. to 6d per lb. It required about 1000 lb of roses to perfume 1 lb. of fat by the maceration process.

VARIETIES OF COFFEE.

The 1897 report of the Superintendent of the Royal Botanic Gardens, Trinidad, contains interesting remarks on Coffee, which treat of several varieties of the plant. We quote as follows:—

Plants of **Coffea arabica** have been in demand, but there is little disposition at present among the planters to regard them as valuable Charges at the rate of one half-penny per plant are considered too high, and many use plants dug up from under growing trees (rat-planted coffee) in preference to our nursery plants, simply because they can be obtained at a cheaper rate. In countries where coffee is scientifically grown, such procedure is strongly condemned, and very rightly so. I know estates in Central America where all the plants are not only raised in the nurseries, but they are trained there for two or three years, until considered to possess sufficient vigour to stand the hardships of the field, and all weakly and inferior plants are rejected. The value of practice is seen, when the observer notices what a high place is accorded on the markets to Costa Rican and Nicaraguan coffee.

Liberian coffee has been in more demand for the neighbouring island of Grenada, than for Trinidad, although it grows here rapidly into small trees and fruits abundantly, an illustration of the fact, that it is not as yet considered a good enough "minor product" by the Trinidad planting community. In the Dutch Colony of Surinam, however, Liberian coffee is being largely planted, some estates having as much as 250 acres in a bearing condition Trinidad might very well grow Liberian coffee to the value of many thousand pounds per annum, as there are thousands of acres of land available, and admirably suited for this crop. There are minor difficulties in the way, no doubt, such as the general want of knowledge among the labouring class of the methods of harvesting and preparing for market; but these would, I believe, entirely disappear, if the culture was generally and earnestly taken up. Large quantities of Liberian coffee plants were sold in my predecessor's time to private buyers in Jamaica, and to many in the other islands, soon after its introduction in 1875; so that it cannot be said that plants have not been available and yet in Trinidad few trees have been planted except in a desultory and careless manner by the side of, or under the crops or in out-of-the-way corners where nothing else could be got to grow.

Another competitor for public favour has proved itself this year under the name of **Coffea stenophylla,** Don.-or hard-leaved coffee. This coffee grows freely but is not in any way so robust as Liberian but has more of the character of growth of the Arabian although it is decidedly distinct from the latter Our trees four years old are some eight feet in height and beautifully furnished with branches from the ground upwards Though fruiting for this year for the first time, it gives promise of becoming an abundant bearer, and its produce is of a quality to take its place at once upon the markets as a first-class coffee of the Mocha type of bean. The "cherry" is small and of a deep purple colour when ripe, not red like the Arabian The beans are small and roundish, less in size than the Arabian, but when in the parchment are clean and smooth like the seeds of that species, and the parchment is readily removed. The beans are small and roundish. less in size than the Arabian, but when in the parchment are clean and smooth like the seeds of that species and the parchment is readily removed The flavour of the coffee when roasted and ground is of a very high order.

A fair crop of seed produced during 1897, has enabled the foregoing observations to be made, but a further series will of course be necessary before the question can be decided whether **Coffea Stenophylla** will be a profitable crop to grow or not.

All that can be said at present is, that in growth, in crop, in quality and in facility for preparation it promises to prove a plant of the best class for cultivation in the West Indies.

There is in the gardens also a variety of the Arabian known hitherto as "Narrow-leaf coffee." This coffee has been on trial for some years but until lately it was not possible to carry out suitable observations. It can now be recorded after observations made during the past three seasons, on young plants specially grown for the purpose, that it is an abundant bearer, producing beans of fine size, and of the highest class

A variety called "Hybrid Mocha" by Mr. Prestoe, does not appear to be anything more than a prolific variety of the ordinary Arabian.

Under no circumstances could it be a hybrid, as the Mocha itself is nothing more than a variety of the well known Arabian. Whatever its origin may have been - and it appears to be involved in no little amount of uncertainty—it is still however a variety of coffee of the quality and deserving of a place on every estate. Our little experiment ground for Arabian coffee is covered with about 50 trees which have been, like Cook's tours, "personally conducted." The result has been to show that coffee when properly treated grows and fruits well, and can be profitably grown at an elevation little above sea level in Trinidad. It should however be pointed out that our soil is a dry one, and our position is some 130 to 150 feet above sea.

Abbeokuta Coffee—This is a coffee that has been sent to us from the Royal Gardens, Kew. It is an African coffee, and has much the appearance of the Liberian, but it is too early to say or to estimate what it will turn out to be like.

Maragogipe Coffee.—This variety of coffee grows well in the gardens and yields fairly well, but so far it does not compare with the ordinary varieties for productiveness. It is a Brazilian of coffee arabica.

Mexican Coffee.—Coffee arabica var. Mexican, a is a coffee which promises to be a very prolific variety.

I am glad to be able to report that so far. the coffee disease of Ceylon has not made its appearance in Trinidad, and we suffer from little else than the common Cercospora coffeciola, which does but little harm, except to young plants.

THE BRAZILIAN COFFEE POSITION.

In their latest report on the Brazilian coffee position, Messrs. W. H Crossman and Brother complain bitterly that. "notwithstanding the fact that their reports and figures during the past three years have been absolutely absurd, the Brazilians continue sending forward just as erroneous reports, with the only difference that they cloak them with the dignity of boards of trade, associations of dealers, a d commissions of one sort or another. They have never concerned themselves to correct, later on, when any of their early estimates and reports have been proven to be entirely wrong; but they go on with predictions for the future—if anything more sensational and biased than ever. They are doubtless encouraged in this by the large holders in consuming countries, who welcome any information in the direction of damage to the crops small estimates, and so forth; for if it fail in effect with the more experienced coffee dealers, the hope is still held that such reports may be believed by outside speculators and interior buyers."

Proceeding. Messrs. Crossman state that "the three consecutive crops in Rio and Santos of 1896-97, 1897-98, and 1898-99 give a total of about 28,000,000 bags. The Rio and Santos crop of 1899-1900 promise to add not less than 10,000,000 bags to these figures, and such an immense quantity will certainly appeal to the most casual observer as something enormous compared with any four coffee crops ever grown. The crop yield during the past three years has been so large that they have been under-estimated —a fault which we have committed as well as others. The reports that we have received at the end of the year from most conservative sources uniformly represent the growing crops in both Rio and

antos in a most excellent condition, and foreshadow a yield the argest ever known. All this, together with the fact that the Brazilians seem to be indifferent as to the gold price which they eceive for their product, as long as they obtain a high price in heir native currency, makes dealings in this staple extremely precarious, and existing and prospective conditions will necessitate ow values for a long time to come.

"The decrease in the visible supply for the world on January 1 f 368,000 bags has failed to have the influence in the market that t otherwise would have done, as the coffee world is well enough ware that this decrease is largely due to the artificial holding ack of receipts during November and December, 1898; and when he month of January shows larger receipts than during November r December, a temporary decrease in the visible supply loses its effect, and is rather a warning that the position is constantly sustained in an artificial manner It may be mentioned that arguments and hopes are put forward by parties favourable to higher prices for coffee that the present abundance of money has brought out speculative propensities in all lines of securities, investments, &c., and while it is known that the same has created higher figures for very doubtful properties, they think that coffee might be included n the list of speculative lines. We would point out, however, that he lower prices ruling for coffee during the past two years have ontributed materially to the abundance of money and prosperity n the country. In panicky times, like the year 1873, and again in 893, coffee values ruled very high; but in better times, such as existed from 1879-80 up to 1885-86, coffee continued to decline, nd the large saving in volume of money paid abroad for coffee stablished a definite relation between low prices for coffee and prosperity in this country, meaning really some $50,000,000 to 60,000,000 a year less sent out of the country for coffee, compared vith the years 1887 to 1896.

"The much-discussed question whether present values are remunerative to the coffee growers in Brazil is," Messrs. Crossman candidly admit, "difficult to determine, when the planters seem to care little or nothing how much gold their country receives, leaving t therefore to the rate of exchange, and the consequent currency or milreis-price they receive. Foreign investors in Brazil plantations who paid gold for their lands naturally demand gold in he payment of interests and dividends, and figure their profit or oss upon the basis their investments cost them. The Dumont Fazenda in Brazil was incorporated many years ago at a high valuation, and did well enough during the period of high coffee prices. . . . The fact that 99 per cent. of the planters in Brazil have no concern for the gold (cost and freight) price, and only look to the amount they can obtain in paper currency value for their crops, would indicate that the question of price at which coffee can be grown with profit is a very difficult one to debate The fact remains that crops continue to be large, with every evidence that the cultivation is still pursued with the greatest vigour; and we do not look for theories while results are so apparent—which are that we are still in the midst of a period of over-production that is certain to continue for a long time to come, and that supply and demand fix the value. Whether same is profitable to the producer, whether agreeable or disastrous to the speculator, one thing is quite certain—the value will follow the natural tendency, the same as it has done in the past."

MANURING OF TROPICAL PLANTS.

(Continued from issue of 28th January 1899.)

B.—ARTIFICIAL FERTILISERS.

All the food-plant ingredients mentioned can be purchased separately in the form of artificial fertilisers, and in an available state, so that the varying needs of different soils and plants may be cared for.

(i). Nitrogenous Fertilisers.

1. Nitrate of soda contains nitrogen in the easily soluble form of nitric acid, which is immediately absorbed by the plant, and is therefore very effective.

2. The nitrogen in sulphate of ammonia is also very soluble, but must be converted into effective nitric acid in the soil; the change goes on quite rapidly in hot climates and calcareous soils, so that the efficacy of sulphate of ammonia is almost equal to that of nitrate soda.

3. The nitrogen in dried blood, horn-meal, wool-dust, &c., must be converted into ammonia by putrefaction, and then into nitric acid; these fertilisers, therefore, act slowly, but their effect is more lasting. To this class belong the above-mentioned oil-cakes, tankage, bone-meal, guano, &c.

As decomposition takes place much more rapidly in tropical regions than in temperate zones, the organic nitrogen supplied is proportionally of greater value, and will yield the best results, especially when applied to plants which, like sugar-cane, coffee, tea, &c., have a long period of growth.

Investigations conducted by Prof. Wagner, of Darmstadt, have shown that nitrogen is most available in the form of nitrates. To illustrate: If the availability of nitrate of soda be taken as 100, then that of various other nitrogenous fertilisers will be as follows:—

Nitrate of soda	100
Sulphate of ammonia	90
Dried blood, horn-meal, oil-cakes in a green (not yet decomposed) state	70
Steamed, finely powdered bone-meal, fish-scrap, tankage	60
Stable-manure	45
Wool-dust	30
Ground leather	20

The above figures may vary somewhat in tropical regions, as the more easily decomposed organic fertilisers are quicker in their action, especially in the case of oil-cakes.

H. C. Prinsen Geerligs has conducted important experiments at the West Java Experiment Station, regarding the conversion of organic nitrogen into ammonia and nitric acid, the results of which are given in the following table:—

From 100 parts of nitrogen contained in the oil-cakes and in sulphate of ammonia were formed in the soil—

PRODUCE AND PLANTING.

More Cheerful.—There has been so much croaking in the Press and elsewhere about the outlook for tea that an article of a hopeful character in the *Scotsman* is very welcome. We reprint it in another column as a proof that there are signs of a return to a more reasonable view of things We find the *Globe* taking up the same strain. It says: "For a long time the Indian and Ceylon tea planters tried in vain to place their goods in the Continental, American, and Australasian markets. While their superior growths drove the Chinese herb out of England, popular taste abroad adhered to the latter. Happily, this is no longer the case; recently published statistics prove that prejudice is rapidly giving way to common-sense. The annual exportation to Australasia in particular is advancing by leaps and bounds. Last year it amounted to 29,000,000 lbs. North America has not yet become nearly such a good customer, but her consumption has risen to 8,000,000lbs. while the Continent absorbs over 12,000,000lbs. Altogether the exports to foreign countries other than Great Britain now amount to 58,000,000lbs. and although this is small compared with the British consumption—last year's was 231,000,000lbs.—it represents a wonderful expansion to have taken place so quickly. But popular taste still has its vagaries. While Australasia, the Continent, and Canada give decided preference to Ceylon growths, the United States have greater relish for the Indian. But this is of little importance; the gratifying fact is that the joint exports to these new customers should have very nearly doubled during the last three years. The planters are thus rid of the misgiving that over-production might precipitate a ruinous fall of prices After the British demand is satisfied, 40,000,000lbs. still remain to be disposed of, but now that 58,000,000lbs. are required for new markets, demand must be in excess of supply just at present No doubt increased production will soon redress the balance."

The Tea Trade of China.—Professor Douglas, in his lecture on China, referred to in another column, deplored the loss to China of its tea trade. He has good reason to call it a "great misfortune" for the Celestials. In 1878, out of a total of about 157 million lbs. used, under 37 million, or, say, 23½ per cent., came from India and Ceylon. In 1898 our consumption had risen to 231¼ million lbs. and of this 9 ¼ per cent. was of Indian and Ceylon origin. China tea, as everyone connected with the tea trade knows, is in a very bad way indeed, so far as this market is concerned, and as Professor Douglas says, the growers in China have realised it, and are striving to remedy it, although somewhat late in the day.

Last Week's Tea Market.—"The tendency of the market for Indian teas," says the *Produce Markets Review*, referring to last week's sales, "has been exceptionally strong, and a general advance from ¼d to ¾d has taken place, notwithstanding the heavier supply brought forward. The principal upward movement has been in the medium and fine grades, most of the direct garden consignments showing the greatest rise These descriptions, which were obtainable at unusually favourable prices during the two or three months before Christmas, are, even at the advance, still good value as compared with other growths. There appears to be every prospect of prices being maintained, and it is not improbable that a further advance may be seen later on, as the future supplies of these kinds are by no means likely to exceed the consumption. For the commoner sorts there has also been an active market, with an enhancement in values of from ¼d to ½d per lb; but, although present rates may be supported, any further material rise in the face of the heavy shipments of these grades is not immediately probable. The finest descriptions, as usual at this period, are getting into a much smaller compass, consequently any parcels which stand out are eagerly bid for at improved rates. This market for Ceylon teas has been better supplied, the quantity brought forward at public sale having shown a large increase on recent auctions. The demand throughout, however, was brisk, the bidding being particularly keen, and full prices were paid generally (except for a few thin liquoring sorts), with a decidedly upward tendency. For the lower grades of leaf tea the inquiry continues good, and there is very little to be bought under 5½d per lb The medium kinds have also been much sought after, but no change can be quoted in these descriptions, although the market remains very firm. In broken Pekoes the selection under 8¼d is still very limited, and values were consequently firm, while the better sorts were more liberally represented, but were readily taken at occasionally enhanced rates."—*H. & C. Mail.*

BRITISH GROWN TEA.

(FROM AN OCCASIONAL CONTRIBUTOR.)

At the opening of another year it cannot but be interesting to your readers to have placed before them the most recent and reliable statistics of the British-grown tea industry.

According to the latest report of the statistical department of the Government of India published, the area under tea throughout India at the end of 1897 is 493.710⅞ acres, but this includes an

NOTHING EQUAL TO THESE IN THE CARNATIC.
[2-10-98—t.f.o.]

estimate of 30,000 acres for Travancore, although in regard to that province it is stated that "the planters were unwilling to furnish information, and the recorded figures are quite unreliable." If we go back to the reports previously issued by the Government of India, it will be found that the total area under plant at end of 1894 was returned as 423,006 acres. and if to this we add the area at which the extensions since 1894 are returned in the last report issued, namely, during 1895, 15,190 acres. 1896 17,396 acres, and during 1897 no less than 6[illegible],430¾ acres, equal in all to 93,016¾ acres since close of 1894, the total area till end of 1897 would come out higher, say, 516,022¾ acres. But no doubt the area returned for Travancore must be treated as entirely unreliable. Though the Government of India has failed to obtain the desired information from the Travancore planters, we learn, through the courtesy of the London office of the Ceylon Association, that Mr. Ferguson, of the *Ceylon Observer*, has succeeded in obtaining returns from every property in Travancore, and in a fully-detailed statement brings out the total area under tea in that State till middle of 1898 at 16,276½ acres. This does not say much for the methods of the Government of India for obtaining complete and trustworthy statistics. It is therefore well that, at the suggestion of Mr. Stanton, of Messrs Gow, Wilson, and Stanton, who may be looked upon as the statistician of the Indian tea industry, the statistics for the Government of India are in future likely to be collected and furnished to it by the Indian Tea Association.

It is much to be regretted, especially at a time like the present, when there is a scare in regard to too rapid extensions and over-production, that the Government of India should magnify the evil (bad enough no doubt) by the issue of unreliable and exaggerated statistics.

The following statements of area are perhaps as accurate as can be obtained without the aid of an expert from each district with an intimate knowledge of it. The figures, for various reasons, should possibly be taken as over rather than under the actual areas

AREA UNDER TEA THROUGHOUT INDIA ACCORDING TO GOVERNMENT. RETURNS FOR 1897.

	Acres.
Assam	178,444
Cachar	61,190
Sylhet	70,200
Darjeeling	55,822
Julpaiguri (Dooars)	65,072
Chittagong	4,024
Hazaribagh and Lohardaga	3,049
Kumaun	3,159
Dehra Dun	4,806
Kangra Valley	9,970
Nilgiris	5,479
Travancore	16,276
Burma	747
Andaman Islands	650
Total	478,888

AREA OF BRITISH-GROWN TEA ACCORDING TO RETURNS FOR 1897.

	Acres.
India	478,888
Ceylon (for 1898)	363,807
Natal	2,302
Fiji	210
Mauritius	100
Straits Settlements (area not known at Colonial Office), say	100
Total	845,407

In regard to India there are small areas under tea in Goalpara, the Naga Hills, Khasi and Jaintia Hills, in Simla, Malabar, and Cochin, and possibly some recent extensions on the Annamalai Hills in Madras Presidency, which, though apparently excluded from the above table, the 478,888 acres may be taken as ample to cover all From the latest Colonial reports the areas in Fiji and Straits Settlements have been diminishing annually. Tea has been experimented with in Borneo, St. Helena, and other colonies, but the areas are too inconsiderable to be noticed. Neither is the cultivation of much account in any foreign country except China, Japan, and, perhaps, Java. The crops, but not the area, from Nepaul is included with India. In Brazil, Caucasus, Azores, and even in the United States and Italy tea has been grown experimentally, and it is more than probable that in these and other countries it will not get beyond the experimental stage.

From the "Trade and Navigation" Returns issued within the last few days it is encouraging to learn that the consumption of British-grown tea continues to increase, and that the displacement of China and other foreign produce also goes on, and, in fact, is now all but complete. The following table shows this:—

Year.	China, &c.	Per Cent.	Indian.	Per Cent.	Ceylon.	Per Cent.	Total.	Per Head of Population in lb.
	lb.		lb.		lb.		lb.	lb.
1800	20,358,187	100	—		—	—	20,358,827	1·25
1850	51,000,000	—	—	—	—	—	51,000,000	1·75
1866	97,681,000	96	4,584,000	4	—	—	102,265,000	3·42
1879	126,340,000	78	34,092,000	22		—	160,432,000	4·68
1887	90,508,000	49	83,112,000	45	9,941,000	6	183,561,000	5·02
1897	21,272,030	9	124,534,191	54	85,493,554	37	231,397,778	5·86
1898	19,512,009	8	133,430,361	57	82,471,745	35	235,414,105	5·95

As far as can be gathered from the Customs' returns and other sources, the conquest of colonial and foreign markets seems to go on apace, 61¾ millions of lbs. having been taken by markets outside the United Kingdom last year, as compared with say 51½ millions in 1897, 28¾ millions in 1894, and 14½ millions in 1891. We understand that the efforts of our Ceylon friends—to whom we owe so much in the exploiting of new markets—have made satisfactory progress in Russia last year, with every promise of doing five times as much in 1899. In this respect all honour to Ceylon, and may she go on prospering.—*H. & C. Mail.*

THE INDIAN TEA OUTLOOK.

The following is from the *Scotsman* of January 2, 1899:—

"There are not wanting signs that the Indian tea trade is gradually emerging from the depression which overtook it in 1897. This is the more satisfactory because until quite recently it had become the fashion to speak of the future in terms almost of despair. In 1897 there was a general reduction of net profits and of dividend. In order to make modest distributions among their proprietaries numerous companies had to supplement the year's net earnings by drawing on reserve funds, and others, which in 1896 paid substantial dividends, and carried forward good balances, had to report actual losses on the twelve months' operations. It was, therefore, hardly to be wondered at that the reports issued by many of the companies should have had nothing of a favourable character in them, and that chairmen at the several meetings should in numerous instances have painted the picture in gloomy colours. Yet it was recognised by experts that the case was really not so bad as was made out. In the first place, the business had been run at too hard a pace. Then there came a famine in India, which raised the cost of living and the cost of production, and furthermore a considerable rise in the rupee, and a fall in the price of tea. Such a combination of adverse conditions was bound to cause distress to the whole industry and stimulate people of a pessimistic turn of mind to predict general disaster, as if there was no sort of probability that affairs would mend, but on the contrary, everything to warrant a conviction that they must go from bad to worse. This would seem to have been the attitude of the Darjeeling Tea Planters' Association when, about two months ago, it enlarged on the 'critical position' of the Indian and Ceylon tea industry, which it viewed with 'great alarm,' tracing the trouble almost entirely to the high rate of exchange. The remedy for this state of affairs was, in the opinion of the Association, to be found in the imposition of a duty on foreign-grown teas in proportion to the difference in exchange, or the removal of the duty on British grown teas, in order to counterbalance the bounty which, it was alleged, was practically being offered to foreign teas by the existence of the rupee at 1s 4d. There can, of course, be no question that the high rate of exchange proved a great drawback to the British industry, the appreciation of the rupee having been in 1897 equivalent to an addition of about 30 per cent. to the cost of production. But, as

already hinted, that was not by any means the whole cause of the trouble, and its removal would probably only prove temporarily beneficial.

"The growth of the Indian tea industry in the past ten years has been of quite phenomenal dimensions. Thus in 1887 there were 312,803 acres under cultivation, while last year the total was 493,710 acres, being an increase of, roughly, 57 per cent., while in the same interval the production increased from 92,252,082 lbs. to 163,782,208 lbs., being an expansion of about 67 per cent. Concurrently with this movement there has been a steady shrinkage in the price, from an average of 11½d per lb in the earlier year to 8¼d in 1897. While production was large, and the crops brought remunerative prices, it was natural that the industry should undergo a steady and rapid extension. That is the usual experience in the case of every calling prosperity stimulating competition, and bringing about a lowering of profits. The consequence was that a 'boom' set in, and there took place a great rush of new companies, many of which were notoriously over capitalised. This last fact is in no small degree responsible for the troubles of large numbers of British investors, who now find that that they paid too dearly for the enterprises placed before them two or three years ago. It also afforded another instance of overdoing a good thing. There can be no doubt that had it not been for the adverse events which beset the industry in 1897 the same process would have made headway, and that if even all other conditions had remained favourable, excessive competition and over-production, glutted markets, and reduced prices would by themselves in time have brought about a sharp reverse without the aid of any other causes. For this reason the evils complained of were not of an altogether unmixed character. A lesson was taught which it is to be hoped will not soon be forgotten. Indeed, if the recommendation of the Darjeeling Tea Planters' Association was to meet with a favourable response from the Government, which is a by no means likely contingency, it is highly probable that the advantage which would be conferred on the trade at the outset would quickly apply a fresh stimulus to competition, and bring about a repetition of the old trouble of low prices, thereby sweeping away any benefits that might flow in the first instance from a removal of the tax on British-grown tea or placing of a higher impost on foreign teas. Fortunately the growers are not waiting for help of the kind. They have wisely taken matters into their own hands. They have, in brief, ceased to extend the area under cultivation, and are labouring strenuously to keep down expenses. The flow of capital into the business has been checked, and in the meantime new markets are expanding.

"That there will soon be a repetition of the unfortunate experience of 1897 is, it need hardly be said, improbable in the extreme. The famine and the high price of rice proved a terrible incubus on the industry, and incidents of the kind are of such rare occurrence that they may safely be eliminated from calculations as to what may happen in the next few years. As to the question of the exchange, it is possible to exaggerate the effect of the late rise. It is perfectly true that, as already mentioned, it has been a serious burden, but not of so grave a nature that it will not be susceptible of remedy by a slackening of competition, greater care and economy in working, and an improvement in price. That this is a fair view to take of the situation is, we think, pretty easy of demonstration. As already stated, the planters complain that the artificial rise in the exchange was equivalent to an addition of 30 per cent. to the cost of production. But to this disadvantage there were added others previously referred to, among them being the increased cost of rice, which the planters have to supply to their people at a fixed price of three rupees per maund (80 lb). Now rice during the famine rose to about double that figure, so that here we had a further leakage of profits. Yet on looking into the accounts of twenty-four representative companies, whose experience may be said to sum up that of the whole industry, we find that whereas the net profits amounted in 1896 to, in round figures, £376,000, in 1897 they had diminished to £253,000, being a falling off of about 33 per cent. The rise in the rupee was, therefore, only one of the adverse influences which brought about this state of affairs, and the natural assumption is that with an amelioration in other directions there should take place a gradual improvement, notwithstanding that the rupee be maintained at its much execrated rate of 1s 4d. In the old days the companies divided their net earnings pretty well up to the hilt, thus making too small a provision for the contingency, to which they are so much exposed, of a rainy day. In more recent periods they have improved on this. In 1896 the twenty-four companies referred to added to their reserves or carried forward £77,000; but in 1897 they paid away the whole of their profits and drew upon their reserves in order to distribute dividends which fell lamentably short of those declared in 1896. Inconvenient as a high exchange may be, it is not a matter that threatens the Indian tea trade either with extinction or with really serious embarrassment. The trouble has been very much a matter of prices. When the exchange stood at 1s 4⅛d in 1887, and tea commanded 11½d per lb in the London market, the trade did well, and it flourished in 1890, when, as a result of the passing of the Sherman Act, the exchange rose to 1s 6⅜d, notwithstanding that the price had come down to 10½d per lb. The Indian industry pushed ahead as well under a high as under a moderately low rate of exchange, and it was not until it came to be forced with an undue rapidity that it began to feel the effect of the alteration in the exchange. We are fully aware that underlying the fears expressed as to the ruinous effect of a highly valued rupee is a dread that the China industry may become suddenly stimulated because of the advantage enjoyed by the Celestials in respect of their cheap silver, and doubtless if the industry could be conducted in the latter country under as favourable conditions as those existing in our great Eastern Dependency there would be good ground for apprehension. But the conditions are not yet so favourable, and only very distant signs have so far been forthcoming that China will for some time to come figure as a really formidable rival. On the whole, we strongly incline to believe that the Indian tea industry has got through its troubles, and that with care it will be again placed in a prosperous condition."

DISTRICT ASSOCIATIONS.

CENTRAL TRAVANCORE.

The Annual General Meeting of this Association was held at Penshurst Bungalow, on Saturday, 21st January, at 10 a.m., when there were present. Messrs. F. M. Parker (*Chairman*), F. Bissett, H. J. Blandford H. D. Deane. R. H. Goldie, R. S. Imray, B. Laurie, H. S. Holder. W. H. J Leahy, J. E. Pigott, D. MacArthur, the Hon. V. B. Wilbraham, A. E. Veale. and as visitors Messrs. E. Lalter. W. MacGrath, N. MacGowan and E. Williams.

The Chairman, Mr. F. M. Parker, in opening the Meeting, read a letter from Mr. H. W. Baker, the Honorary Secretary, expressing his great regret at being unable to attend the Meeting owing to illness and on account of which he had been unable to prepare the usual Annual Report.

The Minutes of the last Meeting having been taken as read, the agenda paper was proceeded with.

Accounts for 1898.—The accounts for the past year were passed subject to revision by Mr. A. E. Veale.

Election of Officers.—The ballot resulted as under :—

Chairman	...	Mr. R. H. Goldie.
Honorary Secretary	...	„ A. E. Veale.
Committee	...	Messrs. B. Laurie.
		„ F. M. Parker.
		„ R. S. Imray.

Votes of thanks.—Cordial and hearty votes of thanks were proposed and carried unanimously to Mr. F. M. Parker for his valuable services to the Association as Chairman during the past two years; and to Mr. H. W. Baker, the late Honorary Secretary for the able way in which he had conducted the arduous duties of his office.

Mr. F. M. Parker briefly replied.

Subscriptions.—Proposed by Mr. Laurie and seconded by Mr. H. D Deane that the subscription for the current year be fixed at the rate of annas five per cultivated acre *Carried.*

Read and Recorded Mr G. L. Acworth's reply to vote of thanks.

Shipping facilities at Cottayam.—Mr. H D. Deane in proposing "that H. H Government be asked to erect a covered landing stage with a boarded floor at Cottayam," said, that he had frequently seen tea and rice turned out of carts and wollams into the mud and exposed to the rain and which in consequence suffered much damage, so much so that he had received complaints from his Cochin agents of the dirty condition in which his tea invariably arrived at that port. He also pointed out that planters would by no means be the sole gainers by the erection of the proposed landing stage, all merchants and others importing or exporting goods by backwater from

Cottayam would derive equal benefit therefrom. Several other members having spoken to the same effect, the proposition was seconded by Mr. Imray and carried *nem con.*

District Roads.—Proposed by Mr. Imray and seconded by Mr. Parker, "that the attention of H. H. Government be drawn to the delay in granting outlet roads to land bought as far back as 1895; the delay seriously interfering with the development of the land and retarding progress in the district; which the tea industry can ill-afford in the present crisis.

"The following roads being particularly mentioned to the Dewan:

"1. Bridle path from Arlady through Kolikarnum to meet cart road at Maimalai gap.

"2. Cart road from Kolikarnum through Fairfield to Cardamom Hill road.

"3. Cart road from Granly Estate through Mount to Periyar River." Carried *nem. con.*

Bridges.—Proposed by Mr. Laurie and seconded by Mr. Holder, that the Chief Engineer's attention be drawn to the extremely dangerous condition of all the bridges in the district, and that he be requested to issue orders to have them promptly put in a safe condition." Carried *nem. con.*

With a vote of thanks to the Chairman the Meeting terminated.

"The following papers were laid on the table:—

Proceedings of Coorg Planters' Association.
Do. Wynaad do. (2)
Do. Shevaroy do.

(Signed) A. E. VEALE,
Honorary Secretary, C. T. P. A.

NILGIRI.

Proceedings of a General Meeting held at the Masonic Hall, Ootacamund, January 27th, 1899. PRESENT:—Messrs S. Bayly, A. H. Gerrard, L. W. Grey, J. Harding Pascoe, H. D. Wilbraham, J. W. Minchin, W. L. Edmiston, and E. G. Windle (*Honorary Secretary*). Mr. Edmiston was asked to take the chair.

I. Proceedings of last Meeting were taken as read and confirmed.

II. The Honorary Secretary reported progress on the different matters which had come up before the U. P. A. S. I.

III. **Planting Opinion.**—*Read* circular dated October 3rd, 1898, from the Proprietor, announcing that *Planting Opinion* was now conducted by him, and asking for support.

IV. **London weighing of Tea.**—*Read* circular dated June 1898, re correct and incorrect methods of packing, etc.

V. **Producers' Co-operative Co.**—Shevaroy proposal was read and recorded.

VI. **United Coffee Producers Co.**—(for selling coffee direct to consumers).—The Honorary Secretary put the scheme of the proposed Company before the Meeting; the prospectus had been drawn up the previous day and would be issued very shortly to planters and others interested; considerable support had already been promised.

VII. **Adulteration of Coffee.**—Mr. Windle moved "that this Association request the U. P. A. S. I. to petition the Home Government for more stringent legislation against adulteration of coffee and to endeavour to unite the coffee-producing countries of the world in support of the movement, and in pressing it upon their respective Governments." Seconded by Mr. L. W. Grey and *carried unanimously.*

VIII. **Place for N. P. A. Meetings.**—The Meeting, with one exception, was in favour of retaining Ootacamund as the place for holding Association Meetings, it being the centre of the district and head-quarters of the official Honorary Members: the District Board and Game Association Meetings also being held there to furnish additional inducement for attendance

IX. **Deterioration in the quality of E. I. Coffee.** The Honorary Secretary brought up this, giving it as his opinion that the recent irregular seasons and probably the increasing custom of judging coffee by liquor instead of appearance were the main factors in the poor prices recently obtained. The Honorable Mr. H. Percival Hodgson, in a letter which he sent on the subject, held that better and more scientific curing was required to enable E. I. coffee to hold its own against the large South American crops, whilst Mr. L. W. Grey considered that his experience pointed to shade as being the best method of improving quality.

X. **Plague Precautions.**—*Read* Collector's letter dated December 1898, giving particulars of precautions against plague in the Nilgiri District. The Acting Collector stated that the mention of inoculation have caused great alarm amongst the natives in Wynaad and elsewhere, Ootacamund and Coonor would be the only centres for inoculation. All Superintendents of Estates are requested to inspect labour coming from infected districts. Further measures were also discussed, Mr. L. W. Grey advocating a plague camp for the Buckapuram Ghât as soon as the Kakenhulla had to be closed owing to malaria.

A vote of thanks to the chair closed the proceedings.

(Signed) W. L. EDMISTON,
Chairman.
(Signed) E. G. WINDLE,
Hon. Secretary.

N.B.—All Managers of Estates are now to be regarded as the "local authority" for inspection of coolies from plague-infected districts. Copies of the Collector's notice to this effect and rules for inspection can be had on application to the Hon. Secretary, N. P. A., by those who may not have received them direct.

MARKET REPORT.

[*Advices by the Mail of 20th January*, 1899.]

COFFEE.

The *Record* says: Only moderate supplies have been brought to auction during the past week, including the first arrivals of new crop Coorg and Wynaad, and these, like the Neilgherry, are deficient in quality; Coorg chiefly sold, but competition was slow, and Wynaad was nearly all withdrawn for want of reasonable offers. There has been a fair demand for Central American descriptions, with rather dearer prices for desirable qualities. "Futures" have been dull, and prices for the week are easier, closing as follows:—

London	... Santos	... March delivery	...	31*s.* 0*d.*
New York	... No 7 Rio	... „ „	...	5·55 cents.
Hamburg	... Santos	... „ „	...	31½ pf.
Havre	... Santos	... „ „	...	37¾ francs
Holland	... Good ordinary Java		...	32½ cents.

Imports Deliveries and Stock of COFFEE in London are as follows:—

	STOCK.		IMPORTS.		HOME CONSUMPTION.		EXPORT.	
	1899.	1898.	1899.	1898.	1899.	1898	1899	1898.
West India...tons	420	505	53	251	14	13	20	48
Ceylon	69	112	5	6	4	5	—	8

Total tons...13825		10105	702	1702	583	594	705	590

The preceding figures exhibit—

In the Imports a decrease this year of	1000	tons
Home Consumption a decrease of	11	„
Export an increase of.....	115	„
Stock an increase of.....	3725	„

Auctions have passed off as under:—

CEYLON.—*Native.*—63 bags retired unsold.

EAST INDIA.—333 bags partly sold as follows:—*Coorg*, smalls 50*s.*, middling 69*s.* 6*d.*, bold 91*s*, peaberry 106*s.* to 104*s.*; *Wynaad*, triage 36*s.*, smalls 46*s.*

LAHAT.—90 bags bought in.

WYNAAD.—*Liberian.*—11 bags sold—bold 30*s.*

JAVA.—*Liberian.*—106 bags sold at 42*s.* 6*d.*

SOUTH SEA.—18 bags withdrawn.

MOCHA.—44 half-frazils bought in.

JAMAICA.—86 barrels 13 bags partly sold—ordinary mixed 32*s.*, good ordinary 34*s.*

COSTA RICA.—769 bags partly sold—new crop, smalls 31*s.* 6*d.* to 38*s.* 6*d*, low middling 52*s.*, middling to good middling 65*s.* to 73*s.*, good bold colory greenish 92*s* 6*d.* to 97*s.*, peaberry 70*s.* to 90*s.*; old crop, ordinary 40*s.* to 42*s.*, low middling 51*s.*, faded peaberry 41*s.*

GUATEMALA.—808 bags, barely half sold. common pale 34*s.*, fine fine ordinary 48*s.*, low middling greenish 54*s.* 6*d.*, bold 70*s.*, peaberry 69*s.* 6*d.*

SALVADOR.—183 bags sold. new crop low middling gray 44*s.* 6*d.* to 45*s.*, greenish 49*s.* 6*d.* to 50*s.*, peaberry 60*s.*, old crop 46*s.*

NICARAGUA.—119 bags sold, foxy 37*s.*, fine ordinary dull greenish 44*s.* to 44*s.* 6*d.*

MEXICAN.—251 bags sold, greenish 48*s.* 6*d.* to 52*s.*, peaberry 62*s.*

VERA PAZ - 994 bags s ld, ordinary dull brownish 37*s.* to 39*s.*, fine fine ordinary to low middling 47*s.* 6*d.* to 54*s.*, middling to good middling 60*s.* to 67*s.*

COLOMBIAN —1,010 bags mostly sold, smalls 29*s.* to 42*s.* 6*d.*, dull soft mixed 42*s.* to 44*s.* 6*d*, low middling soft 45*s.* 6*d.* to 57*s*,. middling to good middling 61*s.* to 75*s.* 6*d.*, good bold colory to fine blue 79*s.* 6*d.* to 86*s.*, peaberry 61*s.*

PERUVIAN. - 26 bags ordinary pale greenish sold at 31*s.*

BRAZIL.—250 bags Rio bought in.

Receipts in Rio and Santos.

To day's auctions offered 273 bags East India, 57 barrels 25 bags Jamaica, 37 hf-frazfls Abyssinian, 87 bags Peruvian, 430 bags Colombian, 175 bags New Granada, 1 164 bags Vera Paz, 163 bags Coban, 296 bags Costa Rica, 242 bags Guatemala, 62 bags Venezuela. 220 bags Salvador, and 14 bags Guayaquil Colory Costa Rica sold under yesterday's prices, but nearly all offered in sale were placed. Tone of the market dull

TEA.

INDIAN.—An increased quantity was brought forward, aggregating 55,500 packages contrasted with 44,900 packages in the previous week and 62,300 packages at this time in 1898.

Common to fair Pekoe Souchongs and Pekoes with useful cup often advanced ¼*d.* per lb., while the better lines of these were occasionally quite ½*d.* per lb. dearer. Medium Broken Pekoes, unless with special point, did not mark much change, but quotations for fine and finest "tippy" lots were higher, among the best Broken Orange Pekoes being:—Hapjan Estate, AF TCo., 2*s.* 10½*d.*; Subansiri Estate, J (A)TCo., 2*s.* 4*d*; Beesakopi Estate, DD TCo., 2*s.* 3½*d* ; Samdang Estate, DDTCo., 2*s* 2½*d* ; Mazengah Estate, Am. Co., 2*s.* 1½.; Borbarrie Estate, Raj. TCo, 2*s.* 0¼*d.* per lb South India was represented by 1,500 packages, chiefly from Travancore, quality on the whole being of a saleable style, though not calling for special notice.

Although supplies since the commencement of the year have appeared somewhat large, viz , 131,000 packages, this is considerably under those in the corresponding period of the preceding January when 161,000 packages were offered, and has apparently not been too much for buyers, as demand was good throughout, and prices in most cases bave tended upwards. It is to be hoped that this improved condition of things will not induce importers to unduly force the market, as the statistical position is unusually strong, and it seems that the 1898 crop should (if deliveries continue as of late) be easily absorbed.

For 42,400 packages on estate account, 9¼*d* per lb. was realised *versus* 8½*d.* per lb. for 49,500 packages, and 9½*d.* per lb. for 42,600 packages in the two former seasons.

Entries for export to Great Britain since 1st April, 1898. to 15th inst. were 126,867,000 lbs., against 125,320,000 lbs. to the same date in 1898

CEYLON.—Public auctions were smaller, totalling 16,200 packages, whereas on the 10th inst. 27,400 packages passed the hammer and 21,100 packages on the 18th January, 1898.

Notwithstanding the reduced amount catalogued, there was some irregularity in the biddings. parcels with desirable flavor generally bringing more money, while the less attractive ruled against sellers. Continental orders were scarce, partly owing to the Russian new year holidays; but in spite of this, leafy sorts below 6½d per lb. hardened slightly in value. Medium grades were not so much sought after, but the few finest commanded full figures

The average is the same as on the 12th inst., when it stood at 8½d per lb. A year ago it was 8½d per lb

JAVA.—In the absence of business there is nothing to report, except that about 1,300 packages are advertised for the 26th inst.

PEPPER.

Black.—An active demand was experienced at the commencement of the week and higher prices were paid, but demand has latterly fallen off and market is now quiet. About 450 to 500 tons have changed hands, including Singapore on the spot at 5 3/32d to 5⅛d, Jan.-March shipment at 5 7/16d, Feb.-April at 5⅛d, and March-May at 5¼d—the later month closing at 5 5/32d sellers. Tellicherry on the spot has been sold at 5⅛d, February-April shipment has been sold at 5¼d landed terms, also some business in February-April at 5¼d c.i.f. New York.

At auction on the 18th inst., of 343 bags Singapore 20 bags sold at 4¼d for greyish. 70 bags Penang about half sold at 4¼d for 3 lbs. 13 ozs. per gallon, dust 4 %. 80 bags dusty small Java bought in at 4½d per lb.

On 20th inst. prices were lower. 20 tons Singapore Black March-May shipment sold at 5 3/32d—a drop of 1/16d, also some business on the spot at 5¼d.

The shipments of Black Pepper for the first half of January compare as follows:—

	1899.		1898.	
U.K.—Singapore ...	*nil*	70	120	130
,, Penang ...	70		10	
Continent ...		50		200
U.S.		100		60
Total tons...		220		390

In *White* a considerable business has been done—in all 400 tons, viz., Singapore on the spot at 8⅜d to 9d for fair to good Jan.-March shipment at 8⅞d, and Feb.-April and March-May at 8½d; Penang on the spot at 7½d for fair, Jan.-March at 8d, and Feb.-April at 8 1/16d per lb.

At public sale on Wednesday, of 20 cases 717 bags Singapore brought forward, 180 bags sold—fine bold at 9⅜d, good bold but rather dullish 9d, fair 8½d per lb.

The shipments of White Pepper for the first half of January compare as follows:—

	1899		1898.	
U.K.—Singapore ...	60	200	*nil*	20
,, Penang ...	140		20	
Continent		*nil*		60
Total tons...		200		80

COCOA.

Moderate supplies, amounting to 4,296 bags, were offered at public sale on Tuesday, of which 2,500 bags pound buyers at slightly under valuations 660 bags Trinidad one-third part sold at 74*s.* to 75*s* for fine red and 72*s* to 73*s.* for middling to good, being about last auction's rates. 160 bags Grenada met a quiet demand, 100 bags selling at 67*s.* to 70*s.* for fair to fine red and 64*s.* for common, or about 6*d.* cheaper. Of 452 bags Guayaquil 150 bags were placed at late rates—70*s.* for Caraquez 46 bags Surinam and 97 bags Columbian retired unsold, also 226 bags Samana. Of 378 bags Bahia 78 bags good fermented realised 67*s.* to 68*s.* which was below valuation. 282 bags Jeremie half sold at 62*s.* for ordinary gray 720 bags African about one third sold at a slight decline—good fermented 67*s.* 432 bags Ceylon were all placed at 70*s* to 72*s.* for dull to good red bold and medium, and 56*s.* to 61*s.* for black and pickings. Private transaction include 200 bags Dominica at 65*s.*, 1,000 bags African at 65*s.* to 68*s*, and 2,000 bags Guayaquil, Summer Arriba at 76*s.* to 80*s.* 6*d.*, Winter Arriba and Caraquez 69*s.* to 74*s.* per cwt.

GINGER.

Cochin is a very slow market. and the small offerings 47 cases 35 bags—retired with hardly a bid being made—bold A cut at 86*s*, washed rough at 25*s.* per cwt.

As high as 27*s.* c i.f. has been paid for assortment March-May shipment, but owing to the dapession for spot prrcels the c i f. quotation has since receded to 26*s.* c.i.f., with resellers under this price—as low as 25*s.* c.i.f. so it is said.

Japan.—320 bags plump limed were bought in at 22*s.* per cwt.

THE UNITED STATES AS A MARKET FOR TEA.

IN a recent report, MR. BLECHYNDEN expressed the opinion that the prospects for Indian tea in the United States were hopeful, as during a short tour he had made he had found Ceylon and Indian teas displayed under their own names in quite small places. He also referred to certain criticisms, of which details were lately given in our columns, and remarked that it was gratifying to find that, unsolicited by him, several independent representatives of importers had replied to those who had objected that China teas were purer than Ceylon and Indian. No doubt our readers will remember that one ground of argument was that manuring was resorted to in India and Ceylon, but not in China. MR. BLECHYNDEN retorted very effectually that in China night-soil was employed as a fertilizer for tea; but it can scarcely be said that he was equally happy in his reply about India and Ceylon. Doubtless the critic who made the comparison honestly thought he was right; and he had at least this authority to fall back upon, that in 1894 the United States Consul in Colombo, reporting on "Ceylon Tea for the United States" remarked:—"To

keep up the quality manuring is necessary, but the price of tea in Europe (18 cents per pound) does not pay for fertilizing; neither will manuring pay in the higher altitudes, though the price of high grown tea is about 25 per cent. more than of that which is grown in the low country nearer the sea." Without indorsing these opinions, we may at least refer to them as giving some support to the critic who said that Ceylon tea-plantations were manured. While on this point, too, we may refer to one or two further statements in the same report, that remind us of the difficulties that Indian and Ceylon tea producers had, and in a measure have still, to overcome before the Amercian market can be regarded as conquered. The American Consul held that as "most low grown teas are too poor in quality for anything but blending purposes, some not being even fit for that, it follows that, as a rule, only high grown Ceylon tea is suitable for the American market." The problem was to supply a better article than the Chinese and Japanese leaf, at as low a price, or even a lower. To do this, he conceived that nothing cheaper than 20—25 cents. per pound could be successfully used, and he observed that very little tea of this class was sold in the local market. Supplies being generally sent to London, tea suitable for the United States would have to be bought there, after its cost had been greatly enhanced by many intermediate expenses and charges. Hence, he judged that it was by no means certain that China and Japan teas would be easily or largely displaced in a country where they were already used to the extent of 85,000,000 lbs. per annum.

One factor to be considered was that there was no element of reciprocity of trade between the United States and Ceylon; but although the progress that has been made since 1894 is not very startling it at least shows that a considerable amount of success has been achieved in the face of adverse circumstances. Tactics have been modified. Advertising and pushing of trade with retailers has been followed by an appeal to wholesale dealers. Naturally, these gentlemen do not care to buy until they have a reasonable prospect of selling; but they have already realised that for blending purposes, at least, Indian and Ceylon teas are very useful. We take it that the use of blends of this kind will in time help to "educate the palate" of American consumers to an appreciation of pure Ceylon and Indian teas. We have mentioned instances of late that have shown that there is no mere prejudice against these: in some cases there is a sort of natural aversion to them. This may be overcome by a process of "acclimatisation," so to speak, conducted by means of blends of China and Indian teas. If the strength and quality of Indian teas are maintained and prices kept down, the natural tendency of dealers will probably be to go on increasing the proportion of Indian leaf in their blends, and thus the taste of buyers may be "converted" by slow and imperceptible degrees. This is a process that should be warmly encouraged by the Indian Tea Commissioner and his coadjutors, though there is no reason why they should relax their efforts to push *pure* Indian teas among consumers. Advertising must be continued, of course; personal canvassing is essential; lecturing appears to be useful in the United States; and "demonstrations" should be freely resorted to. Some of the large stores are now making such demonstrations on their own account. Sample cups of Indian or Ceylon tea are to be had for the asking, and doubtless efforts of this kind will, in time, result in an increase of demand. A glance over statistics shows how much scope there is for this, and while planters may sometimes feel that the American campaign has proved very costly, and has yielded no results proportionate to the outlay occurred, there is always a very large teapot indeed casting a shadow over the future and hinting at the prize that may yet be secured by persistence and perseverance.

We do not feel that South Indian tea planters sufficiently recognize the possibilities of the American market, nor do we think that they are making sufficient effort to extend trade in that country. It is not our desire to set South India against North, or either against Ceylon. "Union is strength" in this matter of canvassing new markets, and India and Ceylon do well to stand together. But hitherto South India has given very little support. It has not borne a fair share of the financial burden, it has not done a fair share of the work of canvassing, and proselytizing: it has stood almost inactive. This is not as it should be, and even if tea in the South is a small thing compared with tea in the North; even if the financial capabilities of Ceylon Tea men are beyond comparison with those of South Indian tea planters; still every year promises to bring about an improvement in these respects, and it would be well for a start to be made. By the time the next meeting of the U. P. A. S. I. is held we hope to see some definite plan of action under consideration. Coffee-men want to push coffee; let tea-men push tea simultaneously; and let the Association help both, fairly and impartially. Let South Indian planters take a direct interest in the American campaign and make the merits of Nilgiri and Travancore Teas known to their American cousins. Amalgamation with the Indian Tea Association's plan would, no doubt, be possible; independent action would be equally so, but much more expensive. It is for planters themselves to consider *how* they should act; but there is really no room for doubt as to the expediency, nay, the necessity, of taking action of some kind.

HANDBOOK OF AGRICULTURAL CHEMISTRY FOR INDIAN STUDENTS.

Mr. S. H. Collins, F.I.C., Assistant Agricultural Chemist to the Government of India, has published a very useful little Handbook of Agricultural Chemistry. He has only been employed by the Government of India for 5½ years, but his position has naturally afforded him quite exceptional opportunities for the acquisition of information and experience. He has also made use of Dr. Leather's work, and various gentlemen, on his office staff and elsewhere, have assisted him to compile the analyses, &c., required for his publication. The analyses given are chiefly Indian and based on the average results of the treatment of several samples. The arrangement of the book is good. Starting with the Chemistry of the Plant and its life history, we are carried to the Chemistry of the Animal and then of the Dairy; the Properties of Soils, the Chemistry of Soils and Manures are next considered. Then come chapters on the Supply of Combined Nitrogen and Water; and finally, a copious analytical index. The absence of an index of chapter-subjects is rather noticeable, but is not a very serious defect.

We commend this book to the notice of all our readers. It is no more than it purports to be: a *hand-book;* but there is a great deal of very useful information in it, and the planter unversed in science who dips into this little work will acquire a little general knowledge which will probably make him anxious to "drink deeper" at the spring of scientific

instruction. The price of the book is only 12 annas ; it is published at the office of the Superintendent of Government Printing, India. The printing, by the way, is far from creditable to the Government Press.

NORTH BORNEO AS A RIVAL.

Rhea.—The *British North Borneo Herald* reports that as yet, although Rhea has been largely sown, no sufficient crop for decorticating has been produced. Rains, wild cattle, and want of experience are largely responsible for past disappointment, but a very short period should see the young plants now in place producing a crop of commercial value. A new concession for this product has been taken up on the new railway line.

Pepper.—This is entirely in Chinese hands, and is grown in small plantations. It promises to become an important export as the country is gradually opened up.

Rubber.—The plantation opened by the Mortgage Investment Co. on the Labuk is said to be doing well, but, says the *B. N. B. Herald*, the plants are, of course, as yet too young to produce any gum ; and some years must elapse before the enterprising planters reap their due reward. The variety known as Ceará proves to be indigenous. Guttapercha has not yet been planted.

Tea.—The Government experimental plantation at Sapong is well reported on, and tea may in time become an article of local commercial importance.

Coffee.—The low prices ruling for some time have depressed what looked like an increasing industry in North Borneo. As we close the year, says the above contemporary, prices, which had risen, have again fallen and are quoted at $19 to $20 per picul of fair clean Liberian coffee. Cultivators, however, have not been in the main discouraged, the laws of supply and demand being pretty sure to bring about an improvement in the market. Of the Taritipan Coffee Estate in Marudu Bay we continue to hear good accounts. The latest report is that the older coffee never looked so well, which the Manager attributes to judicious forking and the crop on this estate again shows an increase on the previous year.

COFFEE IN CENTRAL AFRICA.

Favorable reports have been received regarding the coming coffee crop in Mlanje. The following is from the *Central African Times* :—"The late rains have brought out in some cases a third blossom on the coffee, and crop prospects are even better than they were a month ago. Everything points to next year being a record one. Cholo particularly seems to be going to redeem the promise of its earlier years." Again, "next year, it is estimated by some, the coffee export will touch a thousand tons and it will be impossible with our present means for that amount to be transported to the river before the rains come on, unless the crop is abnormally early. This year a good deal of the coffee was not away when the first rains came." To support the above, we have a statement lately made by Colonel Manning, Deputy Commissioner and Commandant of the Forces in British Central Africa, who arrived home last month. Speaking of the general development of the Protectorate and its commercial prospects, Colonel Manning says that there has been steady development during the past year. A very large amount of country has been opened up for coffee plantations, more, possibly, than during any former year. The coffee crop during the past twelve months, owing to the drought, which has been almost unprecedented, fell somewhat below what it should have been, but, owing to excellent rains since the last crop, the prospects for coffee this year are the very brightest. Such a blossom as has been on the trees this year has never been seen before in the Protectorate. The crop is estimated at 1,000 tons, and should not fall much below this figure if the present conditions continue. A very gratifying feature is the belief of the planting community in the possibilities of the country, and the plucky way in which they have worked under somewhat adverse conditions. The price of Nyassa coffee last year on the London market reached 114s. per cwt. being the highest price that any coffee has fetched anywhere. No doubt the experience gained by the planters during the past few years will enable them still further to improve the quality of the coffee, and a further increase in price may be looked for. In a few years time, says Colonel Manning, "the Protectorate will be one of the great coffee centres of the Empire, with a class of coffee better in quality than any yet placed on the market."

TEA FOR GOLD.

An anonymous correspondent of the *Pioneer* has sent an interesting letter upon Indian Trade with Yarkand and Thibet, and has told how "There is gold enough on the roofs of the Lamaseries in Lhassa and Potala to pay off the whole gold debt of India." It does not propose to *loot* this, but suggests "peaceful trade" as a means of getting it—perhaps with some idea that the mercantile missionary might be once more useful, with Bible under one arm and Cash-book under the other. The *Times of India* seems to think the "peaceful" process might lead to war, and observes that it is unfortunate that really useful schemes for the development of Indian trade with Thibet should have been so frequently associated of late with proposals involving conquest and spoliation. But the Indian Tea Association has suggested a peaceful way that it no doubt thinks would be just the thing. According to its plan, we should barter bricks of tea for roofs of gold, and thus arrive at an exchange very favorable to India! Here again, however, there is a cold water thrower at hand. *Capital* wonders if it is known how much tea is consumed in Thibet and of what character, and says :—"The amount used is an unknown quantity, and we do not for a moment believe that so much as 500 lbs. of Indian tea finds its way into that heathen country. From all that one can learn, the only kind of tea drunk in Thibet is brick tea, a vile decoction of old tea leaves, rotted and fermented in rice water, until it becomes sufficiently consistent to make into bricks ; a piece of this, after it is dried, put into hot water, and worked up with a swizzle, is the favorite beverage of the Thibetan, and we must give him credit for a high taste to say the least of it."

When writing this, however, our Calcutta contemporary had probably no visions of "roofs of gold" before it. None of its representatives had had the pleasure of standing afar off, and scanning the yellow glow of sunset as reflected from the golden roofs of Lhassa. Hence, *Capital* is sternly practical. Now, it asks, what is the use of the Tea Association wasting its energies on such a paltry question as that of Indian tea being put on the Thibet market when so many other opportunities offer to push new markets? "Why do they not go upon something substantial, such as the removal of the duty that is levied on the tea exported to

Afghanistan? Some years ago the whole of the produce of the plantations in the north-western corner of our frontier went across the border, and at very remunerative rates, whereas the quantity thus dealt with now is infinitesimally small. Does not this point to some grave mismanagement, or, to put it more mildly, want of forethought on the part of some one, when treaty obligations have been discussed with our neighbour, and supposed ally, the Ameer of Afghanistan?" Still, our contemporary advocates new markets. It merely suggests that there are markets of far greater moment than that of Thibet. Perhaps it is right, so our efforts to get gold in exchange for tea should take some other direction.

SOUTH INDIAN PRODUCE IN LONDON.

Reports from London concerning *Pepper* continue to reflect a strong demand, with large orders for America for all sorts, including Tellicherry and Aleppy descriptions. The American cupboard appears to be nearly bare, in fact, and replenishments are likely to lead to a steady demand in London. Reports from India have not tended to lower the value of the spice. They have told of unseasonable cold, and heavy rain, which is supposed to have damaged crops. Then even the Plague has served a certain useful purpose, for we find a Home paper remarking:—"How the Pepper, or for the matter of that, all produce, is to be brought down from the interior to the export-ports is a riddle which European shippers are sorely puzzled to solve. A squeeze for Pepper, Coffee, Ginger, &c., may thus occur at any moment. This would amount to a calamity, particularly to the planters of East India Coffees, who have had a specially unfavourable season, and who entirely depend upon the coolies for the conveyance of their yield to the coast." On the contrary, however, fears (in London) of a squeeze of this kind may help the planter a little, and many of our friends will not be sorry to learn that London importers are a little doubtful as to the amount of supplies that will be forthcoming. As regards Coffee, it is reported that the arrival business in fine colory sorts, such as Coorg, Wynaad, Mysores, Neilgherries, &c., has been an exceptionally poor one; probably not more than 500 tons of Estate Coffee have been disposed of on arrival terms. A London paper states that the high prices which the first offers commanded gave rise to an utterly false notion of the strength of our market in the mind of Planters. "They held out for impossible prices, with the result that European buyers withdrew. Australia, which for some little time paid values much above London parity has completed her requirements, and there is nothing left for the Planter but to ship his Coffee on consignment to London, where, we fear, it will not receive a warm welcome, particularly if the quality should show no improvement on that of the first arrivals. East Indian Coffees so far have with few exceptions, been very poor in size and colour, and intending purchasers now congratulate themselves on having resisted the temptations of a speculative purchase of East India Estates. Low Coffees having lost in value to a very great extent, we fear that Indian descriptions will meet with a poor demand here unless their quality be such as to suit the taste of our trade." These last remarks we fully indorse. If once the great superiority of Indian Coffee is lost, prices will be influenced more and more by those of Brazilian descriptions, fluctuations will be more frequent and more violent, and the level of values will be lowered—probably, not in strict proportion to the deterioration in quality but according to a scale of geometrical progression that will mean disaster to the Indian coffee-planter. Should he at any time sacrifice quality to quantity, he would simply leave the higher level of values to African and some Central and South American descriptions, and enter the lower lists in competition with Rio and Santos sorts. This could not last very long.

NOTES.

Good news from Brazil. "The low price of coffee has led Coffee planters to think of growing other products."

Tea in Ceylon. It is asserted that Mr. Kelway-Bamber is confident of being able to do much for the improvement of Ceylon tea on many plantations, if not over many districts.

The British Import Duties. During 1898 the British Exchequer realised from the import duties on tea £3,923,566; on Coffee, £175,565; on Cocoa, £191,073, and on Chicory £53,157.

Extensions. At a recent meeting of the Duars Planters' Association, reference was made to the fact that since 1894 tea gardens in a particular locality had expanded from 2,700 acres to 8,900 acres.

Soil Analysis. The Director and Chief Chemist of the Experiment Station in Hawaii states "that he has established a new method of 'Soil Analysis,' which aims" at knowing the actual amounts of the essential elements in the soil that are available for the immediate future crop.

The Progress of Tea Consumption. The *Grocer* observes, that progress in the consumption of tea is essentially of a steady-going nature, moving regularly onwards without fits or starts, and illustrating in a substantial and practical form the industrial and domestic habits of the British population as a whole.

Opening up. There is an enterprising gentleman in Cholo, B.C.A., who "begs to intimate that he is prepared to take Contracts to open up in coffee for one or two years, or to bring into bearing, any extent from 100 to 500 acres. Large experience in opening up." This is *one* way of solving the Labour problem, as far as the estate proprietor is concerned.

The Nuwara Eliya District P. A.

The annual official estimate of the crop for 1899 from returns from Nuwara Eliya, Ramboda, New Galway and Kandapola shows 26 estates with an average of 6,482 of which 5,519 are in bearing and a probable crop of 2,637,650 lbs. or about 478 lbs. per acre as against 429 lbs. estimated in 1898.

The "Pepper Tree."

The exact meaning of the following extract from an African paper is not quite clear :—"Planting is being rapidly pushed forward at Bulawayo, there being about 40,000 trees already planted out, and another 10,000 ready in the park for this purpose, the trees being of swamp mahogany, pepper, and blackwood varieties." If the pepper vine is receiving attention in Africa, the eventual result can hardly be conducive to firmness of price.

Cinchona Bark.

Major D. Prain, Indian Medical Service, successor to Sir George King, M.D., as Superintendent of the Calcutta Botanic Gardens and Supervisor of the Government Cinchona Gardens, has been enquiring if bark could be purchased from the planters. Apparently he has not yet been informed of the action taken by the Madras Government in respect to this matter. Planters having pressed Government to try their cinchona, inquiries such as Major Prain has been making are surely superfluous.

The Tea Association of New York.

The Tea Association of New York has filed with the Secretary of State a certificate of incorporation. The association is formed to foster trade and commerce, and to look after the interests of its members who are engaged in the importation of teas. The Directors are Thomas N. Phelan, Frank S. Thomas, Thomas M. McCarthy, Joseph H. Lester and James W. McBride, of New York City ; George C. Cholwell, of Norwalk, Conn.; Russell Bleecker and George L. Montgomery, of New-Brighton, and William J. Buttfield, of Plainfield, N.J.

The Fate of Coffee: Falling back on Cocoanuts.

The *Malay Mail* thinks that coffee planters are indeed to be pitied. The market price of coffee has fallen to such a price that it is impossible to grow it at a profit, while hosts of caterpillars are now playing fearful havoc on some estates, whole trees being stripped absolutely bare of all leaves. The planters will have to make up their minds as to the utility or otherwise of going on. It seems to our contemporary that the only hope of financial salvation lies in cocoanuts, and from an economical point of view taking up land along the sea shore would be to their advantage, a small gang of men only being retained to keep down the lalang on their coffee estates.

The London Tea Market.

In their telegram of 9th instant to Colombo, Messrs. Gow, Wilson and Stanton reported that the market generally was unchanged, while that for teas with quality also showed no change, and the market for poor liquoring teas showed a tendency to advance. The price of fair liquoring Ceylon Pekoe Souchong was 6½*d* and the average 8*d*.—Reuter reported :—Tone of Ceylon Tea—Teas for price realized full rates. Fair Pekoe Souchong 6*d* and the average 8⅛*d* (both the same as the previous week). 24,000 packages of tea were offered for sale, of which 23,000 sold. Of Indian Teas 39,000 packages were sold out of 42,000 offered, and the average, 9½*d*., showed a decline of ½*d*.

Ipecacuanha.

We made reference to this product some time ago. Latest advices from London state that there has been quite an excited and important market. A firm of exporters quietly bought up practically the whole available stock, and astonished the trade on the 24th ultimo by demanding 11*s* for Rio and 7*s* 9*d* per lb. for Carthagena, which prices compared with 9*s* 6*d* and 6*s* 3*d* accepted at the auctions on the previous Thursday ; these advanced rates were paid, and immediately values rose by bounds until 12*s* 6*d* was paid for Rio (subsequently 15*s* asked) and 9s for Carthagena root. Early in the week Carthagena sold to arrive at 6*s* 6*d* per lb. c.f.i., but this last was not maintained.

Game Protection in Ceylon.

With an energetic Secretary, Mr. North C. Davidson, pulling the wires, the Ceylon Game Protection Society is doing excellent work, and now that the Governor of the Island is a sportsman, real progress is being made. Mr. Davidson, in his annual report, shrewdly remarks that as veterans who no longer shoot still pay their subscriptions for the benefit of the sporting community generally, so, too, "young planters and others should bear in mind that the C. G. P. S. is making efforts to protect game for the young planters' shooting in the near future as soon as the said young planters can afford the time and money to go in pursuit of it, and they should plank down their R.5 each."

India-Rubber in Peru.

India-rubber is the principal product exported from the Amazonian region of Peru. According to statistics published there by a financial paper, the quantity exported in 1894 was 1,294 tons, valued at £179,437 1., but according to Mr. Rhind's report on the production, commerce, and finances of the States of Amazonas and Para for 1895, the quantity of the rubber exported through from Peru through Pará during that year was only 783 tons, valued at about £145,000 1. Mr. Rhind's statement may be regarded as the correct one. Of late a considerable decrease in the export of this product appears to have taken place, as in 1890 as much as 1,163 tons were exported *viâ* Pará.

Pineapples.

Writing from Florida, a correspondent says :—"To give you an idea of the value of an acre of pineapple plants—shed and all—I will say that an acre was sold here the other day by E. F. Sperry for $3,000 to a Northern gentleman as an investment With ordinary good luck and no freezes, the product of this acre will repay the purchase price and leave a good, comfortable balance in the bank at the end of the first year. Two pineapple growers here (Van Houton and Thornton) have just completed filling an order for 85,000 plants to go to Jamaica, the price being 10 cents each. They were the product of about six acres of land, the fruit being extra to be added to this income. Can you tell us of any crop under the sun, grown anywhere, that will beat this?"

What is Manure?

Says an American writer :—"If the commonly accepted theory about manure and manuring be true, our waste and refuse matter would pollute the soil. The new light shining for the scienti-

fic farmer is proving to be the truth, and answers "What is manure?" "What is humus?" "How does humus perform a part second only to the soil itself in converting manures and fertilizing matter into available plant food?". The new philosophy proves that the soil is only a medium, that the countless numbers of bacteria attack manurial matter in the warmer season in the field and in the manure heap at all seasons, digest it and reconvert it into plant food. It tells how to build up the soils so as to make more plants. More plants mean more animals, more animals mean more gold for the farmer, and more manure to make the soil still richer."

St. Andrew's Coffee Stands.

There are, in different parts of New York, five coffee stands, at any one of which the hungry and thirsty may be satisfied for a pittance. These stands are partly self-sustaining, any deficiency being made good by the St. Andrew's Society, which sells meal tickets, and is supported by donations of those disposed to aid a worthy benevolent enterprise. The poor wayfarer may obtain a cup of good hot coffee and a roll for one cent, or a plate of beans or other palatable and nutritious food. If some philanthropic Native gentleman would but apply the same principle in a few of the chief towns in India, he would not only benefit the poor but help to solve the problem how to stimulate Indian demand for coffee. And the same plan might be adopted with regard to tea.

A Curious Story.

A correspondent writes to a contemporary :—"I read a strange story some little while ago, which ran somewhat as follows :—Many years ago, a case of butterflies was sent from Assam to England. A professor on entomology on examining them pronounced some to have come from China, but was told that such was not the case, as all had come from Assam in India. On receiving this reply, he remarked, "If that be so, there must be tea in Assam, as such and such butterflies feed only on the tea plant." This extraordinary statement being reported to the Court of Directors, they ordered enquiries, with the result that the wild tea forests of Assam were discovered. Can any of your readers inform me how this yarn could ever have arisen? I can find no trace of it in any book on tea." It would be interesting to know *where* the story first appeared.

Colombo Tea Sales.

At the public sales of Tea at Colombo on the 8th instant, about 6,670 pkgs. = 522,245 lbs. were offered, of which about 6,074 pkgs. = 479,460 lbs. were sold. The *Times of Ceylon* remarks :—"The small tea sale marked a distinct rise for nearly all grades. This was especially noticeable in all leaf kinds which, in many cases, showed a rise of quite 2 cents. per lb.; quality offering was fair for the time of year Among the finest teas in the sale were: Queensland, St John's, Naseby, and Mocha. Among low-grown teas, good invoices were offered from Polatagama, Weoya, Rondura, Rayigam, Ravana, and Kelani. Two invoices were offered to-day for sale from St. John's and Queensland. The former averaged 68 cents. and the latter 55 cents. Queensland B. O. P. fetched 88 cents., and St. John's 79 cents. The Orange Pekoe from St. John's was bought for the Russian market."

Tea at Dibrugarh.

A correspondent writes :—"A number of planters in this district have been, and are now, eradicating plots of poor *jât* China and planting indigenous plants on the same places where the China has been producing fairly average crops for, say, the last thirty years. Now after a few years there is no perceptible difference between those plots, and pieces which have been planted out on new extension (*i,e.*) where large forest trees have been cleared away before planting. That there is a great difference during the first two years can be easily understood by any one having knowledge of soils The rich deposit of almost pure vegetable matter found on all land previously occupied by large forest trees, has an extraordinary stimulating effect on the tea bush ; more especially if a 15 or 18-inch cubic hole has been dug out for the reception of the plant and the top spit turned into the bottom of the hole."

Castilloa Rubber.

Mr. Rhodes James is not alone in his desire to try Castilloa and Coffee together. There is an inquiry from Burma for Castilloa seed to try on a coffee plantation (up to 3,000 feet elevation) on the Toungoo range in Burma. For fifteen years coffee was grown profitably without the leaf fungus ; but at last the disease reached this out-of-the-way solitary estate. The owners write to the *Ceylon Observer* :—"In the first instance, we have decided to try and resuscitate coffee, but it will be necessary to introduce a new strain of seed before doing so. Do you know of a good seed which you could recommend? [The *Ceylon Observer* has recommended Blue Mountain, Jamaica seed.] I should also like your opinion on the suitability of growing Castilloa rubber. I find Ceara does very well here, but imagine the price is not nearly so remunerative as the former. The highest portion of the estate is barely 3,000 feet above sea-level and most of the land a good friable soil."

Import Duty in Canada.

People *in England* are beginning to think the duty on coffee might as well be removed, it yields so little ; but the *Times of Ceylon* continues to urge that if there is to be a duty on Tea *in Canada* there should be a corresponding duty on coffee, and that "this, of course, should be equally in favour of British growers of that product ; but what has taken place in the United States justifies our keen interest in seeing that a competing drink like Brazilian, Central American, and Java coffee is not allowed to enter Canada free. Coffee has become very cheap, and to give it a further important advantage would be decidedly against our interests." Our contemporary adds :—"Very little coffee is grown on British soil now, and most of this comes from the Straits and South India. Coffee planters in these countries would be benefited by our proposal as against foreign cultivators ; and at the same time we, as

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton :—

61·50 lbs. Nitrogen.	14·92 lbs. Lime.
57·38 „ Potash.	13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

a tea-producing country, would not be handicapped." The capabilities of South Africa are overlooked, as also is the fact that coffee really does not come seriously into competition with tea in British countries. There is room for both.

The Florida Velvet Bean.

When the last Mail received left Florida it was harvest time. Picking, threshing and stripping were in full swing. Everybody, it was observed, seemed to want to try this phenomenal forage and fertilizing plant, and consequently the call for seed was heavy. It was remarked indeed that "cotton, sugar cane, and oranges are liable to take a back seat as a money product in favor of pineapples, velvet beans, and tobacco—the three new favorites." The chief advantages of the Florida Velvet bean may be briefly recapitulated. It is very prolific, producing a large amount of seed and much forage. The fodder if cut when the vines are green, is eaten eagerly by stock. When the plant is growing it may be pastured without material injury. In common with all legumes it is a soil renovator. It is claimed to be a standard crop in Florida, and recently an effort has been made to introduce it all over the United States, and seed was distributed in many States and in Europe. A correspondent of *Indian Gardening* states, by the way, that the bean is being grown at an elevation of 5,000 feet on the Nilgiris, facing north, but the plant does not seem to thrive for some reason.

Rubber in Brazil.

Mr. A. Scott Blacklaw writes to the *Ceylon Observer* that Indiarubber has not escaped the attention of the coffee planter in Brazil. A great deal of writing in the newspapers during the last six months has induced the public authorities to encourage the production, by procuring seed, and selling it at cost price, or even below that, to planters; and to small farmers who will promise to plant it, it is given gratis. *Pará Rubber* will not grow in the Coffee Districts so far South as Rio and S. Paulo, but there are other two kinds—first: the *Mangabeira* (*Hancornia Speciosa*). It gives a delicate fruit, called in Brazil Mangaba, which is said to be harmless to sick people and in the Northern States of Brazil where it grows wild in the forest has the name of "fruit for the sick." The rubber from this tree has been exported from Bahia and Pernambuco for some years, but not in large quantities. It sells at less than the Pará Rubber. Judging by newspaper reports, this tree is being planted on a large scale in the west of the State of Rio Paulo. Second: *Ceará rubber* (*Manihot Glaziovi*) you are already well acquainted with. It is being distributed in the State of Rio. It will grow in any part in Brazil, but hitherto has been exported only from Ceara in the north. Its price has kept low owing to the careless manner of collecting.

GENERAL ARTICLES.

PIONEERING AND PLANTING IN COIMBATORE, S. INDIA.

A Planter writes to the *Ceylon Observer* under date Feb. 3rd.—The weather is very bright and fine over here and jungle is being felled on several blocks and there have been some good burns.

A Mr. Fox, from Knuckles, came over here to take charge of Messrs. Finlay Muir & Co's land, but unfortunately he has fever in his system and the new clearing work seems to have brought it out badly and so he had to leave. He also brought some Sinhalese, but they were a discontented lot, evidently expecting little work and lots of pay; and so the beauty and size of our jungle frightened them away. Though my Sinhalese people have had some rough times, yet with a few exceptions they have done splendid work and are quite happy, looking forward to going to "Lanka" in March, with a nice little sum to enjoy their New year, and I have no doubt that several will come back here again later in the year.

There are a good many iron-wood trees in the jungles here and also some very fine cedar trees, red and white, three or four feet in diameter. My bazaar is all built of cedar; it is built after the fashion of bazaars in Ceylon and is much patronised by Appuhamy and Ramasamy. My head carpenter finds the work to his taste here and has gone to fetch six more of his trade to assist him.

The next estate has a field of coffee planted last year which is coming on splendidly.

TEA CULTIVATION IN BRAZIL.

Owing to the low level of Coffee prices, Tea cultivation has been seriously contemplated in Brazil, Mr. A. Scott Blacklaw writes to the *Ceylon Observer* that an acquaintance, Col. Joao Antonio Alves de Brito, who owns a large Coffee Plantation in the borders of Minas and Rio, says that he had ordered through his agents, Tea seed enough to plant two hundred acres of virgin forest land. The seed to be the best kind grown in Ceylon. Mr. Blacklaw adds:—

"I did not press him or give him encouragement to go in for tea cultivation indeed I told him it would be a losing game attempting to compete with Ceylon and India, where labour was plentiful at from nine-pence to a shilling a day, while here in Brazil it was scarce and cost from two shillings and six-pence to three shillings. He replied that Ceylon and Indian Teas had been selling here, and in other parts of Brazil, at never less than twelve milreis a kilo for some years; at exchange of eight pence per milreis this was equal to three shillings and eight pence per lb. On his tea—which would be all absorbed by local consumption—there would be no duty, and this would pay even with the extra cost of production, better than Tea in Ceylon and India, which sold for nine-pence to ten pence. But I said, "competition in growing, and filling up the local market would bring down the price."

"Future competition!" he cared nothing for that, he would be the first in the field, and would make a large pot of money before others had time to develop Tea plantations.

This gentleman, Col. Joao Antonio Alves de Brito, is a member of the Union Parliament at present sitting in Rio de Janeiro, but he has been absent on leave for over a month. His properties are on very high land on the borders between the State of Rio and Minas. The district is not subject to dry spells, but receives regular rains, and as far as climate goes is very suitable for tea planting. His coffee plantations bear well and he is well supplied with Colonist labour.

WILD AND CULTIVATED TEA IN SOUTH CHINA.

Szemao, or Esmok, Mr. Jamieson tells us (*N.-C. Herald*), in the Report to Lord Salisbury which we noticed two days ago, is the most southerly town of any importance in China, and is situated in a pleasant little mountain plain 4,400 feet above the sea, five days east of the Mekong, in latitude 22° 47′ north. To reach either the provincial capital or Mêngtze involves a journey of eighteen stages, and the nearest posts on the French and British frontiers are respectively five and thirteen stages off. The staple industry of Szemao is the preparation of the celebrated Pu-erh tea in which some twenty-five firms are engaged, of which seven or eight are only brokers. There are five tea "hills," as the Chinese call them, in what is technically the Pu-erh prefecture, south-east and south-west of Szemao on the left bank of the Mekong. Mr. Jamieson gives a table showing prices and particulars of the different kinds of leaf, which may be of interest if Pu-erh tea ever becomes appreciated in Western markets, and gives some particulars of the duty and likin paid on it. He then discusses the total output, which it is not easy to discover, Chinese having no tendency whatever towards the collection of statistics. He says that the merchants value the total trade of Szemao at 130,000 to 140,000 taels per

annum; but after working out the figures given him of the duty and likin collected, he puts the real value of the total trade at about 230,000 Taels. Then he gives an interesting account of the double duty on tea which is collected during three months of every year, although theoretically the collection of duty remains uniform throughout the year. Mr. Jamieson gives a brief account of the tribute tea which is sent annually to Peking, and of the mode in which the tea is made up into cakes, the whole secret, as pointed out by Mr. Bourne, consisting "in a judicious arrangement by which the delicate young leaves are made to take up a conspicuous position on the outside of the cake, the coarser leaves being carefully stowed away in the centre." Mr. Jamieson adds that "Dr. Augustine Henry, the well-known authority on Chinese botany, has found wild tea on the mountains south of the Red River, and is of opinion that tea occurs wild in the mountainous belt running from the south of the Red River through Yunnan to Assam, where also it has been found in a wild state He informs me that among the numerous specimens found elsewhere in China, Formosa, and Japan, there is not one which can be considered as undoubtedly from wild trees."

TEA GROWING IN THE CAUCASUS.

Writing on the agriculture of the Trans-Caucasus for 1898, the British Consul at Batoum states:—

"The tea plantations in the neighbourhood of Batoum continue to occupy the serious attention of a few Russian tea planters, who appear to be more or less sanguine as to the ultimate results that are likely to be attained Messrs. Popoff have erected a factory for manipulating tea on one of their estates near Batoum, and have gathered their first crop this year, but I regret to say that, owing to the mystery with which they attempt to surround their industry and the secrecy which they maintain in respect to all matters concerning their plantations and the cultivation of tea on them, it is quite impossible to procure information of a reliable nature in regard to them. Although the tea crop from these gardens was all forwarded to Moscow and St. Petersburg, it does not, according to the St. Petersburg papers, appear to bear comparison with the imported article in general use in the Russian Empire.

"The Imperial Domain authorities expect to obtain a crop next season, and are making preparations for the erection of a factory on their estates, and I am given to understand that the order for the buildings and plant has been placed in the United Kingdom. It seems probable that the results of tea-growing on the last-mentioned estates stand a better chance of success than those obtained on the other estates, thanks to the fact that they have not confined their sowings to one quality only, but have laid out plantations of several kinds, of Indian teas as well as Chinese and Ceylon hybrids. By adopting this rational course they will be able to judge which quality is more especially adapted to the prevailing climate and other local conditions. Their acreage under tea has been largely increased during the present year.

"I may here mention that, according to the opinion of persons who have had a wide experience in tea-planting in other parts of the world, the only favourable portion of the Caucasus for tea-planting is the coast land situated between Soukhoum and the Turkish frontier, the general aspect of the land being southerly, and, therefore, sheltered by the hills from the very cold winds which strike their northern slopes. The rainfall is fairly evenly distributed throughout the year, the driest months of the year being, I should think, as a rule, May and June. The heat is never too excessive for tea-growing. Labour, I believe, is expensive as compared with prices paid in India and Ceylon, and the hands available are of course entirely ignorant of the principles of gardening; but I am of opinion that this difficulty could easily be overcome if tea-planting in this district became general, as labourers, being sure of obtaining permanent work on the plantations, would be sure to flock to this district from the surrounding country, which only grows a poor quality of maize, and is not very remunerative. Up to the present diseases among the tea plants have been *nil*."

PRODUCE AND PLANTING.

Tea and the Duty Question.—The revenue derived by the Customs from tea during 1898 was £3,923,566, in lieu of £3,856,663 and £3,796,425 in the two former years. Those tea proprietors who think that the reduction or total abolition of these duties would be prejudicial to their interests need not fear that the Chancellor of the Exchequer will be in a hurry to abandon such an easy source of revenue. Considerable political pressure would be necessary before the official mind would be induced to forego this contribution to the national exchequer. The desire to please the consumer, therefore, will have become more intense than it is at present ere any important change is made.

The Duty on Coffee and Cocoa.—As compared with tea, coffee and cocoa play quite unimportant parts as their contribution to the Government till. The yield of the former was only £175,565, and on the latter £191,073, showing about the same figures as in former years.

Indian Tea and the Thibetan Market.—The Thibetan market would be a great advantage to Indian tea planters, and if this "splendid outlet," as the *Globe* describes it, were open, it would no doubt prove particularly useful just now. There, however, as our contemporary points out, lies the difficulty; the country, although ostensibly under mere Chinese suzerainty, is governed by a host of Celestial officials who set their faces resolutely against the importation of Indian tea. Their main reason for this hostile attitude is that they make fine pickings out of the duties they levy on imports from China, a source of income which they believe would shrink miserably if the embargo on the Indian competition were removed. The Indian Tea Association knows all about it, and it will no doubt do all that is possible to secure a Thibetan market for Indian tea.

Londoners as Tea Drinkers.—Some statistics on the subject of London thirst show that while no less than 275,000,000 gallons of water find their way annually down the throats of Londoners, its tea drinkers are an army of millions, and call for twenty-five million pounds of tea, which, when reduced to liquid consistency, means something like 1,250,000,000 pints or nearly a pint for every inhabitant in the world. London's teapot, if properly shaped, would comfortably take in the whole of St. Paul's Cathedral, for it contains over 928,000 cubic yards.

Last Week's Tea Sales.—The comment of the *Produce Markets Review* on last week's tea sales is as follows: "The market for Indian tea continues active at a further advance, in many cases, and nearly the whole of the large supply offered has been sold. According to the most recent reports the shipments available for this market are likely to be somewhat short of last year, attributable in a measure to the increased export to other markets The difference as compared with the previous season in the quantities sent to the latter is as follows; 22,612,000lb, against 15,972,000lb, of which 14,751,000lb were this season shipped direct from India, and 7,855,000lb from here, showing the important increase of about 40 per cent. As there is evidently an increasing taste for this growth in other consuming countries it is highly probable that greater strides will be made in this direction in the future, as when once the taste of Indian tea is acquired a material development in the consumption generally follows. This will have the effect of relieving this market of the larger production that may be looked for, owing to the extended cultivation during the last few years, and should at the same rate of progress absorb the surplus growth over the requirements here The supplies of Ceylon teas brought forward this week have been only on a limited scale, and firm, with occasionally higher, prices were paid all round. Whole leaf descriptions were more particularly in request, and the medium grades were keenly competed for, previous values being well maintained. Teas for 'price' were much sought after; the market for this class being, if anything, dearer than last week, and 5¾d is now practically the lowest quotation, while even at this price there is not much to be obtained"

Indo-China and Produce Prospects.—M. Doumer, the Governor General of Indo-China, is now in France, where he is engaged in expatiating upon the glories of the fine domain "three times the size of France," which he governs. It is to be a great market for French manufactures, and as for produce, there are no bounds to the prospect it offers. The first step, M. Doumer pointed out, was to apply intelligence and capital to the cultivation of rice, tea, coffee, pepper, dyestuffs, and other tropical products for the French markets, in order to displace those now received from English dependencies. Already this substitution had been accomplished in respect of pepper. Next in importance was the construction of public works, and here the propect was excellent, for the financial condition of Indo-China was "incomparably flourishing." Already

the Colonial Administration had devoted considerable sums to these objects, £40,000 having been spent upon irrigation works in the rice-growing districts, and £100,000 on canals and on the improvement of navigable rivers. The exports of rice from Cochin China amounted to between £1,600,000 and £2,000,000 per annum, and those of Tonquin to about one-eighth of these sums. As yet the exports from Annam and Cambodia were comparatively trifling, because of the want of means of transport in those parts of the colony. Efforts were being made to supply the deficiency, and the cultivation there of the more valuable products had been begun—that of tobacco, for example, had been introduced from Sumatra. A start had also been made in the growth of tea and coffee in Annam, and progress had been accomplished in the production of raw sugar, which was at present refined at Hong Kong. When, however, refineries were set up at the place of production markets would be found for the production in Southern China and in Japan. The cotton grown in Cambodia was exceptionally fine, and nearly all of it was sent to China. M. Doumer added that he anticipated the establishment of a very large trade before long between Indo-China and Yunnan.—*H. & C. Mail.*

COFFEE AND EXCHANGE IN BRAZIL.

Writing from Brazil to the *Ceylon Observer*, Mr. A. Scott Blacklaw, says:—When I last wrote to you

THE PRICE OF COFFEE

was so low it could scarcely pay for production, and in places where pack-mule or bullock-cart transport made it costly to take to the nearest railway station, it has been produced at a loss—even now although the crop at present being shipped is expected to be much less than the former one, the price has not risen. It has not been much above 6 cts. per lb. for No. 7—the middling Brazilian Type in New York. It was believed that the crop for 1898-99 would be a short one, and that the seasons were unfavourable, but somehow the buyers in consuming countries seemed to wait for a lessening of the number of bags being received by rail in Santos, and Rio de Janeiro. With the exception of the two months July and August, between the old and the new season's shipments, there has been little diminution, and both ports continue to receive equal to last year's quantities, and stock in Rio and Santos as well as in consuming countries are large.

There is a great uncertainty as to the quantity expected for season 1898-99, but some authorities which can be relied on put Santos at 6,500,000 sacks of 132 lb. each, Rio 2,000,000 to 2,500,000 sacks; but such conflicting reports have been received as to the ravages of dry weather from July to November in the districts which have Rio for a shipping port, one cannot form a safe calculation, and to make it too high is to bring a hornet's nest about one's ears, for planters believe that low prices continue because of exaggerated estimates made beforehand, and the newspapers are open to attack any poor unfortunate who ventures on this precarious ground.

As is usual in all coffee-producing countries, a long spell of dry weather immediately before blossoming time, brings out a copious flower after the first rains; the same has occurred here during the flowering time—latter end of September, October and beginning of November,—but since then there has been rain almost every day; nice refreshing evening and night showers say I, but a lot of newspaper reports say embryo fruit is rotting and falling off in many places.

EXCHANGE.

The low rate of exchange all during last year, certainly favoured the coffee planter, for although the price was low in consuming countries, it represented gold, and owing to the low rate of exchange, the amount in currency came to a respectable sum. Colonist labour was fairly plentiful at not much above the former rates. Therefore the cost of production was not much above what it used to be when exchange was high During the latter end of 1897, exchange ranged from 7d to 7¼d per milreis—thirty-three to thirty-four milreis to a pound sterling. In the first five months of this year it fell from 7d to 5⅝d per milreis raising the pound sterling from thirty-four to forty-two-and-a-half milreis—the par value of the milreis is twenty-seven pence—or eight mil eight hundred and eighty-eight reis to a pound sterling.

This state of matters if favouring the coffee planters, was the opposite of cheering to commercial people; to the poor people in the towns—for whom nearly all the necessaries of life had to be imported, and therefore had to be paid for in gold—it meant semi-starvation, and to the Government with its gradually diminishing revenue—owing to *protective*, one may say *prohibitive*, duties on all imports—who had to meet annual payments in Europe of over three million pounds sterling: this low exchange was indeed a blue look out.

In July of this year,

A FINANCIAL ARRANGEMENT

was made in London, and after that exchange rose in a short time to 8⅝d; although it has not remained at that figure, it has not fallen much below it, and it is expected—if the Government is able to fulfil its part of the contract which if public men are in earnest it can have no difficulty in doing—the value of the milreis will rise to eighteen pence in three years

I need not inflict on you and your readers the dry details of this arrangement, or "accordo," as it is called here, but in a few words it is this:—

1st. A loan of ten million pounds at five per cent.

2nd. The amortization of the external debt is suspended for thirteen years.

3rd A yearly sum of three million pounds is to be taken out of this loan for three years. This sum is to go towards the payment of interest on the external debt, and guaranteed interest on railways, as well as salaries and expenses of representatives of Brazil in Europe and other payments, such as railway materials, &c

4th. The Government is not relieved from the payment of these sums, but only relieved from remitting to London. The equivalent of these amounts have to be paid in paper money calculated at eighteen pence per milreis, into one or more of the foreign or national banks (nearly all of them get a part of it) as a deposit, and from time to time the paper money forming this deposit has to be destroyed.

Two results are expected from this "accordo":—first, the Government not requiring to enter the market for remittances to Europe, exchange is sure to rise. Second, a large amount of paper taken out of circulation will increase the value of what is left.

TEA, &c., COMPANIES.

Nyasaland Coffee Company, (Limited).—At the Annual Meeting of the Nyasaland Coffee Company, held in September last, the report and accounts were adopted. The accounts show that R63,742·30 had been absorbed in developing the Company's properties, and that there was in hand a balance of R28,537·70.

A general meeting of Shareholders was held at Blantyre on 24th December 1898. The following report was presented:—

Acreage:—10 acres Coffee planted December 1895. 240 acres Coffee planted December 1896—February 1897; 383 acres Coffee planted, December 1897—February 1898. Total 633 acres under cultivation; 2,843 acres reserve. Total 3,476 acres.

Progress of Work.—During the financial year under review 383 acres were felled, cleared and planted. The Directors, however, regret to report that owing to scarcity of labour and heavy growth of weeds due to an abnormal rainfall, the clearings have not been a success, and will require much supplying. The scarcity of labour has been occasioned by disturbances in the districts from which labour is recruited, but these having now been suppressed and the natives pacified, the Superintendent anticipates that he will not experience further difficulty in this direction.

Estimate for Season, 1898-99.—Under the circumstances reported above, the Directors do not consider it advisable to attempt to open further land this season. They have instructed the Superintendent that last year's clearings must be fully supplied next rainy season, and nurseries for this purpose have been laid down. A crop of some 3 or 4 tons may be secured this year, but it is left to the discretion of the Superintendent as to whether it is advisable to allow the trees to bear any crop or not.

Finance.—The attached accounts close the Company's books to the 30th June, 1898. To this date R63,742·30 has been absorbed in developing the Company's property, and there remains a balance in hand of R28,537·70, which will cover the expenditure for the current season. Store buildings and machinery will have to be erected in season 1899-1900, but the crop of that season should more

than provide for these and ordinary working expenditure. Prices of Nyasaland coffee have been well maintained notwithstanding the general fall in price of coffee.

Mazawattee Tea Company, (Limited):—The report of the directors of the Mazawattee Tea Company (Limited) for the year to December 21 last states that the board have to record the most satisfactory year in the history of the business; satisfactory as regards every department, and from every point of view. The profit and loss account shows that the profit on trading amounts to 60,360*l.*, as against 56,695*l.* for the previous year, showing an increase of 3,654*l.* More particularly, the volume of trade has surpassed the expectations of the directors, and shows a large percentage of increase over that of any previous year. Some idea of the magnitude of the business which the shareholders in the Company possess can be gathered from the fact that on April 27 last the Company paid for Customs duty on British-grown tea only a cheque amounting to 63,000*l.* odd, which is over 12,500*l.* more than any other cheque that has ever been paid for tea duty. The balance brought forward from the profit and loss account of 1897 was 20,833*l.*, out of which there has been paid dividend on the preference shares 4,833*l.*, dividend on the ordinary shares 13,533*l.*, commission to directors (1897) 521*l.*, together 18,888*l.*, leaving a balance of 1,945*l.*, which, with profit on trading, 60,360*l.*, and transfer fees, 146*l.*, amounts to 62,451*l.*, which is dealt with as follows:—Managing directors' remuneration and directors' fees, 1,600*l.*; office expenses and other charges, interest on loans, and amount written off for depreciation of leases and plant, 5,731*l.*; placed to reserve, 15,000*l.*; further, an interim dividend has been paid on the preference shares at the rate of 5*l.* per cent. per annum, and on the ordinary shares at the rate of 8*l.* per cent. per annum, amounting to 18,366*l.*; a dividend at the rate of 5*l.* per cent. per annum is due on the preference shares for the half-year ended December 21 last, and the directors recommend a further dividend at the rate of 8*l.* per cent. per annum for the half-year on the ordinary shares, which will together absorb a further sum of 18,366*l.*, together absorbing 59,064*l.*, and after making these payments the amount of 3,387*l.* will, subject to such sum as may be voted for the commission of the directors, form the balance to be carried forward.

After reading the above Company's report, a correspondent wrote to a London paper that it occurred to him to refer to the original prospectus, and to compare the profit earned for the past year with the average of the three years previous to flotation. "I find," he says, "the accountants return the average income for that period as £45,798 16s., against a profit for last year of £60,359 15s. 8d. Rarely, I think, has a business shown such a remarkable record on being issued to the public. The amount placed to the reserve will bring that item up to £39,000; yet the price of the shares to-day is only 28s. cum. div., against £2 on being first issued to the public." "We fear it is too true," says a financial contemporary, "that the public is not even yet fully alive to the merits of tea shares."

The High Forests Estates Co., Ltd.—The Fourth Annual General Meeting of the shareholders in this Company, was held at the office of Messrs. Whittall & Co., Colombo at 11 a.m on 11th instant, Mr. J. G. Wardrop presided.

The Annual Report said:—ACREAGE.—Tea in bearing, 432 acres; tea in partial bearing, 156 acres; tea planted in 1896, 246 acres; tea planted in 1897, 174 acres; tea planted in 189-, 132 acres; forest and patna, 492 acres—total 1,632 acres. The total crop harvested during 1898 was 221,028 lbs. tea, which realized a nett average price 50·72 cents per pound compared with a nett average price of 44·69 cents in 1897. The improvement in price may be considered very satisfactory, in view of the state of the tea market during the year.

After making the usual provision for depreciation of buildings and machinery the result of the year's working shews a profit of R37,416·17, to which has to be added the balance of R2,739·30 brought forward from 1897. The Directors now recommend a dividend of 4 per cent. per annum on the capital of R875,000, at 31st December, 1898, and at the rate of 4 per cent. per annum on the capital of R50,000 called up during the year and made payable on 15th March, 1898, which will leave a balance of R3,560·47 to be carried forward to the current year's account. During 1898 a sum of R26,969·03 was expended on capital account, viz., R24,535·74 on the opening of 132 acres and the upkeep of 420 acres not then in bearing, R2,223·10 on buildings, and R210·19 on machinery. During 1899 the expenditure on capital account is estimated at R21,226, which includes the cost of 30 maunds of tea seed and nurseries, of opening up 25 acres tea and of the upkeep of the acreage not yet in bearing It is not anticipated that it will be necessary to make any call during this year on the holders of part-paid shares, but in 1900 it will be necessary to make a call to cover the cost of increased factory accommodation which will then be required to deal with the increasing quantity of tea coming in from the acreage planted in 1896-97. . . . . The yield of tea in 1899 is estimated at 230,000 lbs. on an expenditure of R64,132·62 on the estate. It was resolved that a dividend of 4 per cent. per annum be declared and paid forthwith.

The Kalutara Company, Ltd.—The Third Annual General Meeting of shareholders in this Company was held at the office of Messrs. Whittall & Co., at 11-30 o'clock on the 11th inst., Mr. J. G. Wardrop presided. The Report stated:—

ACREAGE.—Tea in bearing, 426 acres; tea in partial bearing, 117 acres; tea not in bearing, 115 acres; arecanuts, grass, ravines, &c., 10 acres; forest, 416 acres—total 1,084 acres. The crop amounted to 255,130 lbs. tea including purchased leaf, which realized a nett average of 33·8 cents per lb. against 36·87 cent per lb. in 1897, on an expenditure on the estate of R55,382·65, equal to 21·71 cents per lb. of tea, which included a sum of R3,038·38 spent on manuring 100 acres, and R1,124·21 for the purchase of 27,887 lbs. leaf. The new withering shed, which was urgently required for the efficient manufacture of the teas, should have been completed in April, but, owing to delay on the part of the contractor, it was not finished till well into October. Since its completion the quality of the teas has improved, and the Directors think they may fairly anticipate better prices during the current year. About 10,000 rubber plants have been put out in suitable places on the estate, and their growth shews promise. The Directors also considered it advisable to prospect for plumbago, and with this object a sum of R961·67 was spent on this work, of which R206·58 was recovered by sale of the plumbago mined. For the past two months the heavy rainfall has stopped the work, but when the weather settles, it is hoped that arrangements can be made with natives to work the pits on the share system. After making ample provision for depreciation of buildings and machinery, writing off the balance of expenditure on plumbago, and a sum of R500 to a Coast Advance Reserve account, there remains a balance at credit of profit and loss account on the year's working of R15,325·83, after payment of dividend the on the preference shares. To this has to be added the balance of R20,448·83, brought forward from last year, making a total of R35,774·66. Of the R50,000 which the Directors were authorized to issue in cumulative preference shares of R500 each, only 35 shares have been subscribed for during the current year, and the Directors therefore recommend that, in order to provide part of the further capital required to balance the expenditure already incurred, the sum of R20,000 be transferred from profit and loss account to an Extension Fund account, and that a dividend of 3 per cent. on the ordinary shares be declared for the past year. This will absorb R32,000, leaving R3,774·66 to be carried forward to next year. The estimate of crop for this year from the Company's estates is 285,000 lbs. tea on an expenditure of R64,411·86, which includes the cost of manuring 150 acres. During 1898 R23,913·15 was spent on capital account on the erection of a withering shed, additions to machinery, a cart road between the two estates, the planting of rubber and upkeep of acreage not in bearing, and the estimate for 1899 is R8.538·41, chiefly for a new set of lines, balance of withering shed account, planting of rubber, further expenditure on cart road, and upkeep of tea not in bearing.

A dividend at the rate of 3 per cent for the year 1898, was declared and made payable.

The Upper Maskeliya Estates Company, Limited.—The Annual General Meeting of this Company was held at the office of Messrs. Whitall & Co., at 12 noon, on 11th inst., Mr. A. E Wright presided. The Report stated:—

ACREAGE.—Brunswick and Bloomfield: Tea in full bearing 446; Grass, timber trees, &c., 72; Total 518 Caskieben: Tea in full bearing 200; Tea not in bearing 7; Total 207. The crop for 1898 was estimated at 323,000lbs. of tea on an estimated expenditure of R.92,300 on the estate; the Directors regret to state that the crops have fallen far short of their expectation. The Visiting Agent in his last report states that the estates have been, and are, in excellent heart, and that the shortfall can only be attributed to climatic influences, and in support of this the Directors are glad to say that for the first twenty days of the current year the yield shews an increase of over 6,000 lbs. made tea over the quantity harvested for the same period last year. The

total crop secured was 256,032 lbs. made tea, which averaged for the quantity sold 39·76 cents per lb. as against 42·51 cents last year. The capital Account outlay for 1898 amounted to R.5930·34, chiefly for additions to machinery and the erection of boutiques. After writing off for depreciation of buildings and machinery the sum of R.3.23·25, which brings the Depreciation Account up to R30,000, a balance of R18,124·36 is left at the credit of Profit and Loss Account, and the Directors now recommend a dividend of 5 per cent. for 1898, leaving a balance of R624·36 to be carried forward to the current season's account. The crop for this year is estimated at 300,000 lb., against an expenditure on the estate of R87,659, which includes R10,374 for manuring 253 acres.

A dividend of 5 per cent. for the year 1898, as recommended in the Report, was declared and made payable forthwith.

VANILLA.

The following interesting review of the trade in 1898, notes on the cultivation and preparation of the Vanilla Bean, &c., have been contributed by Messrs. Brookes and Green, brokers, to the *London Commercial Record*:—

The year which has just closed was noticeable for the fairly high range of values of Vanilloes, and the result must have been very satisfactory to those planters who succeeded in getting fair-sized consignments of the article forward to public sale. The first auctions of the year 1898 were held on 14th January, when 1,143 tins (being a "record" for the high quantity in one series of sales) were submitted to buyers, and with a large attendance of the home and export trade met a splendid demand; altogether about 1,100 tins were sold at good prices all round. This result was almost entirely due to the large buying of the (English) home trade buyers, who took off fully 80 per cent. of the total quantity offered.

The above auctions, as it turned out, were the best of the whole year. During February, March, April and May a quiet tone prevailed and values eased downwards, and in the month of June several lots of Seychelles were sold in public sale at 4s. per lb. reduction upon the prices paid under the hammer in January, 1898. July showed more firmness in the market, but August and September were mostly noticeable for lower prices. The last three months of the year (October, November and December) experienced a much better demand, and prices continually advanced, the year closing with a good strong tone at high prices. During the year 1898 5,261 tins Vanilloes were offered in the London public sales and it is safe to estimate that the English manufacturers purchased fully 75 per cent. of the quantity disposed of.

The buyers who had to hold their stocks last year were serious losers in consequence of the unusually large percentage of Vanilloes which deteriorated by mould; many experts consider the goods were hurried forward too soon and not thoroughly cured.

This is such a serious matter, says our London contemporary, that we have got **Messrs. Brookes & Green** to allow us to print the following **special** Hints on the preparation of Vanilla for the London market, published by this firm in January, 1888, *viz* :—

FERTILIZATION.

Self-fertilization in the Vanilla (especially some species) to any useful extent is rather an exception owing to the intervention of the reticulum, a portion of the inner face of the style; we have always understood that artificial fertilization is desirable, the process consisting in removing the Pollen from the Anthers of the flower, and applying it to the stigma; this can be done with a small camel hairbrush or the Anther itself may be applied. This is best done at mid-day in bright weather, but if to avoid the heat early in the day is preferred, only dry mornings should be chosen for the work.

HARVESTING THE VANILLA.

When the pods are ripened, which mostly occurs in Mauritius towards the end of the month of June and throughout July, the work of harvesting commences; the Vanilla plants flower very irregularly, and, in consequence, all the pods are not in fit condition to be gathered at one time, and care is required at the first gatherings not to touch pods which are unripe; if gathered too early the pods or beans will mostly shrivel during the process of drying, and lean shrivelled beans do not realize so good a price in the markets. At the same time the pods must not be left on the plants after they have ripened, or the valves will open, sometimes nearly an inch, and split beans are of inferior value.

DRYING AND PREPARING THE PODS FOR MARKET.

Without doubt the most difficult and anxious time in the culture of Vanilla is the process of drying and completing the preparation of the pods.

All the care and success during the early cultivation may easily be lost, if through want of knowledge or watchfulness the drying process is imperfect.

The successful operation of drying the beans at the time our information refers to was as follows:—

A large oven (similar to an ordinary bakehouse oven) is heated by fire underneath, until the thermometer fixed on the iron door in front registers a heat of 103° to 105° Fahrenheit. The fire is then withdrawn; meantime pieces of wood should be prepared, laid crossways, to fit the bottom inside the oven, so as to prevent the pods actually coming in contact with the oven; upon these cross-laid pieces of wood about 70 to 75 lb. weight of Vanilla pods should be placed, well wrapped in banana leaves, which are again covered with a woollen cloth, and the whole placed in the oven, where they are allowed to remain until the thermometer falls to about 85° Fahrenheit; they are then removed and placed in a wooden box for the moisture to exude and the pods cool gradually, when nearly cold they are placed on blankets, which have been lying on boards and warmed by the sun, and the pods spread on these blankets are exposed to the sun. We have known some growers, who instead of exposing the beans to the direct rays of the sun, prefer to cover the pods with a black woollen cloth, which by absorbing a considerable amount of heat from the sun as well as moisture from the Vanilla pods assist the process of drying, and some state, impart to the pods a superior flavor and color than they otherwise would have. After thus being exposed for two or three days they should be of a dark brown color. The pods are next laid on perforated shelves in an airy room where they are allowed to remain for three or four weeks, or until properly dry, when they should be of a good black color.

SORTING AND PACKING THE BEANS IN LENGTHS AND QUALITIES.

We find all merchants are careful in keeping the size of the beans in the bundles arranged regular and even, and also the weight of the bundles are fairly correct, and upon these points they do not require any information, but we often notice the tins contain very mixed sizes; for instance, one-half of the bundles will measure 6 to 7 inches and the other 4 to 5 inches. This is a mistake, and where practicable should be avoided. If the parcel in hand is large enough for careful division, the measurements of the bundles in a tin should not vary more than half-an-inch, or one inch at the outside, thus 8 x 9 inches together, 7 x 8 inches, 6 x 7 inches, 5 x 6 inches, &c.

In bundling the beans we are well aware that it is easier to make the tie with damp rafia than when the fibre is dry, but the former should not be allowed on any account. We have seen bundles of Vanilla arrive in London quite mouldy round the tie, caused, we feel certain, by the rafia being damp when used for tieing the beans together. This, we feel sure, only requires to be pointed out to be avoided in future.

Bundles of split beans should always be sent in separate tins by themselves, and not mixed with sound beans, as this prejudices the sale; we found this mixture in some parcels we recently inspected.

First Auctions of the Year 1899.

The first auctions for the present year were held on the 5th ulto.; the catalogues included the large supply of 1,095 tins, principally new arrival from Seychelles. The crop has been late in arriving, but the improved condition of the goods raises the question whether planters would not do well to see the beans are

NOTHING EQUAL TO THESE IN THE CARNATIC.
[2-10-98—t.f.o.]

always thoroughly cured and not let them come forward in a damp or immature condition. Yesterday's important auction attracted world wide attention, and there were some good orders sent from America and Europe, **but the English home trade buyers purchased two-thirds of the lots sold;** brown beans were scarce and dearer, whilst good and fine qualities met splendid competition and sold at good prices, maintaining the high quotations ruling at the close of last year. This is a most satisfactory opening of this year's auctions, and again proves conclusively that **London** is the best market in the world for quick and complete disposal of Vanilloes.

The following particulars of present values of various qualities are copied from **Messrs. Brookes & Green's** special Madagascar and Mauritius Price Current:—

DISTRICT ASSOCIATIONS.

SHEVAROY.

Proceedings of the Committee of the Shevaroy Planters' Association at a Meeting held in the Victoria rooms, Yercaud, at 1 p.m., on Monday the 6th February 1899.—PRESENT: Rev. J. M. Kempf, Messrs. Thurston Short, S. M. Hight, J. C. Large, C. Rahm, C. G. Lechler, *Chairman;* R. Gompertz, *Honorary Secretary.*

1. *Read* and discussed existing rules with certain proposed Amendments and Alterations.

Resolved that the rules as altered and amended shall be submitted to the next Quarterly General Meeting for disposal.

2. *Read* letter from Mr. W. J. Lechler, complaining that the Constable told off to visit his estate had been very remiss.

Resolved, that a copy of Mr. Lechler's letter be sent to the District Superintendent of Police for favour of enquiry.

Read and recorded the following letters:—

15/U. W. Circular from the Secretary, U. P. A. S. I., forwarding copy of order of Government of India, stating that it sees no reason to alter the Forest Act.

16/U. W. Circular from the Secretary, U. P. A. S. I., informing that the *Madras Times* has a very interesting and important telegram on the subject of the S. of I. Planters' Enquiry Committee, copy of telegram attached.

19/D. Notification of the Government of Madras regarding certain areas in India which has been declared infected with plague.

20/D. Letter from Mr. W Mahon Daly, requesting that his name may be taken off the list of members of the S. P. A.

16/S. Letter from Mr. W. H. Stanes, informing that he cannot pay the back subscriptions but will continue to pay his subscriptions from 1st January 1899.

11/L. Letter from Mr. W. J. Lechler giving the dates that the special Constable has visited his estate.

29/C. Letter from the Collector, informing that as the Chembanarth Road is out of the Union limits, the matter has been referred to the President, Taluk Board.

The following papers were laid on the table:—

Planting Opinion, 4 copies, dated January 7th, 14th, 21st and 28th.

African Times, 4 copies, dated November 5th, 19th, 26th and December 3rd.

George White and Co., Ceylon Tea Memoranda, No. 180.

MARKET REPORT.

[*Advices per Mail of 27th January* 1899.]

COFFEE.

During the week supplies at auction have been very moderate, says the *London Commercial Record*, and no material change in value occurred. Further small quantities of East India offered, but the quality has not provided much attraction to the trade, though full relative values were obtained. Foreign growths were mostly old crop, which with difficulty sold at easier prices; the few lots of good colory new crop brought some advance. "Futures" have shown more firmness, and prices for the week are rather dearer, viz.:—

London ...	Santos ...	March delivery ...	31s 3d
New York ...	No. 7 Rio ..	„ „ ...	5·65 cents.
Hamburg ...	Santos ...	„ „ ...	31½ pf.
Havre ..	Santos ...	„ „ ...	38¼ francs
Holland ..	Good ordinary Java	„ ...	32½ cents.

Statistics of Imports Deliveries and Stock of COFFEE in London exhibit—

In the Imports a decrease this year of ...	..	1174 tons
Home Consumption a decrease of ...	...	18 „
Export an increase of	...	205 „
Stock an increase of	...	3427 „

Auctions this week have passed off as under:—

CEYLON.—*Plantation.*—11 barrels and bags sold—smalls 72s, low middling 92s, good bold to extra bold 111s to 115s, peaberry 117s.

EAST INDIA.—68 bags *Coorg* mostly sold, smalls 50s, middling 70s 6d, good bold blue 95s 6d, peaberry 102s.

COSTA RICA.—755 bags offered and 500 bags sold, smalls 29s, good middling colory 73s, good bold 87s, peaberry 79s: old crop "without reserve" good ordinary 35s 6d to 36s, low middling to middling 44s to 55s 6d, peaberry 31s.

GUATEMALA.—1,398 bags partly sold, smalls 35s to 37s, good ordinary faded greenish 40s 6d to 41s 6d, low to good middling 53s to 57s, good bold 88s 6d, peaberry 65s 6d to 76s 6d.

VERA PAZ.—Of 1,903 bags offered about 600 sold, smalls 37s 6d, good to fine ordinary 40s to 46s 6d, low middling to middling gray 50s to 62s 6d.

SALVADOR.—411 bags bought in.

VENEZUELAN.—81 bags bought in.

PORTO RICO.—34 bags withdrawn.

ECUADOR.—30 bags good ordinary bold pale 35s 6d.

MOCHA.—100 packages retired.

NYASSALAND.—117 bags sold, fine fine ordinary to low middling 51s 6d to 57s 6d.

AFRICAN.—*Liberian.*—43 bags sold at 24s to 30s for medium yellow to bold brown.

To-day's auctions consisted of 15 casks 15 barrels 4 bags Plantation Ceylon, 1,064 bags East India, 86 bags Mexican, 244 bags Nyassaland, 20 half-barrels Mocha, 29 barrels 84 bags Jamaica, 622 bags Guatemala, 150 bags Savanilla, 100 bags Bahia, 93 bags Salvador, 389 bags Costa Rica, 126 bags Colombian, 246 bags

Coban and 20 bags Santos. The sales went off most irregularly, and in some cases 6d to 1s lower.

Prices realised at auctions for the principal Marks of East India :—

TEA.

INDIAN.—Public auctions were rather lighter, viz., 47,300 packages versus 55,500 packages last week, and 44,500 packages a year ago.

A strong demand again prevailed for most descriptions at about previous rates, particularly for those with full autumn flavour, and exceptionally high prices were recorded for the choicest parcels. Quotations for common to medium whole leaf Teas, with desirable cup, were quite maintained, but the less attractive ones, as also medium to fine Broken Pekoes, exhibited some irregularity and were at times easier. Finest Orange Pekoes and Broken Orange Pekoes did not show much change.

Including what is printed for sale on Monday 30th inst., the total of the 1898 crop sold to the end of this month will be, say, 96½ million lbs., opposed to about 98 million lbs. to 31st January, 1898.

For 33,600 packages on Estate Account, 9¼d per lb. was realised, against 8¼d per lb. for 35,300 packages and 9⅜d per lb. for 34,300 packages in the two preceding seasons.

CEYLON.—A larger quantity was brought forward, amounting to 20,900 packages, contrasted with 16,200 packages on the 17th inst., and 20,000 packages at this period of 1898.

There was a better enquiry generally, and spirited competition for nearly all kinds from the Home trade, while Continental orders also were more frequent than of late.

Pekoe Souchongs under 6d per lb., and Pekoes up to 8d per lb. were in request and occasionally dearer, more attention being also given to the fine lines of Pekoe and Orange Pekoe. Fair to medium Broken Pekoes with coloury liquor, often ruled in favour of sellers, while Broken Pekoes and Broken Orange Pekoes over 1s 2d marked an advance, the following being noticeable, viz. :—Henfold Estate, 1s 7¼d; West Holyrood Estate 1s 6¼d; Talawakelle Estate 1s 6d; Campion Estate 1s 4¾d; Tillicoultry Estate, and Valamaly Estate 1s 4½d; North Cove Estate 1s 3¾d; and Kotiyagalla Estate 1s 3¼d per lb.

The average is 8¼d per lb. compared with 8⅛d per lb. in the foregoing week, and 8¼d per lb. on the 27th January, 1898.

JAVA.—Nearly 1,400 packages of direct import were included in the catalogues, which went off with good spirit well up to valuations. For the next fortnight 3,000 packages are advertised.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London Warehouses, as per official returns were :—

From 1st to 24th Jan., 1899 ..... 14,424,120 lbs.
„ „ 1898 ..... 13,491,065 „

During the week the following has been printed for sale by public auction :—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India ...	41,931	5,350	47,281
Ceylon...	19,810	1,053	20,863
Java ...	1,357		1,357
Total ...	63,098	6,403	69,501

Also 195 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon and Java Tea Report, dated January 20th, 1899, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON,
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	1,063,839 pkgs.	724,409 pkgs.	27,826 pkgs.
1897-1898.	1,080,693 „	755,036 „	26,679 „

55,638 pkgs. Indian
16,659 „ Ceylon
— „ Java
} Total 72,297 packages were offered in public auction this week.

The quantity of Tea used in the United Kingdom per head of population during 1898 was lbs. 5·85, against lbs. 5·81 in 1897, while progress was also made in the total consumed, as shown below.

Indian.—The market was strong throughout the week and is now higher than it was before Christmas to the extent of fully ½d. on Teas below 7d., and 3¾d. to 1d. on the higher grades. The general quality of arrivals is now showing some improvement, making the rise appear slightly more than is actually the case. The official wire gives exports to U. K. for the first half of January as lbs. 4,460,000, against 4,180,000 for same period last year, making total exported to U. K. from first April, 1898 to the middle of Jan. as lbs. 126,867,000, against lbs 125,320,000 last season.

Ceylon.—The small auction met with a steady demand, prices being distinctly firm, with occasional advances for good liquoring Teas, as well as for some of lower grade. Private telegraphic advice gives exports to U. K. for first half of the month as lbs. 2,300,000 against lbs 3,500,000 last year the estimate for the month being lbs. 8,000.000 against 8,000,000 shipped last year. Average for week 8·11d., against 8d for same period 1897.

Ceylon Tea sold on Garden Account, 1st Jan. to date 1899, 60,743 pkgs., av., 8·05d. 1898, 64,796 pkgs., av., 8·27d.

		1899.	1898.	1897.	1896.
PEKOE SOUG.	(Ordinary leaf; fair liquor)	6½d.	6½d.	6d.	6½d.
PEKOE	(Ordinary leaf, little twist; fair liquor)	7¾d.	7½d.	7d.	7¾d.
PEKOE SOUG.	(Rather bold leaf, indifferent liquor)	5¼d.	4¾d.	4¾d	5¼d.
PEKOE	(Somewhat bold leaf; indifferent liquor)	5⅝d.	5¾d.	5½d.	5⅝d.

Java was not represented, 1,357 packages are advertised for sale next week. 8,592 packages are to be offered in Amsterdam on the 26th inst.

IN AUSTRALIA.

MELBOURNE, Jan. 22nd.—At the auction sale this afternoon there was a good demand at full prices, but, owing to the firmness of importers a considerable proportion of the offerings was withdrawn. Of Ceylons, 40 chests and 61 half-chests were offered, and all sold, principally at 7d. to 9½d, choice broken orange pekoe fetching 11d. Privately sales have been made of about 140 chests Ceylon at prices ranging from 6d. to 1/, and 60 packages Ceylon dust.

ADELAIDE, Jan. 22nd.—Enquiries for tea have been moderate, and the sales fair in both Ceylon, India and China.—*Australian papers.*

TEA STOCKS IN MELBOURNE.

Compared with the same period last year on January 21st as follows :—

	1899.	1898.
China	1,362,121	1,734,528
Indian	431,184	716,271
Ceylon	530,922	350,121
Total...	2,324,227	2,801,160

COCOA.

Catalogues on Tuesday offered the goodly quantity of 5,856 bags which experienced a good demand, and about 3,800 bags sold, although at somewhat irregular rates. 660 bags Trinidad sold, out of 734 bags offered, at 72s to 74s 6d for good mixed to fine, showing an occasional 1s advance. Of 1,980 bags Grenada 1,650 bags found buyers at an improvement of 6d to 1s on all except the fine grades which had a tendency to ease; fine red brought 70s to 70s 6d, good 67s to 68s 6d, and common 65s to 66s. 541 bags Dominica realised fully valuations at 63s 6d to 66s for common to fair. Of 45 bags St. Lucia 5 bags sold at 66s 6d. 127 bags Jamaica sold at full prices—at 64s for ordinary. Of 807 bags Guayaquil 180 bags Caraquez sold at 72s 6d to 73s for good Caraquez, 68s 6d to 70s for gray to fair, and 70s for after-crop Arriba, the latter quality being distinctly cheaper. 40 bags Colombian and 61 bags Surinam retired. Of 1,510 bags Ceylon 650 bags were placed at 69s to 72s 6d for good medium and bold red, small and medium 63s to 68s, and pickings 55s to 61s per cwt. Private transactions comprise 100 bags Trinidad and 400 bags Grenada at auction rates, and about 800 bags Guayaquil, including summer Arriba at 80s per cwt.

PEPPER.

Black.—The market has been very firm and dearer, finishing up strong with few sellers. On the spot sales of fair Singapore have

been made at 5⅛d up to 6 3/16d, and Tellicherry at 5 1/16d. For arrival 300 to 400 tons have changed hands, viz, Singapore January March shipment at 5 5/16d to 5½d, and March-May at 5⅜d up to 5½d, also some Tellicherry at 47s 6d per cwt. c.i.f. delivered weights.

Auctions on Wednesday offered only 13 bags damaged Singapore, which were placed at 4⅞d to 5d per lb.

Fine on Friday.—Strong; 100 tons Aleppi March-May sold at 47s 6d per cwt., delivered weights New York.

Sales of 50 tons Singapore—at 5¼d spot, and March-May shipment at 5 9/16d.

White is dearer and very firm. Singapore on the spot has been sold at 8⅜d for fair and Penang at 7¾d. For arrival 100 tons Singapore January March shipment have changed hands at 8 1/16d, and 100 tons Penang January-March at 7 5/16d per lb.

At public sale on the 25th inst. 232 bags Singapore passed the hammer unsold at 8⅞d to 9½d, together with 113 bags Penang at 8d per lb.

GINGER.

Cochin.—Some small arrivals of new crop washed (the first to hand this season) met good competition and sold at higher prices, but old crop of all qualities is difficult to quit except for Calicut rough, for which a demand has sprung up on the spot, and sales of about 1,000 bags are reported at 24s to 25s per cwt. for fair, also some washed Cochin at 25s to 27s, and cuttings at 18s. The business done to arrive so far this season is very much smaller than usual, the total transactions being little, if any, over 100 tons; consequently, the bulk of the shipments will be made on consignment. There is reported to be a considerable Native demand. Offerings at auction comprised 69 cases 419 bags, of which 20 cases 195 bags sold, partly prior to the public sale, as follows: medium, some bold roughly cut limed 54s, dull small and ends cut limed 29s, and bright medium and small washed rough, mixed with some dark and rather lean (72 bags new crop) 28s per cwt.

COCHIN GINGER in demand and firm, but business small. Sales of ordinary to good washed at 25s to 27s, and ordinary brown rough at 25s to 25s 6d.

CARDAMOMS.

On India, 10 cwt. Ceylon Seed February-April sold at 2s 6d c.i.f. London.

INDIA RUBBER.

Constant advices of short receipts at Pará and higher prices there, with very active American buying, have caused an advance of about 2d to 3d per lb., with very large transactions advised.

To-day 35 tons Bolivian sold, fine at 4s 3d, entrefine at 4s 2d. 25 tons hard fine spot and forward at 4s 3d 12 tons scrappy negrohead at 3s 7½d, and ½d to 1d more now asked. Peruvian Ball sold at 3s 6d. Cametas at 3s 1d.

At auctions to-day—

Pará.—10 cases sold, fine rejections part gutty 3s 11d to 4s 0½d, selected virgin part coarse 3s 8d to 3s 9¾d.

Peruvian.—24 cases sold, middling scrappy negrohead 3s 6½d. fair ball 3s 5½d.

Mangabeira scarce and wanted, 2 bales fine Rio sheet sold at 2s 6¾d.

Columbian sells readily at very high prices, fine sheet 3s 7½d good sheet and scrap 3s 7d, fair 3s 5d to 3s 6¼d.

Central American, &c., in good demand. 377 packages offered and 250 sold, fair scrap 3s 5d to 3s 5¾d, rather mixed ditto 3s 3d to 3s 4d, soft virgin scrap 3s to 3s 2¼d, fair to good pressed strips clean 2s 5d to 2s 6d, dirty foul strip and sheet 2s to 2s 2d.

Madagascar.—127 packages offered and 87 sold, 9 bags fine clean East Coast Niggers at 2s 10¾d; Majunga, good scrappy 2s 7½d to 2s 8½d, rather mixed ditto 2s 4d, foul ditto 2s to 2s 2d, fair to good black 2s 3d to 2s 5¾d.

Mozambique scarce and high; 98 bags offered and 39 sold, ordinary to good Lamu ball 3s 0¾d to 3s 3d, middling white ball 2s 9d, fair pickings 2s, clean brown Niggers 2s 9d to 2s 9½d.

Congo.—17 bales good strip sold at 3s 4d.

Penang.—133 cases retired at high prices; some fine red sold at 3s 1½d, middling Rangoon at 3s 2d.

Borneo.—90 cases offered and 22 sold, fair lsts a little barky at 2s 2¾d per lb.

Balata.—60 packages offered and 51 sold; Venezuelan block, good at 1s 2½d, pickings 11½d to 1s 0½d.

CINCHONA BARK

THE MONTHLY SALES.

Offerings at auction on Tuesday presented the very moderate supply of 1,909 packages, for which there was a fairly good demand at steady prices, the average unit being nearly 1d, the greater part of the catalogues found buyers at or immediately after the auctions

119 bales *South American* sold. Bolivian cultivated Calisaya quill 5¼d to 6½d, flat 6½d, and Red 4½d per lb.

253 bales, &c. *Ceylon Cinchona* were brought forward, and 200 bales sold as follows:—Succirubra, chips and shavings 2⅝d to 3½d; Ledgeriana, chips renewed 4½d per lb.

Of 1,015 bales *East India Cinchona* offered, 800 bales sold as under:—Officinalis, chips and shavings 2¾d to 3½d, ditto renewed 2¼d to 4⅝d; Red, chips 2⅜d, chips and shavings renewed 2¼d to 2⅞d, broken quill 3¾d, branch 1½d, root 2⅜d; Ledgeriana, chips 2½d to 4⅝d; Hybrid, chips 3d per lb.

273 bales and bags *Java Cinchona* catalogued and 200 bales, &c., sold; Ledgeriana, chips 3⅛d to 4⅛d, branch 2½d to 4⅛d, and root 3¾d to 4⅛d per lb.

Of 267 bales *African Cinchona* brought forward 225 bales sold:—Succirubra, quill 3⅝d to 4¾d, broken and chips 3½d to 3⅝d per lb.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 3rd Proximo. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Please note the change of address.

Coorg.

Polli Betta, 22*nd Feb. Weather.*—Some clouds have been showing up since last report. There has hardly been any wind. On the whole it has been fine. *Crops.*—The rain reported as having fallen on the 7th and 8th has brought out a sprinkling of blossom, which appears all right so far. Where rain was heavy the display of blossom has been very fair. Bees in plenty were on the blossom. *Labour.*—Sufficient. *Health.*—Good.

THE TAMIL LABOURER.

It is greatly to be feared that Ramasawmy, the Tamil labourer, has been dipping into the Scriptures of the West, and has acquired that modicum of knowledge in which lurks danger. In fact, it is to be feared that he has read that a prophet is not without honour save in his own country, and has applied the remark to himself as seriously as if he were a prophet himself. At least, he has acquired some sort of a reputation on estates abroad, while nearer home it is difficult to get him to do estate work at all. In the Straits Settlements and Borneo he has actually acquired a name, and, perhaps, also a reputation, that is not his. He is known there as a "Kling," though the genuine Kling is obviously a Telinga or Telugu man, not a Tamil. He is described by a Borneo contemporary as of inferior physique to the Chinaman, or Malay, though at his best he is not so. He is said to be "less strong in constitution, and apt to consider himself very ill on the flimsiest pretexts." Indeed, it is said that it takes 3 Tamil coolies to do the work of 2 Chinese; and it is perhaps true, though not stated, that 3 Tamil

coolies absorb drugs—including castor oil!—enough for 6 Chinamen. Nevertheless, the Kling is a favourite in many quarters, and if he is not an intense worker, he is a useful one nevertheless. As our Borneo contemporary points out, in the Straits Settlements Klings are the principal cultivators of Sugar, Coffee and Tapioca. In Ceylon they are employed as road-makers, house-builders, and on Tea, Coffee, Cinchona, and Cinnamon plantations, &c., &c. They are very amenable to reasonable discipline, and are ten times as quick-witted as the plodding Chinaman or lazy Malay. If they are not engaged at very great distances from their native country, they take their families with them; and "colonies" of Tamils have been established in countries much farther away than the Straits Settlements or Borneo. The work of the women on the estate is a factor of some importance to the planter.

What has led us to make our present remarks is the recent conjunction of two facts, which may almost be said to constitute the obverse and reverse of the Tamil labourer's medal of honour. Only a little time ago we observed that a Borneo paper, while not an enthusiast on behalf of the Tamil labourer, had come to regard him as a *pis aller*. It even ventured to suggest that a small experimental gang might pay, in view of the enormous rates of advances paid to Chinese and other coolies; and once the door were opened the influx would be large. It was thought that competition would be good for JOHN CHINAMAN, who is at any rate grasping in regard to coins of the realm. The suggestion was thrown out that, once JOHN CHINAMAN found that his Kling rival would underbid him, he would return to his duty, at reasonable rates of wages. Yet, on the other hand, a complaint lately reached us from the Pulneys—in the very heart of the Tamil country—that a certain estate had been virtually abandoned, mainly because of the difficulty of obtaining the necessary labour supplies. Naturally, the thought that the Tamil was wanted near home, and could not be got, suggested the idea that when wanted afar off he would not be obtained very easily. But facts in Ceylon were opposed to this idea, and as regards Borneo it was distinctly stated that there was no difficulty. The *North Borneo Herald* noted last month:—"We are glad to learn that one small estate is already meditating the importation of a few Klings by way of seeing whether it will pay. All the necessary machinery is ready. There is an Indian Immigration Agent in Sandakan who has only to write to the proper officials in India to secure as many coolies, from half a dozen to several hundreds, as he may desire; and these at rates which involve, scarce a fourth of the expense (apart from passage money) involved in importing Chinese." As a matter of fact, the experiment was tried sometime ago, and Borneo, like Ceylon, succeeded in attracting the Tamil labourer. Was it a difference of wages, of treatment, of climate; or was it merely that the Tamulian was glad to avoid the evils he knew of to learn something about those previously unknown? It was this question that seemed to us to demand consideration, and it is on this point that we should like to have some information from our readers.

We regret to say that our offer of a prize of Rs.100 for the best essay on the Labour Supply of the various planting districts of Southern India has attracted but little competition, and that there is not a single essay that deals with the Labour Supply in the Pulneys or in Travancore. The Tamulian "at home," therefore, is not referred to in the competitive essays, and we should turn to them in vain for information as to why there is no scarcity of Tamil labour in Ceylon, and yet a scarcity on the Pulneys. If it is a question of climate,—the parts of the Pulneys to which we are now specially alluding being doubtless cold at times—there is some explanation. But is this all? We by no means grudge the Straits planter or the Ceylon planter his South Indian labourer, but we certainly think that the planter in these parts should protect his own interests to the extent of seeing that there is a sufficiency of "indigenous" labour retained "for local consumption." No doubt, the wages offered abroad are higher; but there are certain disadvantages to be set off against this. The matter seems to be one that deserves some little consideration, and we should be very pleased if any of our readers who are qualified to offer an explanation would kindly do so. Probably some of our readers' estimate of the merits of the Tamil labourer is not a very high one; but if that be the case he can hardly be at his best when working on a South Indian estate, for there is no doubt he is capable of doing excellent and steady work. The difficulty is to induce him to give of his best; and here much must depend upon the tact of the employer or the Superintendent.

COCAINE IN PERU.

There are 10 cocaine factories in Peru; 5 in Huanuco; 1 in the Monzon district; 1 in the Puzuzo district; 2 in Lima; and 1 in Callao. Two or three years ago the production of this valuable alkaloid was said to have decreased. This decrease is accounted for by the fact that the extraction of the alkaloid is cheaper abroad, as is proved by the increase of the exports of coca leaves. The following table shows the quantity and values of cocaine exported from 1891 to 1895:—

Year.	Quantity.	Soles.
	Kilos.	
1890	1,730	346,000
1891	3,215	643 000
1892	4,550	910,000
1893	2,357	471,800
1894	4,716	943,200
1895	3,407	600,940

The quantity and value of coca leaves exported from 1891 to 1894 were the following:—

Year.	Quantity.	Value.
	Kilos.	£.
1891	128,543	241,473
1892	388,465	574,396
1893	390,955	707.792
1894	372,360	706,586

However, it is argued by a Peruvian economist that it is a matter of doubt, whether, from a national point of view, the promotion of existing industries and the creation of new ones should be encouraged. The increased want of labour for the

fields and mining is regarded with considerable anxiety by agriculturists and miners, who maintain that the undivided energies of the country should be devoted to the development of her natural resources. This view would seem to be a very sound one. Peru not being sufficiently populated for the cultivation of the immense tracts of fertile land on the coast and on the plateau, it may be asked what can be the use of opening fresh regions unless emigrants can be conveyed there. It has been suggested that the best labourers would probably be Indian coolies. If a proper scheme for their protection could be devised, the greatest advantage would be derived from their introduction into Peru. But it is equally possible that coca might be worthy of the attention of planters in India, and that cocaine factories might prosper as well here as in Peru. "Peruvian" bark has practically left its native home and formed colonies in Java and India. Were enterprise rightly directed, coca might follow this excellent example.

CEARA RUBBER.

A few months ago, Mr. D. Hooper, F.I.C., F.C.S., F.L.S., Officiating Reporter on Economic Products to the Government of India, reported on a sample of a few pounds of ground bark from the Ceará rubber tree received from Mr. Proudlock, Curator of the Botanic Gardens, Ootacamund, in October 1898. Mr. Hooper stated that the facility with which the tree grows in certain localities in South India where the tree has been experimentally planted, encouraged the hope that the juice would be secreted in large quantities, and the raw rubber made available for the home market. These expectations were not realised, since it was found that several well established trees refused to "bleed" when the bark was cut during the dry weather, and the small quantity afforded by other trees growing in more favoured situations was not sufficient to pay for the expenses attending their cultivation. It was next thought probable that the rubber might be extracted by some simple process from the stem bark of the mature trees. An experiment was made in this direction in 1886, when Mr. L. Wray, Junr., of Perak, forwarded to London a sample of bark of *Payena Leerii (Gutta Sundeh)* for valuation and report. The bark was duly analysed and found to contain over 13 per cent. of gutta and resin. The recovery of the rubber by means of solvents involves such a loss that it was considered at the time that the material was useless and the process of separating the rubber was too expensive. The bark in question was boiled for two hours with benzol, the solution filtered, and the solvent recovered by distillation. The residue was treated with spirit to dissolve adherent resins, and the caoutchouc weighed. The amount was equal to half of one per cent. of caoutchouc on the air-dried bark. Another estimation was made with boiling chloroform in the ordinary way, and the total dry resinous extract obtained by means of this solvent was less than one per cent. The cultivated Ceará rubber bark contains such a minute proportion of rubber that it would be useless to endeavour to extract it by artificial means. The bark operated upon contained 12 per cent. of water and a large quantity (17·5 per cent.) of mineral matter. A trace of tannin, a little red colouring matter and some starch were the only other noticeable constituents in the material.

Since then Mr. Hooper has made a microscopical examination of the inner bark, with the result that while the laticiferous vessels or caoutchouc ducts are not absent, they are scantily distributed in the bark and are undeveloped and in some cases empty and he concludes that while the cultivation of the Ceará rubber trees has been fully established in Southern India, it is a matter for regret that the climatic conditions or soil are not suitable for encouraging the secretion of rubber in the trees to make their introduction a commercial success. In fact, he says that the result of the experiment shows that any attempt to extract rubber from the bark of the tree grown in India must end in hopeless failure.

To us this appears a very wide conclusion from an experiment made with a few pounds of bark, apparently taken from trees grown in one place or under similar conditions. Before finally dismissing the Ceará rubber tree from their thoughts, planters should, we think, study the matter for themselves, with a view to seeing whether conditions cannot be found or introduced in India that would induce this tree to secrete rubber more freely than it did in the instance under reference. If any of our readers can already give the result of such experiments, we shall be very glad to hear from them.

MALARIA.

No doubt there are various types of Malaria, and various causes and conditions that produce it. Some few of these will have a tendency to produce it in any country where it is prevalent; others may be peculiar local circumstances, that have a narrower bearing. Any particulars of the former should be of interest to those of our readers who reside in malarial districts or tracts, and it is possible that some remarks by Dr. A. Dunley-Owen on Malaria in Rhodesia may not be without instruction for readers in Southern India. Dr. Dunley-Owen refers to certain causes as arising from the land itself or endemic causes, such as: "low-lying country, porous soil, alternate spells of heavy rainfall and intense dry heat causing rapid growth of rank vegetation, which is quickly dried up and withered by the sun, and the heavy rains following convert the whole into a mass of decaying matter, most pernicious to those living near." He observes also that the overturning of fresh virgin soil, necessary in farming, appears to produce a severe form of malarial fever. The malaria poison also seems to be most virulent an hour before and an hour after sunrise, and he has made cultivations of the malarial bacillus obtained at this time of the day from the grass and soil, but only to the height of 4 feet from the level of the soil—a curious fact, and one with regard to which he would like to know whether it has been substantiated by the observations of others. The conditions which he considers facilitate a tendency to malarial fever and which may be classed as 'ethnological causes,' are: excessive spirit drinking (there is a recognised form of malarial fever termed 'whisky fever,') poor quality of food (fresh meat and vegetables being quite unprocurable in parts) tinned meats, jams, vegetables—in fact, everything is tinned, and becomes in time quite nauseous. Then again, fever is far more frequent amongst men than among women, and more single men are victims than married ones. This he puts down to the fact that women are not exposed to 'roughing it' like men, and that married men have home comforts which are impossible for the single; also that men are more liable to whisky fever. As regards treatment, this authority says that though every

treatise on medicine and also the so-called popular handbooks describe quinine as a 'sheet anchor' in malarial fever, experience tells him there is no greater mistake. Indeed he thinks that quinine is often taken in snch large doses as to produce "an utter rottenness of the constitution," and "when one of these individuals falls a victim to fever he generally has it badly." Dr. Dunley-Owen has found the most successful treatment to be absolute rest in bed, a 15 gr. dose of antipyrin to begin with, followed in an hour by the following mixture: 10 minims of tincture of perchloride of iron, 5 minims of hydrochloric solution of arsenic, with water to 1 oz. 1 oz. to be taken every four hours with a 5 gr. tabloid of sulphate of quinine. At bed time he generally gives about 5 gr. of calomel, followed in the morning by a dose of some effervescent saline. In most ordinary cases of fever this treatment cuts short an attack under twenty-four hours, and then he follows up with a tonic course of Easton's syrup in 1 dr. doses with 1 oz. of water three times a day at meals, for a month, and he finds that most individuals, will thus enjoy an immunity from malarial fever for some months at least although living in an unhealthy district. He adds with regard to food:—"Stimulants are required, especially champagne. This will often stop the obstinate vomiting when even a mustard poultice at the pit of the stomach fails. During an attack I order milk and hot water in equal parts, and in some cases with milk a tablespoonful of brandy to each pint. When the temperature is normal and the paroxysm over I give any food the patient fancies, and I find this answers well. I have one patient who after an attack of fever eats ravenously of cheese, enjoys it, and, what is more to the point, digests it."

THE PLANTERS' ASSOCIATION OF CEYLON.

The annual meeting of this Association was opened at Kandy on the 17th instant. Some of the proceedings may be described as "excited," a good deal of warm feeling having been aroused recently by some remarks of Mr. Harcourt Skrine. It would occupy space to explain the details of this affair, and would besides reopen a matter that can only be regarded as a regrettable one. All we need say is that, at the meeting, Mr. Skrine appears to have eaten his own words in a most accommodating manner, apologising here and expressing regret there, until the meeting at last "agreed to accept his apology," some portion of which has to be communicated to the Secretary of State and the London Association, to counteract the statements originally made by Mr. Skrine. The Annual Report, so far as it is of interest in India, may be summarised as follows:—

TEA.

The past season has not been a favourable one. The tea industry has had to contend during the past season with less rainfall, even in the usually wet districts. Prices, both in the Local and London Markets, have shown, fortunately, only a slight decrease, whilst exchange has also ruled higher. Your Committee cannot fail to note with satisfaction the all round increased exports both from Colombo and from London to Colonial and Foreign Markets. The tea producing industry has been passing through a severe crisis. The worst of the depression appears now to be over, and there are decided indications of a brighter outlook.

COCOA.

The Estimate for the year was cwt. 35,000. The amount actually shipped was cwt. 38,099. The crop for 1899 is likely to be the largest yet picked, and will probably be about cwt. 40,000. During the past year, "Cocoa Disease," which has attracted a great deal of attention, was carefully investigated by Mr. Carruthers.

COCOANUTS, CARDAMOMS, &C.

The season for cocoanuts was reported to have been a favourable one everywhere, but particularly in the Southern and Western parts of the island; cardamom cultivation had been extended very considerably throughout the Central and Uva Provinces; but at present prices were on the decline; and a considerable acreage had been planted with rubber in the low-country amongst the tea.

OFFICIAL ESTIMATE OF THE TEA CROP FOR 1899.

The Committee estimates the tea crop for Ceylon for 1899 at 126,500,000 lbs.

GOVERNMENT ENTOMOLOGIST.

The appointment of a Government Entomologist is a matter worthy of special record, as being undoubtedly, in a country of tropical luxuriance, a step in the right direction. It is earnestly to be hoped that the policy thus inaugurated will now be persistently followed up, and that the necessity for keeping in touch with practical Agriculturists will not be forgotten, and, that by constant reports and investigations into Insect Pests, real progress will be made in combating successfully the numerous enemies to which all products are more or less exposed.

COCOA DISEASE AND THE SERVICES OF A CRYPTOGAMIST.

The services of Mr. J. B. Carruthers, F. L. S., Cryptogamist, were available for the study and investigation of Cocoa Disease until the 25th December, 1898. Your Committee refers members to Mr. Carruthers' Reports. It having been found that the figures mentioned in the second report could not be satisfactorily reproduced locally, it has been decided to have this work done in England under Mr. Carruthers' own supervision, so that they can be included with the reports when published in the Book of Proceedings of your Association.

ANALYSES OF COCOA TREE AND MANURE.

The result of the analysis of the Cocoa tree, and the position proposed Ordinance for the analysis of manure were touched upon, and the questions of the theft of Prædial Products and the issue of warrants for the arrest of absconding coolies were also alluded to.

CEYLON ASSOCIATION IN LONDON.—IMPORTANT COMMENTS.

Your Committee has to report that a somewhat new departure on the part of the London Association appears to have been inaugurated in reference to the relationship of the two bodies, which may require consideration later. The circular issued by the Committee of the Ceylon Association in London during June, 1888, stated that "This Association having its origin in the proposal of the Planters' Association of Ceylon to establish a branch in London, is formed for the purpose of acting in correspondence with the public bodies in Ceylon, for the protection and furtherance of the general interests of that colony." That position had been so far mutually safe-guarded, but has been altered by the fact of a member of your Association while on a visit to England bringing forward a distinct proposition for discussion at Home that on his own motion had been defeated by a large majority at a general meeting of the Planters' Association, thus seeking, by the votes of members of the Ceylon Association in London to reverse or militate against Resolutions duly passed here. The statements made by Mr. Rutherford and Lord Stanmore and Mr. J. Whittall, showing the dependence of the London body upon the Ceylon Planters' Association were next quoted; and some of the remarks of Lord Stanmore and others at the Banquet in honor of the then new Governor of Ceylon at the Imperial Institute on the 15th January, 1896, and eulogistic of His Excellency were also given. The report then continues "With such strong expressions of confidence and words full of encouragement and support in a "forward policy" on the part of His Excellency the Governor, the attitude now assumed so suddenly, and without any official communication beyond a bare brief cablegram, received in December through the Chamber of Commerce, appears to be difficult of explanation, whatever view may be taken on the particular question, regarding which *ex mero motu* a deputation from the Ceylon Association in London was appointed to wait on the Secretary of State."

VARIOUS SUBJECTS.

Among the other subjects dealt with in the concluding pages of the report are those of Exchange and Currency; Reduction of the British Tea Duty; Imperial Penny Postage; Post and Telegraph matters; the number of patients at the Planters' Ward at the General Hospital, Colombo, and at the Baker Ward, Nuwara Eliya; Nomination of visitors to Hospitals and Dispensaries in the Planting Districts; the Ceylon Tea Kiosk; the Victoria Commemoration Buildings' Scheme (in connection with which it was reported that,

owing to the foundation costing R15,000—about three times the amount estimated—an appeal was made to the Ceylon Association in London to co-operate in raising the sum of £1,000 with disappointing result. For the current year the Committee recommended that R1,000 be appropriated from the Association funds towards liquidating the special "Foundation Construction Account." It was expected that the structure would be built before the end of the year). The advantages of the Planters' Benevolent Fund were pointed out, and the District Aasociations were thanked for their ready aid and attention to all matters affecting the Planting community.

REPORT OF THE "THIRTY COMMITTEE."

An exhaustive report was also to be submitted by the "Thirty Committee," from which the following excerpts only need be taken here:—

FINANCES.

The total collections paid into the Ceylon Tea (New Markets) Fund on account of the export duty on Tea, from January to 31st December, 1897, amount to R249,074·86 The Balance in the bank, brought forward from 1897, was R128,282·56.

CEYLON TEA IN AMERICA

The total amount of money as shown by the accounts in Ceylon appropriated by Mr. Wm Mackenzie, Representative in America, since the commencement of his operations in 1894, aggregated as at 31st December, 1898, R662,166 51.

In the course of notes received from Mr. Mackenzie, reporting on the past year's work in the United States and Canada, he says:—"A great blow was struck at the tea industry in the States by the war tax of 5d. per lb. put on at a time when coffee was unprecedentedly cheap Many of our friends were disgusted, and lost heart Several of those who did not believe a duty would be imposed on tea, unless coffee were taxed in proportion, sold forward, and have had themselves to bear the burden of the tax on large quantities of Japan teas. This has caused a very heavy loss, and necessitated a reduction in the tea departments of several houses. Figures, subject however to correction, show that duty was paid on only 12,000,000 lbs. of tea between 1st June and 30th November, 1898, or that the *clearances*, which formerly averaged 93,000,000 lbs. per annum, say 46,000,000 in six months, fell to 12 millions for the half-year. It was hardly an exaggeration to characterize the industry as practically killed by the tax and the low price of coffee.

"Under the circumstances, it is surely gratifying to find that our teas have been taken in increasing quantities. For this year, I should hope 'Ceylons' will exceed 8,000,000 lbs. Of course, all this does not prove that only 12,000,000 lbs were consumed during the six months. Something must be allowed for consumption of stocks on hand."

CEYLON TEA IN RUSSIA.

With respect to Ceylon tea in Russia, Mr. Thomas Christie recommended that the "Thirty Committee" should endeavour, among other things, to get the Russian import duty reduced as the greatest aid to increased consumption; and the "Thirty Committee" reported that steps were at once taken in the matter, which, while unsatisfactory in the result as communicated recently through the local Government, by no means closed the door to further representations, and rather appeared to point to favourable attention and consideration of arguments used with the object of improving the position of the trade with Russia.

CEYLON TEA IN OTHER COUNTRIES, &c.

The report of the Committee deals with the position of Ceylon teas in other European countries, South Africa, &c.

TEA ESTIMATE.

The Tea Estimate is 126½ millions of which 93 millions are for the United Kingdom.

NOTES.

Prize Essays. Only five competitors have entered the lists for our Rs.100 prize. We hope to announce the result at an early date.

Calcutta Tea Sales. At the sales on 17th instant, 4,959 packages were sold, the rest withdrawn. The market was firm at fully previous rates.

Coffee Prospects. Discussing these in Brazil, the *Rio News* of Jan. 3rd says:—The coffee crop will be large and prices will continue low, though some improvement may, perhaps, be expected later on.

Porto Rico Coffee. Reports on the Porto Rico Coffee crop, which has been gathered in, refer to the enormous proportion of "light coffee," which has caused the total to fall a good deal short of estimates.

Tea in the United States. A Philadelphia firm is advertising special "lines" of Tea as follows:—Amoys 21½ cents, per lb., Congous 23½ cents Ceylon 25 cents and 26 cents, and Foochows 24½ cents. Say, 10¾*d.* to 13*d.*

Ourselves. Replies to our inquiry as to what particular matters subscribers would like the paper to deal with are coming in more freely than we had expected, but by no means as freely as we should wish. The "state of the poll" will be declared later.

An opening for Indian Tea. Mr. J. H. Skrine, C. S., writes to the *Englishman*, that as a market for Indian and Ceylon teas, Central Asia has to be reconquered. For instance, Bokhara, where only green teas are consumed, and which was formerly a central market for Indian-grown green teas, now imports them only to the extent of £25,000 worth a year.

The London Tea Market. Messrs. Gow, Wilson and Stanton's cable of 16th inst. to Colombo, is of a cheering character. "The market generally shows a fractional advance." Ceylon Pekoe Souchong is quoted 6¾*d.* (¼*d.* up) and the average for the week was 8½*d.* (⅜*d.* up) of 15,000 packages offered 14,000 were sold. Of Indian Tea 41,000 packages were sold out of 42,000 offered, the average being 9¼*d.*

No Free Breakfast Table. Reminded lately by certain Trades Councils of a promise he was believed to have made to repeal the duties on tea, coffee, &c., Sir Michael Hicks-beach wrote to Leicester affirming that he had never made any such promise, and that indeed anything he had said on the subject had been in the opposite sense. Nevertheless, the feeling is strong in many quarters that the Free Breakfast Table must come in time.

Extensions. The *I. P. G.* notes that the New Dooars Tea Company is opening out 100 acres of new land this year in order to bring the garden up to 500 acres, the area mentioned in its prospectus. This extension will be planted out with first-class indigenous *jât*, the same as the 400 acres already planted out. Ample nurseries already exist for this purpose, as well as for future filling in of vacancies. A crop of one maund of tea per acre off the 135 acres of 1897 plant is estimated for this season.

Eadella Estates Company, Ceylon.

At a special meeting of the Eadella Estates Company held at Kandy on the 18th instant, it was decided on the recommendation of the directors to accept the offer of Messrs. Lipton, Ltd., for the sale of the Estates of the Company. The price is stated to be £4,900 sterling. The properties which belong to the Eadella Estates Co., Ltd., are :—Eadella 300 acres (153 tea, 25 cacao, 25 Liberian coffee) and Lesmoir 272 acres (90 tea, 10 cacao, 10 Liberian coffee).

Imports of Honey into the U. K.

Apropos of our recent remarks on bee-keeping, we note that it is estimated that every year the United Kingdom has to import 2,250,000 lbs. of honey, of which the declared value is 31,000*l.*, or about 3¼*d.* per lb. Amongst the countries engaged in supplying the markets with this product the principal are the United States, Chili, and Peru, the other contributors including the British West Indies, France, Australasia, Canada, Germany, Italy, and the Spanish West Indies. No statistics of the quantity of honey produced in the United Kingdom are obtainable.

The Udapussellawa P. A., Ceylon.

The annual report of this Association states that the acreage of *Tea* in bearing is 7,985 acres, estimated to yield in 1899 3,169,000 lbs., which is equal to 396 lbs. per acre, against 421 lbs. per acre in 1898. The area in bearing will be considerably increased during the next two or three years. *Coffee* is now almost a thing of the past. The existing patches have been all planted with tea, and when the present crop is picked, which is a good one, most of the bushes will be cut out. *Cardamoms* are being planted at the lower end of the district under grevilleas as a trial.

Salvation in Tea !

The following is a cutting from a recent issue of the *Methodist Recorder* :—"We are anxious to obtain a situation for a man whose case is very peculiar. It may be some time before we secure exactly what we want. Meantime, friends will be helping us to save a soul from death if they will give heed to the following notice. Their letters, we may add, we shall ourselves open :—Please order 1 lb. tea, or more, at 1*s.* 4*d.*, 1*s.* 6*d.*, or 2*s.* per lb., at once. All town orders, payment on delivery.—Owen, Box 246, *Recorder* Office, 161, Fleet-street, London, E.C." "Souls saved by our new 1*s.* 4*d.* Tea" would make a startling headline for a placard !

They don't agree !

We notice, says the *Indian Planters' Gazette*, that our Southern India planting contemporary is taking a sort of ballot as to what should go into its columns, and in what order of precedence. Its readers and supporters will, no doubt, appreciate this delicate compliment to their judgment and taste in being thus taken into the confidence of the Editorial High Priest ; but we doubt whether our brother of Madras will succeed in obtaining anything like a consensus of opinion among its *clientèle*. Planters as a body would seem to have "agreed to disagree" about most things, as witness the columns of all our planting journals. However, we shall look forward with some interest to the result of this *plébiscite*.

Ceylon Tea Estimates.

The Tea Crop Estimate for 1899 —is now put by the Planters' Association at 126½ million lb. ; but of this, only 93 million lb. are counted for the United Kingdom or 3 millions less than was shipped thence in 1898, leaving 33½ millions for the rest of Europe, North America and Colonies ; but of this, 1½ is put down for local consumption, and if Russia takes 10 million lb., Australasia 16 millions and North America 4 millions, there will only be half a million lb. left for all other countries, against about 2¼ million lb. taken last year ! This, of course, will not do, says the *Ceylon Observer ;* but it remains to be seen if Russia increases its orders for Ceylon by some fourfold those given in 1898.—We count the tea entered last year for "China" as really intended for the Pacific coast of America.

Egg Preservation.

General Griffiths, of Rugby, has communicated to *Poultry* his successful experience in preserving a large number of eggs for several months in a solution of silicate of sodium, sold as "Wasserglass" by chemists. He used one part of the silicate to ten parts of water, immersing the eggs in it in glazed earthenware jars : but this year he intends to use only eight parts of silicate. Out of 529 eggs only six were found bad, and they were probably not quite fresh when put into the solution, as they were found floating on the surface. The rest were quite good, and some of them were kept nearly five months. As the silicate does not impart any flavour to eggs, they are much superior to some preserved in lime-water. The silicate of sodium is sold in the crude and refined form. The former was used, and it costs 4½d. to 6d. per pound.

"Unitas Salus Nostra."

The "peroration" of the Annual Report of the Planters' Association of Ceylon touches the right key-note. It is as follows :—"During the year marked activity has prevailed in mutual co-operation and unanimity in supporting the operations of your Association, the beneficial results of which must ere long become apparent. Your Committee conceives, therefore, that in reporting thus at the close of the Association's year, no better conclusion can be placed on record as a reminder than the following words of His Excellency the Governor some time ago :—'It is most essential that the Central Planter's Association should command respect. It is essential to the prosperity of your Industry. It is essential that you should have a strong representative Central body, and this can only be done by individual Planters sacrificing some small degree of independence of action, and delegating it to the Central body authorized to speak in your name.'" A pause here, and then the motto "*Unitas Salus Nostra.*"

A new Source of Manure.

The *I. P. G.* states that in addition to the preparation of isinglass, shagrin and fish oil, the Bengal Fisheries Company contemplates the manufacture of manure from fish offal and refuse. Our contemporary remarks :—"Hereafter, as prejudice against the use of night-soil is overcome in Bengal, as it has been in the vicinity of certain towns in the Punjab, the sewage of Calcutta may be expected to play as important a part in the promotion of agri-horticulture as that of European cities has done for many years past. We undoubtedly have at command the raw material for imparting the primal qualities to the tea plant, as also the virgin colouring matter to our indigo and other dye stuffs, and it would pay, and pay well, any company to fit such for public use. Were the manure that the Fishery Company can place at our disposal priced

low enough for the native raisers of dry crops, the items of such referred to above from Bengal would compete on favourable terms with any now placed on the European markets."

Destruction of Tea by Fire.

A telegram, dated 16th inst., reports that Henty's Warehouse in Melbourne has been destroyed by fire, and that the loss includes something like 500,000 lbs. of Tea. One man's loss is another's gain! A fire of such magnitude ought to do something to steady prices. The *Times of Ceylon* observes, however:—We learn that information has been received in Colombo that the tea destroyed in the fire at Henty's Bonded Warehouse was 3,000 chests or 250,000 lbs. (not half a million pounds as originally wired) of common Indian Souchongs and Pekoe Souchongs, and that, as the Indian tea season has just finished, orders were at once wired to Colombo to supply the deficiency. With the destruction of 210,000 lbs. consumed by fire at Connell's Warehouse in Sydney at Xmas, this will account for 360,000 lbs. of the one and a quarter millions excess of imports of tea into Australia last year, and which have brought about the fall in prices in the colonies. The high prices obtaining in the Colombo market have also led to a falling-off in the shipments of Ceylon teas, and a proportionate demand for cheap Indians and Chinas. The latter have slipped in to the tune of a couple of extra millions, but this is what we must expect when the European demand has forced prices up here while they remain down in other markets.

The Sleep of Plants.

This is so conspicuous a phenomenon that it excited discussion and speculation as early as the time of Pliny, and many explanations were given, which science has since disproved. The drooping of the leaves was attributed by some botanists to an aversion to moisture, a theory which had to be abandoned when such movements were made on cloudy days and dewless nights. The clover tribe, which always close their leaves at night, revel in rain, and nasturtiums will go through a day of tempestuous weather without showing any inclination to change their position. Linnæus was the first to give the subject special study and scientific research. While watching the progress of some plants of lotus, he began that series of observations on which his great work, "Sleep of Plants," is based. He found that nocturnal changes are determined by temperature and the daily alternations of light and darkness. Movement is not actually caused by darkness, but by the difference in the amount of light the plant receives during the night and day. Many plants, notably the nasturtium, unless brilliantly illumined in the day, will not sleep at night. If two plants, says the "*Rural World*," were brought into the centre of a room, one from the open air and the other from a dark corner, the neutral light which would cause the former to droop its leaves would act as a stimulant on the latter.

Tea Statistics for the Ladies.

In an interesting article, with diagrams, in the *Lady's Realm*, Mr. Harold Macfarlane sets forth some details of the tea consumed in the United Kingdom. He tells us that we consume eleven times the quantity that suffices for the average Russian, and four times the allowance of each inhabitant of the United States. Some of his statistics are interesting, observes the *I. P. G.* If the total quantity of tea consumed in Great Britain every twelve months was to be placed on one scale, and the whole British Army (on the peace footing) of 215,060 men was placed on the other, it would not counterbalance the tea chest. No! not even if each man on the average weighed 168 lbs. If five more armies of a similar number of men and weight were also thrown into the scale, they would have no effect on the equilibrium of the tea chest; nor would the beam swing before 65,640 additional men, weighing twelve stone each, joined the six armies already standing more or less at ease on the opposite scale. By that time they would number 1,356,000 men, and the indicator would show that the balance was true. We are further informed that in 1868 of every hundred pounds of tea sold in the United Kingdom, ninety-three pounds came from China, and only seven from India; whereas in 1898 eleven pounds of tea came from China, thirty-five pounds from Ceylon, and fifty-four pounds from India.

The Currency question.

In its annual report, 1898, the Planters' Association of Ceylon remarks:—"This most important and urgent question to all Producers was considered at the last Annual General Meeting of the Association at the instance of the United Planters' Association of Southern India, who by letter represented their views and invited support with a view to united action. The following Resolution was passed thereon, and immediate steps taken thereunder:—"That this Association, recognising the extreme gravity of the existing conditions of Exchange, resolves (1) 'To join the United Planters' Association of Southern India in representing to the authorities how disastrous to the interests of the Producer, European and Native, the artificial high rate of Exchange has been; (2) to impress upon the Ceylon Association in London how essential it is that they should at once take steps to see that the Producers' interests are not thoughtlessly sacrificed in such a vital matter.'" On the 20th April, 1898, the Memorial of the Planters' Association to the Secretary of State for the Colonies was forwarded through His Excellency the Governor. The document represented to Her Majesty's Government how disastrous the artificial high rate of Exchange had proved to the Producers of the staple product of Ceylon (Tea)—European and Native—and urged the necessity for early action in this vital matter. The appointment of Lord George Hamilton's Currency Committee still sitting in London, and the non-inclusion of a Ceylon Representative—though specially pressed for—are still fresh in the memory of members; while what may prove to be the ultimate result of the present deliberations, it is, of course, impossible to foretell, but your Committee recommends continued vigilance, so that no opportunity may be lost in giving prominence to the Producers' view of the situation.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50 lbs. Nitrogen.	14·92 lbs. Lime.
57·38 „ Potash.	13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs 6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

GENERAL ARTICLES.

A NEW INDUSTRY: ALOE FIBRE.

At length, a full and fair trial is to be given to the utilisation of aloe fibre in Ceylon, through a machine, the patent for which has been secured in South Africa and India as well as Ceylon. The patentee has granted certain privileges to a local Syndicate who, with some public spirit, have had a machine constructed at the Colombo Works and an adequate trial is to be made shortly at Matakuliya But first a due supply of the leaves of *Fourcroyn giyantea* (formerly known as *Agave fœtida*) must be obtained and Mr. Jenkins, of Cargills, Limited, is advertising for any one who will undertake to cut and supply "leaves of the large green prickly aloe" They ought to be found near to a railway station and for their carriage thence to Colombo, we should expect the Government with the cordial approval of the General Manager to give *free carriage*. This is a very small request to ask for an experiment which is costing money to the promoters, but which may prove of great moment to the Colony. Considering all the expenditure that Mr. Chamberlain has sanctioned in Fibre and other industries in the West Indies, the Ceylon Government may well do all in its power to aid the present local experiment, and perhaps to the length of supplying the leaves required for the first trial from the sides of their railway line. At any rate, free carriage may well be claimed.—To make the initial experiment, about 25 tons of aloe leaves are required, stripped of thorns and put up in bundles. These will probably be delivered in quantities of one or more tons at different railway stations —*Ceylon Observer.*

MALE COFFEE PLANTS.

The *South Sylhet* correspondent of the *I. P. G.* writes as follows:—"I noted Mr. G. R. Oliver's letter on male coffee plants, as also the extract from *Planting Opinion* in recent issues of the *I. P. G.* The subject is, as stated in the article, a most fascinating one, and will well repay study. It is rather extraordinary that any one living during the latter years of the last decade of the nineteenth century should have a lingering doubt of what was well known to the Arabians from time immemorial. The sexual system of Linnæus is founded on the soundest principles, and our own Dr. Roxburgh never found a single plant in India which did not corroborate this fact Space will not allow my going further into the subject now, but I will return to it in a future letter. However, I may say that the coffee plant is not *dioecious*: and the fact of the bush, to which Mr. Oliver alluded, having an abnormal number of peaberries on it, is no sign of it being a male plant If there ever will be such a thing as a male coffee bush,* it will have no seed. The very fact of a bush producing seed and, moreover, that seed germinating, is ample evidence of its not being an absolute male. It would be interesting to know if the seedlings of the coffee bush inherited the peculiarity of the parent plant by also giving peaberries. The cause of peaberry is not definitely known, although reasons have been surmised. A grade of coffee goes under the name of peaberry on the market, and brings a somewhat higher price than the ordinary, but I think that the name is only given to a grade which has a large proportion of peaberry. Perhaps some other of your correspondents can give a full explanation."

* In course of time there very likely will be.

THE CEYLON TEA ESTIMATES FOR 1899.

THE *Times of Ceylon* states that the estimate for the current year promises to be rather higher than the figures published by Messrs. Forbes and Walker, viz., 125,000,000 lbs., which, it hoped, would not be exceeded. It would appear that quite 128,500,000 lbs. are expected. This apparently is the case, although, owing to the bad effect of inflated estimates, planters were asked to be very careful over their returns. Last year, the first estimate was nearly 126,000,000 lbs.; but abnormal weather brought the actual yield to six and a half millions less. With the larger total for 1899, we are especially glad to know that the Planters' Association intend to telegraph to London the limited quantity which will be available for the United Kingdom. This will keep matters adjusted; and will show the packet-dealers that they have not unlimited supplies within their reach. The figures below are not all this year's estimates, as plainly indicated; but they will prove of interest until the final figures are available:—

District.	Cultivated acreage.	Acreage in bearing.	Estimated crop for 1899.	Average lbs. per acre.
Ambegamuwa ...	15,970	14,179	5,795,700	408
Badulla ...	16,737	11,147	4,516,090	405
Balangoda ...	5,181	2,935	1,189,000	405
Dickoya ...	28,459	27,317	12,053,250	440
Dimbula ...	--	43,387	19,854,000	408
Dolosbage and Yakdessa ...	16,665	14,842	5,939,500	400
*Haputale ...	14,355	10,154	4,000,000	394
Kalutara ...	15,410	13,014	6,527,550	501
Kelani Valley ...	32,564	24,817	13,044,000	526
†Kotmale ...		7,643	2,853,000	373
Maskeliya ...	19,095	18,175	7,341,000	403
Maturata ...	6551	5,047	1,832,000	354
Upper Hewahetta.	4,029	3,550	1,572,000	443
Lower Hewahetta.	6,464	5,291	2,030,700	306
Nuwara Eliya ...	6,482	5519	2,637,650	478
Northern Districts.	—	39,520	15,370,000	309
Passara ...	9,920	7,700	3,044,000	400
Pundaluoya ...	4,932	4,356	1,811,000	415
Pussellawa ...	—	22,230	8,990,000	404
Rakwana ...	5,332½	4,440½	1,603,000	361
*Uda Pussellawa.	—	7,374	3,090,000	420
*Udugama ...	1,816	1,456	557,000	382
Nilambe, & Native and Unestimated	—	—	3,000,000	—
			128,649,540	

* Last year's figures repeated. The Haputale return is delayed through unavoidable causes. Some of the estates in Uda Pussellawa refused information, and the Central Planters' Association Committee will have to make the 1899 estimate for them. The Udugama figures have not reached us. Haputale should show an appreciable increase.

† Kotmale was omitted in the detailed returns of the Planters' Association last year; and the figures above are those for 1897.

TEA STATISTICS.

Imports and Deliveries of Tea in London from 1st June, 1898 to 31st January 1899, compared with the previous season and Stocks on 31st January in each year.

IMPORTS.	1899.	1898.
China	25,740,302	29,019,972
Japan	59.215	72,930
Java	2,235,590	2,285,990
Indian	118,399,607	117.028,270
Ceylon	62,958,428	63,058,498
Natal	114,864	26,880
Grand Total ...	209,508,006	211,492,540

DELIVERIES.	1899.	1898.
China	20,021,479	22,297,259
Japan	62,075	50,765
Java	2,229,920	2,443,770
Indian	94,806,565	83,792,120
Ceylon	62,111,584	65,694,044
Natal	113,952	24,192
Grand Total ...	179,345,575	174,302,150

STOCKS, January 31st—	1899.	1898.
China	17.439,407	19.613,229
Japan	95,420	103,740
Java	663,250	594,440
Indian	61,666,830	65,471,362
Ceylon	17.840,138	17,317,634
Natal	33,312	33.936
*Grand Total ...lbs.	97,738,357	103,134.341

*Arrived to January 31, but not yet included in the stock——lb., against 500,000lb. in 1898.

COFFEE MOVEMENT IN AMERICA IN 1898.

The year 1898 is one of exceptional interest so far as coffee is concerned, the record showing that the production of coffee, stimulated by years of high prices, has far outstripped the consumptive requirements of the world, and that such condition is likely to continue for several years. The world's visible supply began to increase in 1896, and from July of that year it rose from 2,588,193 bags to 7,128,800 bags on November 1, 1898. declining since to 6,600,763 bags on January 1, 1899 This large supply is about one-half the world's average production for the last two years, and is a bulwark against any "bull" movement until there is a partial failure in supply.

The following table shows the movement of coffee in the United States and Europe in 1898:

	Bags.
Total stocks, U. S., Europe and Brazil, Jan. 1, '98 ...	3,743,363
Receipts in 1898	14,938,654
Total supply	18,682,017
Less stocks, January 1, 1899	4,649,763
Deliveries in 1898	14,032,254
Deliveries in 1897	13,112,159
Deliveries in 1896	11,628,725
Increase in 1898 over 1897	920,095

The deliveries per month in the two countries were as follows:

	United States. Bags.	Europe. Bags.
January	560,754	621,981
February	452,505	605,323
March	531,284	743,915
April	915,690	782,195
May	530,492	890,995
June	341,163	695,972
July	316,486	505,964
August	370,164	592,888
September	436,890	694,948
October	379,403	670,867
November	422,505	709,425
December	567,827	692,618
Total for year...	5,825,163	8,207,091
Average per month...	485,430	683,926

It will be noted from the above that in the United States the deliveries in April were nearly double the monthly average, and that in March and May they were considerably in excess. This movement was due to the withdrawals from licensed warehouses (counted as deliveries) into private warehouses in anticipation of a tax being levied on the article. There has been a revival of the duty question, and it is significant that during the first month Congress is in session deliveries go above the normal.

In 1897 the deliveries in the United States and Europe were 12·78 per cent. greater than in 1896, and in 1898 were 7 per cent. larger than in 1897. It is evident, after making allowance for withdrawals in anticipation of a duty, that there has been an increase in the coffee consumption of the world as a result of big supply and low prices; and there are no good reasons why an increase of 7 to 8 per cent. should not be recorded from year to year during an era of low cost.

Of the 5,825,163 bags delivered in the United States there were 4,643,672 bags of Brazil and 1,181,491 bags of all other sorts; so that Rio and Santos coffee constituted 79·7 per cent. of the total supply.

The total receipts at Rio and Santos in 1898 were 8,895,000 bags, against 10,039,000 bags in 1897. It is claimed that planters have been holding back coffee, and that the crops of Rio and Santos in 1899-1900 will furnish 10,000,000 bags.

The outlook for Java coffee is more favorable for the next than the present crop, the present estimate for next year being 250,000 piculs Government and 350,000 piculs private coffee.

The extension of the industry in Mexico, Central America, and Venezuela has gone forward and supplies from those countries have been increasing, and are likely to for several years to come.

Altogether, it is certain that the world's supply is largely enough in excess of its requirements to keep prices low; and as they are now on a basis of cost commensurate with the relations of supply to demand, it is reasonably safe to carry heavy stocks.—*American Grocer.*

STRAY NOTES ON MANURES.

LIME AS A FERTILIZER.—Prof. H. J. Wheeler, of the Rhode Island Experiment Station, writes to the *American Agriculturist*:—

If your correspondent's opinion that lime is necessary, is not based upon actual tests of his soil, he would do well to test it. Stir up four or five teaspoonfuls of the soil with enough water to make a thick paste. Allow it to stand fifteen minutes. Then part the soil with a knife blade and insert one end of a strip of distinctly blue litmus paper (to be had at any apothecary store), pressing the soil about the paper. After five minutes remove the paper carefully in order not to tear it and rinse quickly with water. If the blue color has disappeared and a red one taken its place, the need of lime is probable. The fingers should never be touched to the end of the paper to be inserted in the soil, for they alone will redden it intensely. It would also be well to test as follows: Take two glasses, place three teaspoonfuls of soil in each and add water till half full; to one glass add two teaspoonfuls of ammonia water, to be obtained of any druggist, stir both thoroughly and again five minutes later. Allow them to settle and if the one to which ammonia was added gives a black inky looking liquid, and the other settles out nearly clear, further evidence of the need of lime is given. The first test should be relied upon if but one is used, but if the second agrees with the first, the case is so much the more certain. Where ime is lacking, beet leaves often turn red and many of the young plants die; lettuce plants also often do the same. One light, sandy soil from 1000 to 2000 lbs. of air-slaked lime may be applied on the furrows and harrowed in, preferably in the autumn. On heavier soil from one to two tons per acre may be used in this manner. On heavy and moist soils, there is less danger from spring applications than on light ones. If air-slaked lime is not to be had, ordinary builders' lime will answer, only the quantity may be reduced in that case to about two-thirds the amount. Place the lumps in piles of 40 to 50 lbs. each and cover with moist soil. In a few days it will be sufficiently slaked so that it can be spread with a shovel. Harrow or cultivate in the lime at once. If there are any lumps, repeat the harrowing or cultivating after two or three days, when they will have slaked so that the lime can be mixed with the soil. If the land is very dry, sprinkle each pile with about half a pail of water before covering it with soil. Twice as much of wood ashes as of air-slaked lime, will also answer. Potatoes planted on limed land should be treated with corrosive sublimate solution or formalin to prevent "scab." Watermelons should, if possible, be planted on unlimed land, or where the lime has been applied two or three years previously.

TEA, COCOA AND COFFEE IN GERMANY.

Mr. R. M. Eckert has supplied the *Ceylon Observer* with the following translation of an article that appeared in the *Chemnitzer Tageblatt*, of 16th December 1898:—

While in former days the consumption of tea and cocoa in Germany, was limited to a small section of the population, it has with the advance of time, extended to larger circles and to-day its consumption extends over a large area.

Different is the case with coffee, which was long ago a well-known drink in Germany and could therefore not have increased in the same proportion as tea and cocoa. All these three products are imported from foreign countries and the consumption can thus easily be authenticated by a reference to the Customs returns.

As to Tea.—In 1862, 741 tons were imported into Germany, whilst in 1897, 2,552 tons were imported. We have therefore during the last 35 years increased the imports by nearly three-fold. This continuous rise was only interrupted during the years 1879-80, owing to the increase of duty from 40 to 100 marks per 100 kilograms, importers getting in as much stock as possible before the 7th July, 1879, the date when the new Tariff charges came into force, and which naturally resulted in a considerable decrease of the article during the following twelve months. The export of tea from Germany is naturally very small, in comparison with the quantity imported. In 1897 the total being only six tons! The

maximum exported was in 1892 when a total of twelve tons was reached.

COCOA.—This article shows a very much larger increase than in the case of tea. In 1862 only 948 tons (cured and uncured) were imported, while in 1897 the total reached 15,473. An increase of sixteen fold! The export was originally small and during the last few years has ceased altogether, the consumption being entirely local. Cocoa has a special interest for Germans, as of late years it has been largely cultivated in our German-African Colonies, whence the export to the mother-country, has been steadily increased. The imports in 1893 being 26·3 tons as against 78·7 in 1897.

COFFEE.—With reference to the consumption of this product, our Custom House Returns show that the imports of raw and mixed coffee (excepting chicory) were 76,979 tons in 1867, whilst during 1897 the total reached 136,395 tons. Coffee originally was largely consumed, whilst tea and cocoa were almost unknown articles. The former has however steadily increased though not in the proportion to the two latter articles—the figures reading: coffee, under two-folds, tea three-folds, and cocoa 16 fold. The export of raw coffee has considerably decreased in latter years, the maximum reached being 56 tons in 1888, whilst in 1897 only 14 tons were exported. The following table shows the imports of coffee from our African Colonies:

in 1889	51·0	tons	1892	137·2	tons	1895	9·6	tons
1890	165·0	„	1893	8·7	„	1896	46·0	„
1891	183·2	„	1894	7·5	„	1897	47·8	„

In comparison with the import of the above articles, it will be seen, from the figures quoted below, that the consumption shows a steady increase, viz.:

	TEA.	COCOA.	COFFEE, IN KILOGRAMS.
1865	0·02	0·03	1·87 per head.
1876·80	0·03	0·05	2·33 „
1896	0·05	0·23	2·46 „
1897	0 05	0·27	2·53 „

We therefore see, that during the last 36 years the consumption of tea, shows an increase of 2½ fold, that of cocoa nine fold, whilst coffee with its fluctuations now shows an increase of 35 per cent. Considering that tea and coffee are supposed to be beneficial to the health of the populace, if consumd in limited quantities only, as against cocoa with its nutritiveeroperties its increased consumption must be encouraging.—This article, in the future, will be of special interest, as it is largely cultivated in our own Colonies.

PLANT FOOD.

The spread of scientific agriculture in India is not rapid, but among European planters, at least, it is making progress, and the results will demonstrate the advantage of giving close attention to the requirements of plant life. Planters now recognise that plants are in some respects similar to human beings: they have their diseases, their friends and their enemies, their likes and their dislikes, their good fortune and their dark days. It may yet turn out that they also have their concerts and their plays; but with this we need not concern ourselves. An Irish friend certainly remarked recently that a Californian Professor had "drawn a parallel between plants and a circle;" but he was unable to state whether the circle had been first squared. Curious as was his expression, however, his meaning was of great interest He referred to a remark of Professor S. M. Woodbridge, of Los Angeles, that in one particular respect plants and their products were like a circle. The circle is composed of three hundred and sixty degrees; if one degree is missing, there is no circle. Similarly, plants are composed of so many elements. If any one of them is missing, there is no growth. All are absolutely essential. Fortunately, however, their number is not very great. In scientific matters some allowance must always be made for the possibility of new discoveries, but as far as has yet been ascertained, there are only fifteen constituent elements of plant life. Take samples of all things in the heavens, and on the earth, and in the waters under the earth; take them from the Himalayas to the Andes, from Finland to Tasmania, from Labrador to the Sahara, or, to fall back on a more hackneyed phrase, "from Greenland's icy mountains to India's coral strand," and all things that you collect can be resolved into some sixty-five constituent elements. The "permutations and combinations" of these make up the infinite variety of Nature; and, says Professor Woodbridge, of these sixty-five, thirty are rare and seldom play a part in the affairs of men; only thirty-five are common.

Narrowing our quest to organised forms of matter, we may take samples of various kinds, from man to microbe, woman to whiskey, ebony to edelweiss, sweet violet to garlic, sugar to gall, and we shall only find that all the known products of growth could be reduced to constituent elements numbering only fifteen in all. Of these, one—iodine—may be at once set apart from the list of land plants, inasmuch as it is distinctly a product of sea-weed. In this way we arrive at only fourteen constituent elements. Dividing these into classes, we have: (1) The air elements, or those that are derived by the plant solely from the air; they are carbon, hydrogen and oxygen. These are always present and in sufficient quantities to maintain their part of plant life. (2) The soil elements, or those that are derived by the plant from the soil. They are potassium, sodium, calcium, magnesium, manganese, iron, sulphur, phosphorus, chlorine and silicon. (3) A class composed of but one element, *viz.*, nitrogen, which is kept apart because it is derived by the plant from both the air and the soil. A combination of some or all of the fourteen elements classified above makes organic life; and this combination is effected by chemical action. All of the eleven elements that the plant takes up from the soil are essentially plant foods, but there are, as a rule, only three that any soil is likely to become deficient in. These are nitrogen, phosphoric acid and potash. These, therefore, are the three chief elements to enter into commercial fertilisers, which constitute artificial plant foods prepared by man.

Recapitulating the deductions of science as expressed by Professor Woodbridge, we bring down to a very small number the constituent elements of plant-life that demand the special attention of the cultivator. There are but fourteen elements in all that enter into plant growth on land. Only eleven of these are derived from the soil, and of these eleven there are but three that soils are apt to become deficient in. It is to these three, therefore, that cultivators must chiefly devote attention. If they grasp this fact firmly, agriculturists will find the study of artificial fertilisers greatly facilitated, and probably rendered interesting also. They will see the reason why such artificial fertilisers may be needed. If one or other of the three elements specially referred to runs short, the plant will suffer; and if the deficiency continues long enough it will die. The primary object of using fertilisers is to replenish supplies of such elements as are defective. The secondary object is to so guide the growth of the plant that it may yield more leaf, or more fruit, or more wood, according to the particular requirements of the cultivator. The coffee-planter wants an abundance of fruit, combined with excellence of flavour; the tea-planter wants an abundance of leaf, again combined with excellence of flavour. But both must remember that the wood of a plant is essential to its health and even its existence. To force the fruit or the leaf too freely is to kill the plant; hence, the planter's aim must be to get, not an absolute maximum yield of berry or leaf, but such maximum quantity as can be obtained without detriment to the health of the plant. With coffee, for instance, the leaves and wood are of secondary importance, but their needs must be considered. The balance has to be so adjusted that the growth of the plant may be vigorous and healthy, with a bent in a special direction, whether that of production of leaf or production of fruit. To know how to train the plant to give of its best in one particular direction, involves a study of the properties of plant foods, especially of the three elements that have been mentioned as those of the greatest importance. Without dipping deep into science, we may say that Dr. Voorhees has acknowledged the general truth of certain popular beliefs as to the properties of these three essentials. Speaking broadly, phosphoric acid specially influences the production of fruit and seeds, particularly the latter. Potash helps to develop the smaller twigs and branches of a plant, which are essential to the transit of plant food from place to place within the limits of the plant. Nitrogen tends to the development of the branches and foliage of a plant. But though we might venture to refer to these as "general principles" Professor Voorhees is careful to show that no hard and fast line can be drawn to show where the influence of any particular one of the three elements named stops, and that of another begins. The influence of potash, for example, is by no means *confined* to the smaller branches.

A certain "balance of power" is essential, and the art of using artificial fertilisers depends for its success on the discovery of what constitutes this balance in particular cases, and the applica-

tion of manures in such proportions as to bring about the balance that is required. We may add, too, that the cultivator must study the physical construction of the plant not only to discover what food it requires, but to find out how that food can be most efficiently administered, or, as medical men might say, "exhibited." The food must be assimilated. The true "mouth" of the plant must be discovered, so to speak: the peculiarities of its "palate" must be considered as well as those of its "digestion." Food must not be forced down its "throat" in lumps. In short, in principle, though not in detail, the feeding of plants is similar to that of human beings. Certain foods are essential to health and strength, but all plants cannot assimilate them in the same proportions; nor can exactly the same results be expected in all cases from the administration of one particular kind of food. The principles are laid down by the scientist. It is in the application of these that scope is left for the exercise of the practical agriculturist's discretion and judgment.—*Madras Mail.*

CEYLON TEA IN AMERICA AND CANADA.

The following are the latest notes received from Mr. Mackenzie with reference to on the past year's work in America and Canada:—

"In sending you a few notes on the work of the year 1898 in the States and Canada, I must lay myself open to the charge of repetition, as I have little that is new to say.

What is of *general* interest has been published *regularly*, and what is of *particular* interest as bearing on our dealings with firms handling our teas, while well known to the Committee, cannot be published.

A great blow was struck at the Tea Industry in the States by the war tax of 5d. per lb. put on at a time when Coffee was unprecedentedly cheap. Many of our friends were disgusted, and lost heart. Several of those who did not believe a duty would be imposed on Tea, unless Coffee were taxed in proportion, sold forward, and have had themselves to bear the burden of the tax on large quantities of Japan teas. This has caused a very heavy loss, and necessitated a reduction in the Tea Departments of several houses.

Reports from some of our allies describe the industry as "dead," the result of the tax on tea as "disastrous," &c.

What the result of the tax on Tea, coupled with the non-imposition of it on Coffee, has been, the following tables will show readily. I take the figures chiefly from the *American Grocer* newspaper.

For several years the average imports into the States have been about 93,000,000 lbs. In 1898 they fell to 68,000,000.

The average consumption per head has averaged for 15 years about 1·33 lb.; in 1898, ·91—a falling off of nearly one-third.

Note the difference in Coffee:

Year.	Imports	Average price	Per head.
1896	572,000,000	14·6 cts.	8·04 lb.
1897	724,000,000	11	9·95
1898	857,000,000	7·3	11·07

Nothing could be more eloquent as regards the check to the former industry, and the impetus to the latter, than these figures.

Later figures, subject however to correction, show that duty was paid on only 12,000,000 lbs. of tea between 1st June and 30th November, 1898, or that the *clearances*, which formerly averaged 93,000,000 lbs. per annum, say 46,000,000 in 6 months, fell to 12 millions for the half year. It was hardly an exaggeration to characterize the industry as practically killed by the tax, and the low price of Coffee.

Under the circumstances it is surely gratifying to find that our Teas have been taken in increasing quantities. It is too early yet to get totals for the year, and I am not in a position to separate the figures for the States and Canada. But, for the first 9 months of the last three years, the combined figures are given as follows by Messrs. Gow, Wilson & Stanton.

	Indian Teas.	Ceylon Teas.
1896	2,500,000	3,038,000
1897	3,900,000	4,555,000
1898	3,483,000	6,252,000

For the year, I should hope "Ceylons" will exceed 8,000,000 lbs. Of course, all this does not prove that only 12,000,000 lbs. were consumed during the 6 months. Something must be allowed for consumption of stocks on hand.

I have already said that some of our friends were disheartened. A few gave up the business, or at all events for the time ceased to push it vigorously. Others seemed to think this slackness on the part of rivals was their opportunity, and launched out more energetically than before. Recently two or three new strong firms. in a position to handle the article over a large area, have joined hands with us. Trade generally in the States has been better than ever before, wages and the standard of living are high, and we may hope that tea-drinking may again be resumed at least up to the old average of 1⅓ per head.

What we have been doing in 1898 is the same as in 1897. viz.: Press advertising, assisting those who advertise, demonstrate, canvass, issue leaflets, send out samples, &c. We find assisting one or more firms to push vigorously in a large city arouses the emulation of others, and this method has proved our most useful weapon.

At the suggestion of Mr. Lane I got a special grant of £500 for Canada a few months ago. I was able to add £1.000 to it from savings in the United States where, during the hot months, we eased off for a time, and where also some subsidies were reduced owing to the *half-heartedness* caused by the duty. Several strong firms are now carrying out the arrangements made with them for pushing our teas in the Eastern Provinces of Canada and elsewhere.

While last in America I saw more of Canada than ever before, and got newspapers from the extreme East to Vancouver. The word "Ceylon" is in universal evidence; and unless when other black Teas are bought because cheaper, our Teas appear to be displacing all other blacks. Against green teas, statistics show we have made no progress, as the imports of Japan into Canada have been larger in 1898 than in 1897. Yet Tea Dealers everywhere assure me "Ceylons" are now making their way rapidly into Green Tea districts. It may be that the great prosperity Canada has been experiencing has caused a larger total consumption of Tea

The Japan Government is now advertising its Teas in the States and Canada to an extent the Indian and Ceylon Association cannot approach.

Fortunately for us we have many friends who are pushing our Teas into all centres where British people do their shopping; and unfortunately, because of their cheapness, our blacks are displacing China teas in blends where China blacks have hitherto been used.

Against Greens I feel certain we have made no progress in the States, nor can we with black Teas. We cannot change the taste of the people within the time which concerns the present race of planters, nor with the funds at their disposal. Any attempt to do so would be—as business—sheer lunacy. To get the trade we must supply what the people want.

I saw recently a copy of Instructions from an American House to travellers they were sending abroad: "When you meet the buyer for any Department of a Foreign House, *remember you know nothing, he knows everything.* Our aim and duty are to make what he sells, not to press him to sell what we make. We cannot afford to make him an enemy, because our goods have been returned on his hands."

I could give several striking instances of this. Let one suffice. One of our friends got his black Teas into nearly 800 shops in a large city a year ago in quantities from 10 to 20 lbs. in packets. When after a year, the Grocers were asked to pay for the Tea, they returned several thousands of pounds in packets now torn, tattered and dirty. Some had sold three pounds in the year, some five, some even ten. What they sold they paid for. Customers pressed to try the Tea seldom repeated their orders. It was not what they were accustomed to drink. The Tea made thousands of enemies. Yet throughout the year, these Teas were most extensively and expensively advertised, many times a week with the town's leading papers, while leaflets and samples were sent out in tens of thousands.

That Ceylon can make green Teas better than those Japan sends to America has now been proved by several lots from the low country as well as the Hills. It rests with the planters themselves to say whether they care to compete with Japan teas in America. or to shift their efforts to other countries where "Greens" are not already in possession of the field.

In a southern paper, where greens are drunk, I saw the following joke. A little girl asked a grocer for a pound of Tea. Grocer: "Black or Green, Miss?" Customer: "Black, I think. *It is for a funeral.*"

TEA, &c., COMPANIES.

The Talgaswela Tea Co., of Ceylon, Limited.—The eleventh ordinary general meeting of the shareholders of the Company was held at Colombo on the 17th instant, to receive the Report of the Directors and statement of accounts for the year ending 31st December, 1898. Mr. J. G. Russell presided. The Report, which was adopted, stated:—

Approximate acreage tea cultivated, 562 acres; tea not weeded, 10 acres; cocoanuts, 150 acres; cinnamon, 50 acres; forest, chena, &c., 1,267 acres.—Total 2,039 acres. The directors beg to lay before the shareholders their eleventh annual report, with a duly audited statement of the Company's affairs, as on the 31st December, 1898. Mr. A. F. Corrie, the visiting agent, last visited the estate on the 3rd November, and reports that the bushes seem everywhere healthy, but that unsuitable weather had rather stopped flush. The yield for the year was 158,189 lbs tea, against an original estimate of 155,000 lbs. It was all sold locally at an average of 34·71 cents per lb. against an average of 38·05 cents per lb. for the previous year. There are not wanting signs that the depression, which has so long overshadowed Ceylon teas in the home market, is passing away, and we hope the current year will witness a higher range of prices than has obtained in 1898. The expenditure on manure was R2,304·42, and debited to revenue account. After paying for this and writing off the usual depreciation on buildings and machinery, the balance at the credit of profit and loss account is R5,756; out of this the directors recommend a dividend at the rate of 2½ per cent. per annum, which will absorb the sum of R5,000, leaving R756 to be carried to the credit of the profit and loss account in 1899. The estimate for the coming season is 160,000 lbs.

The Ceylon Hills Tea Estates Co., Ltd.—The Third Annual Ordinary General Meeting of the above Company was held at Colombo, on 14th instant, Mr. G. F Trail presided.

The Report stated that the crop secured was 389,649 lbs., against an estimate of 472,000 lbs., there being thus a short fall of 82,351 lbs. The nett average price realised was 33·90 cents against 33·73 cents, per lb. in 1897. Details are as follow:—

	Est. for 1898.	Yield in 1898.	Yield in 1897.	Cost in Colombo. per lb.	Nett price obtained in Colombo.
Hardenhuish	150,000	126.267	162,495	29·32	32·14
Agra Oya	120,000	91,140	106,809	34·49	35·41
Laxapanagalla	130,000	109,750	126,200	35·01	32·37
Rowley	44,000	40,451	39,285	34·93	37·92
Bought Leaf	28,000	21,829	26,951		

During the whole of 1898 the Factories never knew a really busy week. Had the yield in 1898 been as large as it was in 1897, the result of the year's working would have been much more satisfactory than is the case, and the most reasonable expectations could not have been pitched lower than this. Mr. Traill fully confirms Mr. R. A. Galton's report that the estates are in excellent agricultural condition, and the factories in first-rate order. In consequence of the poor result of the year's working, the Directors and the Agents and Secretaries have written back their fees. In spite of this, it will be seen that, after writing off R3,700 for depreciation, R2,086·86 on account of coast advances (outstanding on Rowley estate and it is feared irrecoverable), and after providing for interest on debentures and all other liabilities of the Company to the 31st December, 1898, there is a loss on the year's working of R9,962·99, although the working account shews a profit of R9.318·52. The Directors regret that owing to want of funds they have been unable to make any payments on account of debenture interest since 30th September, 1897. The following is a definition of the Company's property as on 31st December last:—Hardenhuish: Tea in full bearing 360, tea in partial bearing 19, forest 200, chena and grass 61. Total 640. Agra Oya: Tea in full bearing 321, tea in partial bearing 62, chena and grass 65. Total 448. Laxapanagalla: Tea in full bearing 346, tea in partial bearing 47, chena and grass 127. Total 520. Rowley: Tea in full bearing 171, chena and grass 474. Total 645. The estimate for this year is 468,500lbs. Tea against an expenditure of R143,444·00, and it will be noted with satisfaction that the yield for January has been larger than it was in the corresponding month of last year by nearly 10,000 lbs.

The British Indian Tea Company, Limited.—The half-yearly report just issued by the above Company shows that the actual outturn was 106,295lb. short of the original estimate of 848,000lb. and 69,635lb. less than the crop of the previous year. The report says: "After the very unfavourable weather of 1897 it was not unreasonable to expect that there would not be a repetition of it in the following year; but, unfortunately, an equally bad season for the growth and manufacture of the tea, both as regards quantity and quality, was actually experienced at most gardens, and this Company's estates were no exception to the rule in this respect. Of the total crop made 548,301lb. have been sold to date at an average of 6·67d. per lb. gross, against 7·42d. for the same quantity disposed of in 1897. In addition to the disadvantageous weather above mentioned, the rate of the exchange ruled 1½d. per rupee higher, and ocean freight rates were about 75 per cent. more than those paid in the previous season. These facts will more than account for a loss, which the Directors regret to say is now certain to be shown on the working of the past season. Since the opening of the tea market this year it is gratifying to note a very distinct improvement in prices, and if this is maintained to the end of the sales of the crop, it will reduce the amount of the expected deficit. Mr. Odling having intimated to his colleagues on the board that he intended visiting Cachar this month, the Directors, feeling it would be for the advantage of the Company that he should go to and report upon its properties there, arranged amongst themselves that he should do so without any expense to the shareholders; it will be satisfactory to have his latest views with regard to these gardens. The total Indian tea crop for season 1898 was originally estimated at 158,681,312lb, but is now reduced to 154,000,000lb, being six millions above that of 1897; the consumption during the past six months has shown an increase of over eight millions as compared with that of the same period in the previous year."

Claremont Estate Company, Limited.—The Fourth Ordinary General Meeting of the shareholders of the Claremont Estate Company, Ltd., was held at Colombo, on 18th instant. Mr. R. Huyshe Eliot presided; the report states:—

ACREAGE.	
Tea in bearing	200 acres.
Tea planted, 1895	46 ,,
Forest, Ravines, &c.	90 ,,
Total ..	336 ,,

The yield for the year was 80,022lbs. against an estimate of 80,000lbs., or just over 400lbs. per acre, costing in Colombo 23·38 cents per lb., after deducting R1,500 on capital account. The tea was all sold locally, realising 33·10 cents per lb. nett. The estimate for 1899 is 85,000 lbs.

Maha Uva Estate Company, Ld.—The Sixth Ordinary General Meeting of the Maha Uva Estate Company, Ltd., was held at Colombo, on 18th instant. Mr. G. H. Alston presided. The report stated:—

ACREAGE.	
Tea in full bearing	499 acres.
Tea in partial bearing	100 ,,
Tea not in bearing	25 ,,
Cardamoms	85 ,,
Grass	15 ,,
Total cultivated ...	724 ,,
Jungle and Waste land, &c.	234 ,,
Total of Estates ...	958 ,,

The crop secured amounted to 198,383lbs. tea as against 179,263lbs. in 1897, being 32,000lbs. below the estimate for the year; this deficiency is accounted for by the short rainfall during the first eight months of the year. The nett average price realized was 42 cents per lb. as compared with 43 cents in 1897. Of the cardamom crop 3,751 lbs. were sold for R6,435·53, or about R1·71 per lb., leaving about 460lbs. yet to be realized, which has been estimated at R1·50 per lb. There was also a small quantity of coffee, 285 bushels, which fetched R1,545·20, but very little more of this product may be expected. After making the usual ample provision for depreciation of Buildings and Machinery the amount at credit of Profit and Loss account for the year's working is R15,806·19, equal to 6·27 per cent. on the capital of the Company; this with the balance of R5,789·20 brought forward from the previous year makes a total balance at the credit of Profit and Loss account of R24,595·39. The Directors recommend the payment of a dividend of 6 per cent. for the year, and that the balance of R6,595·39 be carried forward to the current year's account.

The estimates for this year are 230,000 lb. tea, 100 bushels of

cherry coffee and 6,000 lb. cardamoms, on an expenditure on the estate of R65,838·89.

Kirklees Estate Company, Limited.—The Fourth Ordinary Annual General Meeting of the Kirklees Estate Company, Ltd, was held at Colombo, on 18th instant, Mr. G. H. Alston, (Chairman). The report stated:—

ACREAGE 31ST DECEMBER, 1898.

Tea in full bearing	327 acres.
Tea in partial bearing	50 ,,
Tea not in bearing	23 ,,
New Clearings	45 ,,
Timber and Cardamoms, about	105 ,,
Uncultivated Land	167 ,,
Total..	717 acres.

The crops secured during the year were 106,852 lbs. tea and about 1,108 lbs. cardamoms, and in addition 4,564 lbs. tea were manufactured from bought leaf. The average net prices realized were 39·33 cents per lb. for the tea and R1·62 for the cardamoms. In addition to this 44⅜ bushels cherry coffee were harvested, which sold for R213 and R1,680·60 was received for the manufacture of outside leaf. After making ample provision for depreciation of Buildings and Machinery and setting aside a sum of R500 to cover possible loss of coast advances for which the Directors consider it advisable to make provision, the profits for the past year amount to R1,867·37, to which has to be added R3,617·37, the balance brought forward from 1897, making a total of R5,484·84 available for dividend. The directors now recommend the payment of a dividend of 4 per cent. for the year, leaving a balance of R1,484·84 to be carried forward to the current season's account. The crop secured fell very short of the estimate of 130,000 lbs. This shortfall was caused by the abnormal dryness of the season, and may also be attributable partly to its having been considered advisable during the year to prune nearly the whole of the older tea. The crop for the current year is estimated at 125,000 lbs. tea and 2,500 lbs. cardamoms, on an expenditure on the estate of R38,911·73. During 1898 a net sum of R6,899·53 was expended on capital account in opening up 45 acres tea and planting fuel trees, the up-keep of the acreage not yet in bearing and the erection of a cardamom house for preparing the increasing crops of this product. During 1899 the capital expenditure is estimated to amount to only R2,860.

Yataderia Tea Company of Ceylon, Ltd.—The Annual General Meeting was held, at Colombo, on 18th instant. Mr. H. V. Masefield in the chair. The report stated:—

After providing R3,277·73 for depreciation of Buildings and Machinery, the profit for the year is R49,294·77 to which must be added R6,187·07 balance from 1897. An interim dividend of 10 per cent absorbing R19,000 was paid last August, and the Directors propose that a further dividend at the rate of 15 per cent. absorbing R28,500 be declared and made payable on 20th instant, that R2,500 be transferred to the reserve fund to bring this fund up to R47,500, equal to 25 per cent. of the share capital, leaving a remainder of R5,481·84 to be carried forward. It will be seen that the property representing capital stands in the balance sheet at approximately R200 per acre cultivated, as compared with about R204 in the previous year's accounts, and that the profit is R61 per acre in bearing, and 25·94 per cent. on the capital. The total tea crop was 548,306 lbs. or 12,306 lbs. more than estimated in the last report (though 46,344 lbs. less than was estimated when the half-yearly meeting was held—the latter part of the year having been unfavourable). The plucking area was 805 acres. The total quantity of tea for disposal was 551,829 lbs including 3,523 lbs., made from purchased leaf, of which 68,493 lbs. were sold locally, averaging 26·78 cents per lbs., and 483,336 lb. were shipped to London, of which 88,153 lbs. had still to be accounted for; but the average obtained for the 463,676 lbs. as yet accounted for is 29·32 cents per lb. The cost of the tea delivered to buyers or put on boardship, including all charges and depreciation of Buildings and Machinery, was 20·20 cents per lb. (being 1·80 cents less than in 1897.) The net value realised from sales (a portion being estimated,) was 29·81 cents per lb (being ·13 of a cent less than for the previous crop.) The sum written off for depreciation represents ·59 of a cent per lb. of the cost. During the year 13,000 more pará rubber trees and 3,860 more cocoanut trees have been planted at an expenditure of R1,326 borne upon the year's revenue account. The directors propose an extension of 10 acres tea in 1899. The estimated crop for 1899 is 555,000 lbs. tea.

On the motion of Mr. A. Orchard, seconded by Mr. J. A. Martin, a dividend of 15 per cent. for the half-year, making 25 per cent. for 1898. was declared.

Castlereagh Tea Company of Ceylon.—The Annual General Meeting of shareholders in this Company was held at Colombo, on 18th instant, Mr. J. H. Starey, Managing Director in the Chair. The report of the Directors stated that the balance of profit (including R1,745·43 brought forward, and after writing off for Depreciation of Buildings and Machinery as shown in the accounts) is R20,541·27. Of this sum R7.200 has been absorbed in paying an interim dividend, at the rate of 3 per cent. The Directors propose, after placing R469·89 to Reserve Fund, being 2½ per cent. on the Profits, as resolved on in General Meeting, to declare a further dividend at the rate of 4 per cent. payable on the 20th February, absorbing R9,600, and after paying a bonus of 5 per cent. on the profits divided, including Reserve Fund, for the year to the Superintendent, in terms of a promise made to him, absorbing R863·49, to carry forward to 1899 accounts R2,407·89. The total Tea crop was 174,185 lbs. against the estimate of 205,000 lbs. the season having been unfavourable, particularly in the later months. The cost of the tea delivered to buyers was 26·70 cents. per lb. or 24·68 cents. exclusive of charges for Depreciation of Buildings and Machinery. The tea was all sold locally, realizing 39 cents. per lb. leaving balance of gain 12·30 cents. Cost in 1897 was 31·48 cents. and value 38·16 cents. per lb.

The Company's Property consists of:—

476 acres	Tea under leaf.	Yield in 1898 = 366 lb. tea per acre.
4 ,,	planted in 1897.	
4 ,,	,, 1898.	
42 ,,	Forest.	
Total...	526 acres.	

About 4 acres were brought into cultivation during the year, cost of this and of up-keep of the 4 acres of 1897 being charged against revenue. The estimated crop for 1899 is 195,000 lb. tea, or 409 lb. per acre.

SILVER-PRICES IN INDIA.

CAPTAIN E. F. MARRIOTT, *Indian Staff Corps; late Assistant-Secretary to the Military Department of the Supreme Government has written as follows to the* FINANCIAL NEWS:

In the *Times* of August 17, 1897, an article was published on the closing of the Indian mints. The arguments used were based on a pamphlet by Mr. Atkinson: "Silver-Prices in India." Mr. Atkinson has republished these figures in The FINANCIAL NEWS of December 13 last. and has reiterated the fallacy that these figures are indexes of the value of the rupee for the years with which they deal.

Let me preface my criticism by saying that the pamphlet from which Mr. Atkinson's figures are taken has been evidently compiled with great care and pains; that the figures are, no doubt, trustworthy, and give an accurate picture of the variation of prices in India. The diagram based on these figures, to which Mr. Atkinson refers, shows clearly years of plenty and years of dearth, the spread of railway communication, and the local changes which increased facilities of communication bring. But the figures in this pamphlet are absolutely worthless in giving any useful answer as to the changing values of the rupee. and the author is completely wrong in the conclusions he draws on this point.

In attempting to gauge the value of a commodity by which the comparative values of all other commodities are measured we should, it is plain, eliminate as far as possible all variation of prices which local causes may induce. We should, therefore, if we are to obtain a trustworthy measure, base our calculations on the prices of *only such commodities as have been subjected to the higgling of the markets of the world.* All economists hitherto have recognised this; Sauerbeck, Soetbeer, Palgrave, &c., have been careful to include only the prices of the great staple products of the world in their measures of the value of gold; but Mr. Atkinson has so entirely misunderstood the nature of the problem he is dealing with that he has, as far as possible, excluded from his tables all such articles. "A few" (prices) "only," writes Mr. Atkinson in his pamphlet, "when figures were not elsewhere obtainable, have been taken from the export accounts." Now, the mistake which Mr. Atkinson makes

in his choice of measures for the value of the rupee lies not only in the commodities themselves, but in the places whence the prices are obtained. It is plainly no help to a correct answer as to the value of the rupee to select "ragi" from some market where the price ranges from 57 to 58 seers to the rupee: nor does it help us to a right estimate to include the price of "jawar" at Salem, which ranges from 45 to 48 seers at that place; nor does the price of "bajri" at the same market help us. Yet these are fair examples of the commodities and places whence the author draws his conclusions.

It is curious that the author himself gives on pages 13 and 14 of his pamphlet full reasons for rejecting his prices as an index of the value of the rupee, and with extraordinary completeness demolishes the grounds of his own argument. I say without fear of contradiction that Mr. Atkinson's method of arriving at the value of the rupee includes so many elements of error as to lead to a wholly worthless result; I need, in fact, but set down some of these results to ensure every one of my readers agreeing with me. Here are a few of the numbers which, according to Mr. Atkinson, go to form indexes of the value of the rupee in certain years.

1871	100	1882	105
1878	148	1892	141
1895	128		

These figures, no doubt, indicate the famine prices of 1878 and the prosperity of 1882; but they are plainly no index to the value of the rupee; if they were, we should have to accept the fact that the rupee was of lower value in 1878 than at any time before or since for the last fifty years, and that in 1895 the rupee was of considerably higher value than in 1892.

Now let us compare these figures with some real index numbers published by Mr. Atkinson himself in India in the *Pioneer*, and taken exclusively from the prices of exports—the prices, that is, of commodities subject to the higgling of the markets of the world. Mr. Atkinson then wrote. "The index numbers of 90 per cent. of Indian exports taken from their declared values, and treating 1871 as 100, were:—

1881-82 ..... 98·9	1882-83 ..... 92·7," &c., &c.

(See below.) These are real index numbers; for they are drawn from the prices of commodities which the whole world has entered the market to buy, and the answers they give as to the changing values of the rupee must be, if the figures are accurate, approximately correct. That they are approximately correct we can have no doubt at all, after comparing these answers with those given by similar measures of silver compiled from the prices of certain staple commodities at Chinese ports. I published in the *Pioneer*, in reply to Mr. Atkinson, comparative table of his Indian and my Chinese index numbers, and I showed that the average level of silver for the eleven years 1882–92 was, according to Mr. Atkinson's Indian tables, 96·8, according to the China tables 96·5; the year 1871 was the Indian standard of comparison, the years 1870–74 the Chinese standard, and in each case was represented by 100.

I give here, side by side, these two interesting and mutually corroborative tables:—

Mr. Atkinson's Indian prices.	My Chinese prices.	Mr. Atkinson's Indian prices.	My Chinese prices.
1871 ...100	1870–74...100·00	1887 ... 92·7	... 95·5
1881-82 ... 98·9	... 96·1	1888 ... 95·9	... 97·2
1883 ... 92·7	... 99·4	1899 ... 99·6	... 96·8
1884 ... 94·5	... 92·4	1890 ...103·9	...100·4
1885 ... 94·6	... 92·0	1891 ... 98·2	... 94·5
1886 ... 92·9	...100·1	1892 ....100·4	... 96·9

The average level of the eleven years is, as I have said, according to the Indian tables 96·8, according to the China tables 96·5. The average rise of silver in value is thus 3·2 per cent. above the Indian level of 1871 and 3·5 per cent. above the China level of 1870-74. We may therefore safely conclude that each of these tables practically tells the exact facts as to the average value of silver during those years; but Mr. Atkinson, in his eagerness to disprove the theory of silver stability which he had himself helped all unconsciously to establish, has now drawn his conclusions from a mass of facts which could give no correct answer to the questions he put to them. Mr. Atkinson has evidently given much time and pains to his pamphlet, which is, no doubt, a very useful record of local and temporary changes of price, and he cannot be blamed for a certain blindness as to the true conditions of the special problem under consideration; anyone may become confused on these matters; but it is curious that, once having perceived that a true index number for the value of silver and the rupee can only be obtained from the great stable commodities of the world, Mr. Atkinson should have gone back from this sound position, and should have sought to prove, from local prices and from the prices of commodities used here and there by comparatively few, that the rupee had varied greatly in value, and had fallen considerably between 1881 and 1890 solely owing "to the great expansion of the currency."

Lest by any chance the point of my argument be misunderstood, let me repeat that, as far as the figures I am attacking are used as indicators of temporary and local changes of price, so far they may be of practical use; but they are wholly worthless as measures of the value of the rupee. Had the author understood the problem, he would have known that three, or even two, stable commodities, unconnected in conditions of production, supply, and demand, and subject to the higgling of the markets of the world, would have given a far truer answer to his question than the hundred commodities he chose; and I would point out, and emphasise the fact, that Mr. Atkinson had, long before the publication of this pamphlet, set forth more useful index numbers of the value of the rupee, exactly corroborating, as I have above shown, the deductions I had drawn from prices in China. And where, I ask, could anyone obtain more perfect proofs of the general stability of silver, and its non-depreciation up to 1892, than in the table I have published above? For the result arrived at from the China prices is corroborated by tables of Indian export prices, drawn up by one who has ever denounced the stability of silver (up to the date of closing the mints) as a ridiculously absurd theory.

And, lastly, assuming that this stability of silver before the mints were closed is an established fact, I would ask whether stability is not the one pre-eminent virtue in a standard of value, and whether, therefore, it could be wise to dethrone this so virtuous a metal and set up gold to reign in its stead.

DISTRICT ASSOCIATIONS.

WYNAAD.

Proceedings of a Committee Meeting of the Wynaad Planters' Association held at Meppadi, on 8th February 1899.—PRESENT: Mr. H. B. Winterbotham, (*in the Chair,*) G. W. Hockin, D. Mackenzie, G. R. Malcolm, S. Robinson, R. K. Walker and E. de Fonblanque, (*Honorary Secretary*).

Coffee Robbery.—*Read* letter from Capt. Carslake on the subject.

Resolved.—That a subscription list be circulated at the next General Meeting.

Read letter from Mr. H. Atzenwiler.

Read letter from the District Magistrate, Manantoddy, asking for Coffee Robbery returns to 31st December 1898.

Resolved, that the Magistrate be informed of two cases of theft on Callamulla Estate, and that Mr. Atzenwiler's letter be quoted.

Roads.—*Read* letter from the President, District Board, Malabar.

Recorded with thanks.

Read copy of Government Order, of 13th December 1898, on the subject of Government Grant to the Calicut-Choladi and Chundale-Sultan's Battery Roads

Resolved.—That the Secretary be requested to write to the Executive Engineer, P. W. D., asking him to take prompt measures to take over charge of the Sultan's Battery Road, as the late contractor has relinquished it; also asking him to expend the special allotment given by Government for this purpose as soon as possible.

Pudu Padi Post Office.—*Read* letter from Postmaster General.

Recorded.

U. P. A. S. I. Financial year.—It was decided to bring this matter before the next General Meeting.

Treasury Drafts.—*Read* letter from Mr. H. Waddington.

Resolved that the Secretary thank Mr. Waddington for his letter, and point out that in the case of Coorg surplus funds only are sent from Mangalore: and that with regard to this district the same circumstances do not occur.

Plague.—*Read* letter from the Collector of Malabar.

Resolved that the Association is prepared to meet the Collector's views on the subject of segregation huts on each estate.

Mr. D. Mackenzie was asked to write to the Secretary, giving details of the case of his Maistry being detained by plague authorities on the frontier on his way into Mysore: to be forwarded to the Collector.

Tea and Coffee Samples.—*Read* letter from Captain Carslake.

Resolved that Capt. Carslake be asked to personally bring the matter before the next general meeting.

Labour Ordinance.—The Secretary was requested to inform the Secretary, U. P. A. S. I., that the subject of his letter will receive the serious attention of the Association.

General Meeting.—It was decided to hold the next general meeting on the 1st March.

A vote of thanks to the Chair closed the Proceedings.

E. DE FONBLANQUE,
Honorary Secretary, W. P. A.

SHEVAROY.

Proceedings of a Special General Meeting of the Shevaroy Planters' Association to consider the correspondence forwarded by Government with regard to the proposed New Ghaut Road, held in the Victoria rooms, at Yercaud, at 1 P.M., on Monday the 13th February 1899.—PRESENT: Messrs. Rahm, S. M. Hight, C. D. Ricketts, E. Dickins, C. K. Short, W. J. Lechler, Revs. J. M. Kempf, M. Andersen, Messrs. Thurston Short, C. Rahm, C. A. G. Turner, J. C. Large.

PROXY.

Mr. W. Hight, by Mr. S. M. Hight.
Mr. H. R. Newport, as a *Visitor*.
Mr. C. G. Lechler, *Chairman*; Mr. R. Gompertz, *Hon. Secy.*

1. Notice calling the meeting was taken as read.

2 Mr. Hight and others objected that sufficient notice of the meeting had not been given and thought that it should be postponed. The Honorary Secretary explained that he considered the matter urgent and had sent a notice to every member at present on the Hills and that there were several precedents of the usual notice having been dispensed with, on the plea of urgency. No formal motion was proposed, but on the Chairman's calling for a show of hands, it was found that the majority were in favor of the business being proceeded with.

3. The Honorary Secretary then read out the correspondence referred to, *viz.*, G. O. No. 210 W. of 23rd January 1899.

4. After a lengthy discussion, the following motion was proposed by Mr. W. J. Lechler, seconded by Mr. J. C. Large.

Salem is the capital of the District, and a cart road is wanted from Yercaud to *Salem* - not merely to the plains. A very much larger number of Planters are in favor of Bailey's, than of any other road. The Chief Engineer states in his note of 3rd December last (para. 3, page 5 of the G. O.) that the distance from Yercaud to Mullapooram is 25 miles, whilst that by Bailey's Ghaut to Salem station is about 19. Salem is a town of some 80,000 inhabitants, from which all supplies from the Hills are drawn. Mullapooram is a small village. All—or almost all—the manure imported, and the coffee exported, comes from, and goes to, the Western, not the Eastern coast. The Rail distance to the West coast is 27 miles longer from Mullapooram than from Salem. Moreover it is believed that the Madras Railway Authorities contemplate the construction of a light railway from Salem Railway station (Suramangalam) to the foot of the Salem Ghaut where Bailey's trace begins, which would bring Yercaud within 13 miles of the Railway.

In view of these facts, I propose that Government be respectfully urged to sanction the construction of Bailey's road; and be informed (with reference to para. 13 of the note of the Chief Engineer, of 3rd December 1898) that the construction of a cart road to Mullapooram, or to any other place than Salem, could not be "accepted as a final solution of the question, and a fulfilment of the promise of Government."

AMENDMENT.

Proposed by Mr. T. Short.
Seconded by Mr. S. M. Hight.

That this meeting be adjourned till Monday the 20th instant at 1 p.m. *Carried.*

The meeting was accordingly adjourned till the 20th instant, when the above motion will be put.

(Signed) C. G. LECHLER,
Chairman.

(„) R. GOMPERTZ,
Honorary Secretary.

Proceedings of an adjourned Special Meeting of the Shevaroy Planters' Association held in the Victoria Rooms, on Monday the 20th February 1899, at 1 P.M., to consider the question of the proposed Carriage Road up the Ghaut.—PRESENT: Messrs. King-Harman, S. M. Pritchard, Thurston Short, Fred. Short, C. K. Short, Bruce Short, C. D. Ryle, R. A. Gilby, Rev. J. M Kempf, Messrs. S. M. Hight, W. Hight, J. C. Large, C. Rahm, C. Dickins, E. Dickins, C. A. G. Turner, C. D. Ricketts, Rev. M. Andersen, Mr. C. G. Lechler, *Chairman*; Mr. Gompertz, *Honorary Secretary.*

PROXIES.

Mr. L. E. Kirwin	...	By	...Mr. King-Harman.
„ C. Rahm, Senior „ W. Rahm „ D. S. Robinson		By	Mr. C. Rahm.
Mrs. Dickins	...	...	...Mr. E. Dickins.
„ L. Ricketts	...	...	...Mr. C. D. Ricketts.
Mr. W. J. Lechler Mrs. Gaitskell Mr. A. G. Nicholson „ E. G. Windle „ H. B. Evans			...Mr. C. G. Lechler

1. The Chairman read out G. O. No. 210 W., dated 23rd January 1899.

2. Also the Proceedings of a Meeting of eleven Planters (of whom five do not belong to the Association), held at Nagalore on the 17th instant.

3. After much discussion,

The Chairman read out the motion proposed by Mr. W. J Lechler and seconded by Mr. J. C. Large, on the 13th instant.

AMENDMENT.

Proposed by Mr. Thurston Short.
Seconded by Mr. S. Hight.

That the Mullapooram Ghaut be accepted as a solution of the question, and a fulfilment of the promise of Government to meet the requirements of the Planters, for the following reasons :—

(*a*) *Cost* 1½ lakhs against 4 lakhs, Bailey's trace.
(*b*) *Distance*—about the same, 19⅓ against 20 miles.
(*c*) *Cost of upkeep—nil* in comparison with Bailey's trace.
(*d*) *Water*—natural supply against expensive storage.
(*e*) Ready for traffic in one year against three years or more.
(*f*) Taps a larger planting interest.
(*g*) Taps a larger number of villages en route.
(*h*) Of the 19⅓ miles Mullapooram Ghaut Road, 5 miles have been kept up by the District Board Fund; thus there is an annual saving in upkeep of five miles.

Mr. Gompertz spoke against the amendment, pointing out (*a*) that it had never been asserted that Bailey's Ghaut would cost more than three lakhs, whilst contractors were willing to construct it on the original estimate of a little over two lakhs; (*b*) that the Chief Engineer, in the G O under discussion, called the distance in one place 25 miles, and in another 22, but never 19½ or 20; (*c*) that it was absurd to say that the upkeep would be *nil*, in comparison with Bailey's road. Once made the upkeep of the Ghaut, mile for mile, must be nearly the same; (*d*) that he personally knew of a stream that ran about half-way down the Ghaut (and had no doubt it found its way to the bottom) in close proximity to Bailey's trace; (*e*) that absolutely no grounds had been given for the unlikely assertion that Mullapooram Road would be ready for traffic in one year, whereas Bailey's trace would take three; (*f* & *g*) that these were merely assertions, which if true, were capable of easy proof, in the absence of which he must flatly deny them; (*h*) and that the amount spent on the upkeep of the Nagalore Road by the District Board would be totally inadequate to keep it in repair under the increased traffic which must result if it became part of the Ghaut Road.

The amendment was then put to the meeting and lost by 20 votes to 10; Mr. Gilby not voting.

The original motion (Mr. Lechler's, in favor of Bailey's trace) was then put and carried by 22 to 9.

4. Proposed by Mr. Bruce Short.
Seconded by Mr. S. M. Hight.

That as many Planters are not members of the S. P. Association its decision would not be that of the Planters of Shevaroy Hills that, therefore, statistics of coffee and native grain cultivation served by each Ghaut (the Mullapooram and Bailey's) be sent in for the information of Government.

1ST AMENDMENT.

Proposed by Mr. Gompertz.
Seconded by Mr. King-Harman.

That the acreage under coffee of all the Planters who vote for Bailey's Ghaut and for the Mullapooram Ghaut be sent in to Government.

2ND AMENDMENT.

Proposed by Mr. Kempf.
Seconded by Mr. C. Dickins.

That statistics be obtained shewing the amount of supplies of all kinds coming up and going down the Nagalore side and also on the Salem side for the information of Government.

The second amendment having been put to the meeting and carried, neither the 1st amendment nor the original motion were put to the meeting.

5. The Honorary Secretary stated that he was uable to furnish these statistics himself, but said he would endeavour to obtain them from the Tahsildar.

6. The meeting terminated with a vote of thanks to the Chairman.

(Signed) C. G. LECHLER,
Chairman.
(„) R. GOMPERTZ,
Honorary Secretary.

MARKET REPORT.

[*Per Mail advices of 3rd February* 1899.]

COFFEE.

There has been considerable irregularity in the market during the week, says the *London Commercial Record*. Ceylon of poor quality realised very full values, whilst for the fine lots extreme rates were obtained. Further parcels of new crop East India, including Coorg of much better quality than other descriptions previously offered, have been brought forward, and these sold with good competition at very full to higher prices; Neilgherry and Wynaad were for the most part of poor quality and only partly disposed of. Transactions in Costa Rica have chiefly consisted of old import "without reserve," which sold at easier rates. There was a better demand for Guatemala at improved prices. There has been fluctuations in "futures," and, although the best prices are not maintained, closing quotations shew a slight advance for the week, viz :—

London	Santos	March delivery	31s 6d.
New York	No. 7 Rio	„ „	5·65 cents.
Hamburg	Santos	„ „	32¼ pf.
Havre	Santos	„ „	38¼ francs.
Holland	Good ordinary Java		31 cents.

At the Dutch Trading Company's public sale held in Amsterdam on Tuesday, 24,458 bags 36 cases were offered and sold at an irregular decline, chiefly below valuations, good ordinary Java realising 31 cents, against 32½ cents in November last. The following are some of the particulars:—

Lying in Amsterdam.

No.	Bags.	Valued at. Cents	Result. Cents.
1	495	33	31 @ 31¾
2	2,878	31	29 „ 29¾
3	1,276	31½	30
5	597	42	40½
6	1,464	42½	39¾ @ 40½
7	1,787	43	40 „ 40¼
8	908	42	39¼ „ 40
9	957	48	47¼ „ 48
10	1,812	50	49 „ 51

Receipts in Rio and Santos.

Since July 1	1898-9.	1897-8.	1896-7.	1895-6.
Rio	2,121,000	3,014,000	2,478,000	1,806,000
Santos	4,224,000	4,850,000	3,940,000	2,584,000
Total	6,345,000	7,864,000	6,418,000	4,390,000
Crop	10,461,000	8,680,000	5,489,000	

Auctions to-day comprised :—424 bags East India, 20 casks 5 tierces 4 barrels Ceylon, 45 bags Nyassaland, 191 barrels 418 bags Jamaica, 82 half-bales Mocha, 379 bags Guatemala, 132 bags Salvador, 375 bags Columbian, 40 bags Mexican, 17 bags Costa Rica, 196 bags Venezuelan, and 43 bags Peruvian. The sales went off quietly, at full rates for good qualities, but inferior kinds were neglected and lower.

Messrs. Wm. Jas. & Hy. Thompson's Report of the Colonial Market for the week ending February 1st, 1899, *states* :—

This market is firmer for all kinds, and the demand at auctions has been good for all Coffees of recent import. East India, of which the supply has been more important, has gone off irregularly, extreme prices being paid for good colory Coorg and Mysore, whilst medium and ordinary are slow at very moderate prices. The better kinds of Colombian show an advance of 1s to 2s. per cwt., in some cases even more. Brazil markets continue steady but quiet.

The Dutch Sale held yesterday in Amsterdam, when 24,458 bags and 36 cases were offered, went off irregularly at about 1½ cents below last sale. good ordinary Java selling at 31 cents against 32½ cents at the last sale.

Futures have been firmer, and although prices have fluctuated, the close shows an advance of about 6d. per cwt., *viz.*:—Good average Santos in Havre, March delivery, fcs. 38·25, in Hamburg pf. 31¾, and No. 7 low ordinary Rio in New York $5·65.

Daily receipts averaged 9,500 bags in Rio, and 12,300 bags in Santos.

To-day's London official quotations are :—

	Feb.	Mar. '99.	May.	July.	Sept.	Dec.
SANTOS	31/6	31/9	32/3	32/9	33/3	33/9

TEA.

INDIAN.—Sales were slightly heavier, totalling 49,300 packages, compared with 47,300 packages in the preceding week and 35,500 packages for this period of the year before.

Competition was again good for the best liquoring parcels and for these quotations were fully maintained, except in the case of Broken Pekoes, which were less in demand and occasionally did not sell at previous rates Leafy descriptions were in most favour, and on the whole passed steadily. Common Pekoe Souchongs and Broken Teas did not seem to be in quite so much request, and were here and there a little easier.

From South India there was an increased quantity offered, comprising 1,800 packages, chiefly from Travancore, which were on the whole of a useful character.

For 38,500 packages on Estate Account 9½d per lb. was obtained, contrasted with 8¼d per lb. for 29,400 packages in the former season.

Totals printed in January were :—

1899.	1898.	1897.
221,100 pkgs.	230,600 pkgs.	199,300 pkgs.

The figures just issued by the Tea Brokers' Association indicate that deliveries have of late been going on satisfactorily, being from the 1st to the 31st ult., 12,916,000 lbs. versus 11,593,000 lbs in the same time of 1898, while the stock is nearly 4 million lbs. below.

CEYLON.—Supplies were rather larger, aggregating 26,500 packages, whereas on the 24th ult. 20.900 packages were brought forward, and 32,500 packages a year ago.

A firm tone prevailed for common to fair Pekoe Souchongs and Pekoes, which in a few instances were slightly dearer. Fine Pekoes and Orange Pekoes were also more wanted for the Continent, and improved rates were often paid to secure them. Medium Broken Pekoes marked considerable irregularity, and for the least desirable lower prices had sometimes to be accepted. Parcels with fine quality, however, held their own, the few choicest bringing full figures.

The average is 8½d per lb. On the 26th ult. it was 8¼d per lb. and 7¾d per lb. in 1898.

JAVA.—Nearly 2,000 packages were submitted to the trade and went off with fair spirit, there being no material change to record.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon and Java Tea Report, dated January 27th, 1899, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON,
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	1,111,808 pkgs.	745,875 pkgs.	29,183 pkgs.

47,969 pkgs. Indian
21,466 „ Ceylon
1,357 „ Java
} Total 72,297 packages were offered in public auction this week.

Figures for the first seven months of the season as shown in the official returns are given below.

Indian. Supplies were readily taken by the trade at prices fully up to last week's rates, the tendency being rather in favour of sellers. Many of the offerings are showing slightly improved quality The first closing invoice from Darjeeling is catalogued for next week. The following averages are worthy of note:—"Okayti T Co.," 1/11½; "Brit. Darj. Co. Thurbo," 1/7¼; "Upper Ass. Co. Nudwa," 1/5¼; "Ass. Fron. T Co Hapjan," 1/4¾; "Budla Beta" and "Doom Dooma Co. Samdang," 1/4½.

Ceylon. The market was strong for all grades and there is now very little whole leaf Tea to be had under 5¾d while anything with really good quality continues to command rather improved prices. The following averages may be mentioned:—"Hornsey," 1/0¾; "Henfold," 1/0¼; "Campion," 1/-; "S. T & L. Co. Brookside," 1/-; "Wanaraja," 11¾d.

Average for week 8·17d., against 8·16d. for same period 1898.

Ceylon Tea sold on Garden Account, 1st Jan. to date 1899, 80,429 pkgs., av., 8·08d. 1898, 83,688 pkgs., av., 8·26d.

		1899.	1898.	1897.	1896.
PEKOE SOUG.	(Ordinary leaf; fair liquor)	6½d.	6½d.	6d.	6½d.
PEKOE	(Ordinary leaf, little twist; fair liquor)	7¾d.	7½d.	7½d.	7¾d.
PEKOE SOUG.	(Rather bold leaf; indifferent liquor)	5½d.	4¾d.	5d.	5½d.
PEKOE	(Somewhat bold leaf; indifferent liquor)	5¾d.	5¾d.	5¾d.	5¾d.

Java, sold very steadily in sympathy with other grades, the tendency being towards dearer prices. 1,973 packages are catalogued for next week.

NOTE :—In last week's issue we gave the Ceylon weekly average for 1897 instead of that for 1898, viz.—8·28d.

COCOA.

At public sale on the 31st ult., 4,335 bags were brought forward, and about 3,200 bags found buyers at very firm prices to 1s to 2s. per cwt. advance. 645 bags Trinidad nearly all sold at 72s to 75s. for good middling to fine red, being fully valuations. 580 bags Grenada realised 70s to 72s for fine red, 68s to 69s for good, and 66s to 67s for common, showing an advance of 6d to 1s rise on the fine grades. 65 bags Dominica sold at 1s rise—67s for fair, and 64s 6d to 66s for common to middling. 39 bags St. Lucia brought 69s to 70s, and 3 bags St. Vincent 64s 6d. 397 bags Jamaica sold at 1s over last auctions' rates, *viz.*, 66s to 69s 6d for fair to good fermented. Of 282 bags Samana, 80 bags brought 65s 6s to 66s. Of 1,377 bags Guayaquil. 280 bags sold at 68s to 70s for gray to fair Caraquez, and 67s to 67s 6s for Tumaco. 8 bags Columbian sold at 70s 154 bags Bahia were placed at 70s for good red. 785 bags Ceylon sold at 70s to 75s for good bold and medium red, 64s 6d to 69s for medium and small, 60s for pieces, exhibiting a rise of 1s to 3s on the finer grades. Private business includes 200 bags fair to good Bahia at 68s to 70s, 100 bags African at 70s, and 600 bags Guayaquil—good red Caraquez 72s, summer Arriba at 80s, and winter ditto at 71s per cwt.

PEPPER.

BLACK —The market has been very firm this week on the return of small shipments and a speculative demand. The tone yesterday was, however, quieter. Sales of Singapore have been made on the spot at 5 3/16d to 5¼d for fair, at 5 7/16d to 5½d January-March (s.), and at 5 9/16d to 5⅝d February-April and March-May. The sales probably reach 450 to 500 tons. On the spot sales of Tellicherry have been made at 5⅛d to 5 3/16d, and Alleppy at 5 1/16d. For arrival Tellicherry has been done at 48s 3d per cwt. c.i.f. London and 49s c.i.f. New York; also some business at 5⅜d per lb. landed terms London.

Wednesday's auctions offered only 57 bags Singapore, which found a buyer at 5¼d per lb.

The shipments of Black Pepper for the month of January compare as follows:—

	1st half.		2nd half.	
	1899.	1898.	1899.	1898.
U.K.—Sing ...	*nil*	120	50	240
„ Penang ...	70	10	*nil*	*nil*
Continent ...	50	200	40	370
United States ...	100	60	*nil*	200
Total tons ...	220	390	90	810

White has been in active demand, and is dearer—fair to good fair Singapore on the spot sold at 8¾d to 8⅞d; February-April shipment at 8 13/16d to 8 15/16d, March-May at 8 11/16d to 9d, fair Penang on the spot at 7¾d up to 7 15/16d; December-February shipment at 8d, January-March at 8d to 8 1/16d, February-April at 8 3/16d, and March-May at 8 3/16d to 8¼d; Siam on the spot at 8¾d. About 300 tons sold.

At public sale on the 1st inst. of 34 cases 243 bags Singapore brought forward, 40 bags sold at 8¾d for dull brownish, 58 bags fair Penang realised 7⅞d. 7 bags Ceylon withdrawn.

The shipments of White Pepper for the month of January compare as follows:—

	1st half.		2nd half.	
	1899.	1898.	1899.	1898.

GINGER.

Cochin.—Last week's activity has somewhat abated, but still a good trade has passed privately since our last. Medium and small washed rough has changed hands at 26s to 28s 6d and brown rough sorts at 26s to 28s. At auction 44 cases 914 bags were offered, of which 28 cases 200 bags sold—medium cut (B) rather dullish 63s, small and medium roughly cut 36s 6d, good medium and small washed rough new crop (quality preferable to last week's consignment) 29s 6d, limed rough 25s "subject," fair cuttings 20s, and dull dusty ditto 15s per cwt.

Japan.—140 bags offered but only 19 bags sea damaged sold at 19s per cwt.

Jamaica.—169 barrels, &c., all passed the hammer unsold.

INDIA RUBBER.

Further very large sales have been made at improved prices, including the following:—Fine Bolivian and old Madeira up to 4s 4½, hard fine spot and forward at 4s 3d, soft fine at 4s 2½d, scrappy negrohead at 3s 8¼d, Island ditto 2s 11½d; but the last two days there has been pressure to sell and fine is offering, spot and forward at 4s 2d, with little enquiry

In auction to-day a slow demand; the particulars are as under:—

Para and Peruvian.—80 packages retired.

Mattogrosso.—Virgin held too high. 818 packages offered and 140 packages ordinary to good negroheads sold at 3s 2d to 3s 3½d.

Columbian sells at high prices. 76 bags offered and 36 sold. fair scrap and sheet at 3s 7d to 3s 7¼d, middling at 3s 4d to 3s 5½d.

Central American, Carthagena, &c., held too high. 240 packages offered and 40 sold, virgin scrap 3s 3¼d, slab, &c., 2s 8d to 2s 10d, Mexican tarry slab 2s 3½d.

Madagascar.—16 packages sold at fairly firm rates, fair pinky at 3s 1d, inferior ditto 2s 9d, fair East Coast niggers 2s 6¼d, common ditto 1s 3d, black coated fair slightly mixed 2s 2d per lb.

Mozambique.—291 bags offered and 41 sold at full prices, middling to fair ball mixed at 3s 4d to 3s 5¼d, ordinary to good niggers and marbles at 2s 9¾, Lamu ball dirty at 3s per lb.

African (at Liverpool).—A strong demand practically cleared our market at the end of last week of all offering at current rates, and an advance since paid varying from ½d to 1½d per lb., closing firm with little offering at the higher range of prices. We estimate that fully 500 tons have changed hands during the week, including Liverpool pressed Rubber and forward deliveries.

Movements of Tea in United Kingdom from 1st June to 31st Dec., as shown by Custom House Returns.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 10th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Please note the change of address.

Coorg.

Polli Betta, 28*th Feb. Weather.*—Cloudy during the last few days. Heavy mists from midnight till morning early part of week. *Crop.*—Stripping and gleaning continuously of the old crop. Blossom opened and set under a clear sky. Pruning is making good progress. *Interesting item.* First Camp of Instruction to be held in S. Coorg from 27th March to 1st April. Inspection of Volunteers on last date.

Lower Pulneys.

Dindigul, 2*nd March*— *Weather.*—Had a very good N. E. monsoon, but no rain since 1st January. *Crops.*—Picking still going on, on most estates. Out-turn fair, and coffee promises well for next season. Weeding, and other works well in hand. *Labour.*—Has been sufficient for all requirements during 1898 and there is a large surplus always available to meet any extra work that may be taken in hand. You are wrong Mr. Editor in stating (in P. O., 25th February "The Tamil Labourer") that there is a scarcity of labour on the Pulneys. We can afford to see the Straits and Ceylon planters tap the Madura District, and still feel that there would be ample coolies left to meet our wants. *Health.*—A little fever—but on the whole good.

THE CRUSADE AGAINST ADULTERATION.

There is much that is of interest in the many reports that reach us concerning the crusade against Adulteration in Great Britain, and one lesson that impresses itself upon us is that coffee-planters in India cannot hope to succeed in their efforts to stop adulteration of coffee if they continue to conduct a little campaign of their own. The experience of grocers in Great Britain is instructive. Each important town or district has its Grocers' Association; these again form a Federation of Grocers' Associations. This Federated Association has a Parliamentary Committee and is in every respect conducted according to a well planned system. It is an organized head-quarters staff of an organized army; and it has long fought a good fight against adulteration. Yet it has to fight still. True, it has won some victories. It seeks to eradicate many malpractices; it has partly removed some, and it still wages war against others. True, also, coffee-planters have been called upon to fight only against the adulteration of coffee. They have the advantage of concentration of purpose and of forces upon one point. But what is this compared with the advantage of systematic organization, of influence extending to every corner of the country, and reaching upwards to the highest ranks, downwards to almost the lowest classes. permeating the powerful middle-class, and gaining strength yearly with the extension of education? If grocers in England fail, planters in India will assurdly not succeed; but the question suggests itself, are not the aims of planters and grocers alike in so far as coffee is concerned? We take it that both aim, if not at absolute purity, at least at having every packet offered to the public so marked as to show exactly what is being put before them.

The Federated Association issued in January last a manifesto to all the affiliated Associations urging them to bring the matter of forthcoming legislation regarding adulteration before the whole of their members and members of the trade outside their Associations, with a view to prompt action being taken. This manifesto is interesting even from the point of view of the coffee-planter, though it embraces a great number of products and covers much ground that need not be travelled over here. The gist of the whole manifesto is as follows: For seven years the Federation has persistently urged upon the Government of the day the necessity for a speedy amendment of the Sale of Food and Drugs Act (1878 and 1879). The lines upon which the Federation has recommended that such amendments should proceed have been in the direction of—to quote the words of the Select Committee's report of 1896—"avoiding the appearance of harassing traders by what may be regarded as attempts to manufacture cases of violation of the law." The appointment of various Select Committees is referred to, and attention called to the various abortive attempts that have been made to carry out legislative measures on the lines suggested by these Committees, especially that of 1896. It was lately announced that a Bill on Agriculture will be introduced into Parliament during the present session by the President of the Board of Agriculture. The Federation deduces from this that it is intended to legislate on wrong lines, by providing that the adulteration of agricultural and horticutural products shall be dealt with by one Government department and the adulteration of other foods by another Government department. The special amendments of the Sale of Food and Drugs Acts that are now urged are as follows: (1) To provide that an invoice be a sufficient warranty. (2) To provide that where the sale of an adulterated article has been made by the fault or error of an assistant, there shall be power to bring him before the Court as the actual offender, the employer in such cases to be exempt on proof that the sale was made without his knowledge or connivance. (3) To make it compulsory on the Justices of the Court, at the request of either party, to refer articles for analysis to the Somerset House authorities, which course is at present discretionary. (4) To provide a proper limit as to the time when summonses shall be issued for all articles, besides merely perishable goods as now provided, and to extend the time to fourteen days instead of seven, as at present). (5) To provide that the use of the word "margarine" be a sufficient protection against conviction for the sale of butter mixtures, or to provide that all prosecutions for the sale of such mixtures be taken under the Margarine Act, and not under the Sale of Food and Drugs Acts. (6) To provide that a copy of the analyst's certificate shall accompany the summons. (7) To provide for proceedings being taken against a person or firm giving a warranty where any such warranty is pleaded in defence to proceedings. (8 To provide such an improved system of inspection as will cause the law to be more efficiently aud systematically administered in all districts. (9) That in connection with the sale of mixed articles the vendor should supply the purchaser with a label setting forth that the article is mixed. (10) To enlarge the powers of Somerset House so as to constitute that institution a Scientific Court of Appeal, rather than set up an entirely new authority. (11) To make compulsory a division of the sample (taken for analysis or as a basis for a prosecution) after purchase and delivery of a portion to the vendor. (12) That retailers should be empowered to refuse to sell a manufactured article otherwise than in the original unopened labelled tin or packet. (13) That the certificate of any public analyst put forward by a defendant should be *primâ facie* evidence without the appearance of the said public analyst, just as the certificate of the public analyst put in by the prosecution is accepted by the Court under Section 21 of the 1875 Sale of Food and Drugs Act. (14) That provision should be made for the examination of candidates for the post of public analyst, in order that only thoroughly competent persons should fill such important appointments.

Section 9 of the above meets the wishes of coffee-planters, we think. The remaining sections prove that the Federation has only spoken after very mature deliberation, and has obtained a mastery of the subject under notice. The general deduction we draw from the manifesto, is that any prudent and reasonable plan for the suppression of adulteration of food stuffs will have the hearty support of grocers, as a body. Might it not be wise, therefore, for coffee-planters to try to co-operate with grocers, through the medium of the Federation referred to? There are grocers and grocers, of course; some have little influence, some a great deal. That the Federation has very great influence indeed may, we believe, be taken for granted; and working with it would probably be very advantageous to coffee-planters in India. Few of them are likely to urge that coffee should be sold *pure*, and in no other way;

for there is a strong party that believes that an admixture of chicory helps to sell coffee. All that really should be insisted upon is that the vendor should declare, by means of announcement on the label, or in some other equally effective manner, exactly what it is that he offers for sale. If a provision to this effect is agreed to by Government, it will not have reference to coffee alone. Hence the probability that co-operation with the grocers in England who are fighting for a similar cause would be a distinct advantage to the coffee interest in this country.

QUININE.

The Boom in quinine has naturally attracted a good deal of notice. By the 3rd ultimo prices had risen 15 per cent. and as much as 150,000 oz. was estimated to have changed holders in second-hand dealing in one day. After languishing at 10½*d.* sulphate became brisk at 1*s.* and very shortly sellers refused that rate, and 1/0½*d.* was paid for German, May delivery. The declarations for the Java sales of 16th ultimo had helped this movement, as it was announced that only 755 packages of *Druggist* bark and 3,734 bales of *Manufacturers'* bark, or a total of 4,489 packages, would be brought forward. The stock in first hands on January 24th consisted of 2,670 packages of Government cultured bark and 5,204 packages of private cultured bark, making a total of 7,874 packages, including what will be put up at the above-mentioned auction. The Java shipments of bark for January were very low being only 550,000 Amsterdam pounds, against 956,000 pounds for the same month of last year, and 390,000 pounds for the corresponding month in 1897. Prices kept firm during the next week and reached 1/1 for May delivery" The turnout for the week ending 9th ultimo was estimated at 250,000 oz. and salts other than sulphates showed a similar rise in price to that established in sulphate. The *Chemist and Druggist* observed on 9th ultimo:—"Apart from the manufacturers' movements the situation is unchanged, and the speculative transactions, allowing for the re-selling which has been going on, do not much exceed a fortnight's supply of quinine for the whole world, showing how well the manufacturers control their outlet by their policy of supplying consumers only. It is a remarkable fact that the present movement has had scarcely any influence upon the consumptive demand; there has been no rush by pharmacists for the article. The future largely depends upon the reports from Java, and if the small January shipments are repeated several times we are likely to see the German sulphate 1*s.* 3*d.* per oz. Consumption of quinine has been keeping pace with the output of bark, and the stocks of both articles are comparatively small."

THE CONSUMPTION OF COFFEE

There is "food for thought" for Indian coffee planters in remarks made by Mr. R. E. Johnston in a letter to the London *Grocer*. Mr Johnston, after noting that the Board of Trade Returns show that the amount of coffee taken for consumption in the United Kingdom during the last three years has been as follows, *viz.*:—In 1898, 12,540 tons; 1897, 12,424 tons; 1896, 12,400 tons, remarks:—"About forty years ago the figures were:—In 1861, 15,792 tons; 1860, 15,926 tons; 1859, 15,398 tons. The population of the United Kingdom has increased from 29,070,000 in 1861 to 39,824,000 in 1897 (according to the Registrar-General's estimates) Thus, in 1861 the consumption of coffee in the United Kingdom was equal to $1\frac{21}{100}$ths of a pound per head, whilst by 1897 it had fallen to $\frac{79}{100}$ths of a pound per head." He then proceeds:—"It is not unnatural that those who are interested in the coffee trade should try to find out the cause of such a remarkable decrease. We know that the production of coffee has increased very much, and I am informed that, in consequence of the low range of prices, which this increase has led to, pure roasted coffee is now being retailed in Germany (where the duty is rather higher than it is in the United Kingdom) at the equivalent of 9*d.* a pound. Perhaps some of your readers may be able to tell us the lowest price per lb. at which pure roasted coffee can be bought by the consumer in this country. I see that the deliveries of Brazil coffee (the cheapest coffee produced) for home consumption from the Port of London were—in 1898, 1,062 tons; 1897, 1,500 tons; 1896, 1,350 tons. It would be interesting to know at how many grocers' shops a buyer could get a pound of Brazil coffee if he were to ask for it. No doubt the low price of tea has affected the demand for coffee, but I cannot help thinking also that the home trade in coffee is being throttled by high retail prices and by the sale of mixtures instead of pure coffee."

No mention is made of the competition of cocoa, and here, we think, Mr. Johnston overlooks a very important point. What we specially wish to note, however, is the remarks about the retail prices of coffee. We have given one or two *American* quotations of late, which show that coffee is retailed in the States at much lower prices than in England. At the same time, we cannot shut our eyes to the probability that if lowness of price be resorted to as a means of stimulating the consumption of coffee, India will gain very little—if, indeed, she does not lose—and Brazil and other producers of 'cheap' coffee will score all the tricks.

THE USE OF FERTILIZERS.

So much has been written from time to time concerning natural and artificial fertilizers that further remarks must necessitate iteration, and some readers may be apt to turn away saying, "Oh, we have read all that before!" Nevertheless, iteration and reiteration are not faults when they relate to matters of this kind. We place a few nails, and drive them well home by steady hammering. Then they become really useful. For instance, the objects of using fertilizers have to be borne in mind. In fertilizing fruit trees the chief aim, after the tree is well developed, is to fertilize so as to produce the greatest amount of fruit, the leaves and wood then being of secondary consideration. The kinds of elements to be supplied to the soil are those which each particular soil does not supply in itself. The three most important elements are nitrogen, phosphoric acid and potash. Of these, phosphoric acid and potash, being mineral elements, are the most valuable in fruit growing. They have a more direct effect upon the fruit. Nitrogen must be used as well, but caution must be exercised in applying it, as it tends to the development of the branches and foliage. It is a popular opinion

that in applying nitrogen the foliage and stems are affected almost entirely. Phosphoric acid has to do with the production of fruit and more particularly seeds. Potash is especially useful in the development of the small twigs and the transfer of the plant food from one part of the plant to the other. This popular opinion is partly true and partly false. The whole question is simply to get the proper proportion of fertilizers. Premature ripening may not be due to an over-abundance of one constituent, but rather the absence of others. A splendid fruit or seed cannot be obtained by simply applying phosphoric acid alone, nitrogen and potash must also be used in proper proportions ; hence, the whole problem of judicious fertilizing comes back to the matter of the proper mixing of these three essential elements.

The above remarks are based on statements made by Prof. Voorhees, one of the greatest authorities on the subject ; and the following formulæ, though specially intended for use in the cultivation of peaches, may offer a useful practical basis of experiment for some of our readers. No. 1.—On lands that are infertile the following basic formula may be used. One part ground bone, one part muriate of potash, one part acid phosphate. One thousand pounds per acre is the proper amount to use in a peach orchard. No. 2.—A formula which may be used in applying fertilizers to moderately rich lands is the following : One and one-half parts ground bone, 1½ parts muriate potash. Nitrogen in some quick-acting form can then be applied as needed. For an ordinary orchard, 150 to 250 lbs. of sodium nitrate per acre is sufficient. The larger amount is ordinarily better than the smaller, but it must be used with judgment. Small fruits require larger amounts of fertilizer than tree fruits, in that from a small bush the weight of fruit obtained from year to year is much greater in proportion than that secured from large trees. The main point is to get the manure well mixed with the soil. Prof. Voorhees prefers ploughing it under to a depth of four or five inches to harrowing it in. Of course, however, the judgment of the grower must be chiefly relied upon in fertilizing. It is for him to find out just what the tree needs, and to apply it in quantities that seem to give the best results.

RUBBER.

The following information, from Trinidad, should be of interest and, allowing for climatic and other differences, may serve a useful purpose as a guide for planters who wish to experiment with rubber cultivation in these parts. Rubber-producing plants have been in cultivation in Trinidad for many years, so what is stated may be regarded as the fruit of considerable experience. The report before us says :—

Ficus elastica, or East Indian rubber, grows freely, and soon extends over a large area of ground, especially if helped by protecting its aerial roots, enabling them to reach the ground. One method of protection is to procure large bamboo stems, and after driving a hole through the joints with an iron rod, to place them beneath where the aerial roots have made their appearance, planting them firmly in the ground. After having inserted the root, the top part is loosely closed with a little moss or fibre. Treated in this way, roots reach the ground in the space of a few months, and grow so rapidly that the protective bamboo is burst away, and the root remains large enough and strong enough to afford support to the branch from which it sprung. This practice has been found very useful where support is desired for overhanging branches, in several other species of *Ficus*, notably *Ficus Benjaminia*, which is now showing as quite a "Banyan" by these means. I may mention, however, that the word "Banyan" is usually allotted to trees of *Ficus Indica*. *Ficus elastica* is a good rubber-producer, although it does not yield well until of large size. Several other kinds of rubber are grown, the following being a list of the species cultivated :—

1. India Rubber.—Ficus elastica.
2. Para or Brazilian Rubber.—Hevea brasiliensis.
3. Ceará or Brazilian Rubber.—Manihot Glaziovii.
4. Demerara Rubber.—Hevea Spruceii and H pauciflora.
5. African Rubber.—Kicksia africana.
6. „ „ . Tabornamontana crassa.
7. West African Rubber.—Landolphia species.
8. Central American Rubber.—Castilloa elastica.

Of these, according to our experience, the most suitable for growth in Trinidad is *Castilloa Elastica*. Trees in the Gardens are over 60 feet in height, and from these we have now annual supplies of well ripened seed.

Castilloa is a tree that—in Trinidad—grows quickly, and, if in good land, may be expected to be large enough for bleeding in seven or eight years. The grower, however, must take great care in early bleeding not to exhaust his trees. At the Royal Botanic Gardens trees eight years of age yield a large quantity of *latex* or milk, and experiments are now being carried on to enable us to say with accuracy what trees of a given age should produce. It has recently been ascertained that the Rubber of *Castilloa* can be readily separated from the *latex* by a mechanical process, very cheaply, and producing rubber of the best quality. By this process the rubber is separated from the water, albumenoids proteids, etc. very quickly, and never becomes foul as is the case with rubbers produced by coagulation, and therefore, may always be expected to make the best price in the market. An expert who has visited the Ceará rubber district of Brazil, states that *Hevea* and *Ceara latex* will not yield up its rubber by the mechanical process mentioned. This is a fact worthy of note in favour of planting *Castilloa*, especially as the difference of price between the best qualities of Pará and Central American rubber is merely nominal. Some of the advantages of planting *Castilloa* may be here enumerated :—

1. It takes but few years before obtaining returns.
2. It is easily tapped, and the *latex* is given in good quantity.
3. The rubber can be obtained by mechanical means.
4. The rubber is of the finest quality.

It is further estimated that trees will yield, according to size and age, from two to six or eight pounds of rubber per annum, and when this is valued, as it now is, at rates over three shillings per pound, it is not hard to see that a paying industry will result.

Of *Kicksia africana* it is as yet too soon to speak definitely, as we have only seedlings a little more than a year old. These, however, give promise of a rapid growth, more rapid indeed than that of any other rubber-producing trees.

Ceará rubber, the produce of *Manihot Glaziovii*, does not do well in Trinidad so far as has been seen, and previous experience of it in Jamaica strengthens our belief that it is not be compared to *Castilloa* for cultivation in our climate.

Tabornamontana Crassa grows freely, and keeps in excellent health, and we are shortly to try what class of rubber it will yield as grown here.

Landolphia Species is growing in the Garden, but it takes many years to attain a size to be worth while tapping.

for rubber. One vine of it is to be seen climbing a tree in the grounds to the height of some thirty feet, and yet the thickness of the stem is only more than an inch in diameter. Rubber of excellent quality can however be made direct from the stems without any further preparation than rolling the first portion of the quickly coagulating juice in the wound from which it is taken, thus forming it quickly into balls of rubber. This rubber has been reported on as a fine quality.

The *Heveas*, or Brazilian and Demerara rubbers, are trees of large size, and do not bleed so freely as *Castilloa*, neither do they grow so quickly, but they have the advantage of being able to grow in places where *Castilloa* could not thrive. Trees of large size are present in the Garden, and annually give seed in limited quantities.

The list of rubbers would not be complete if we did not mention the indigenous *Mimusops Globosa*, the "Balata;" from which the very hard rubber of balata gum is extracted. These trees are quite common in our forest lands, and from these and from private lands, a large quantity is annually exported. Large quantities of Balata also pass Trinidad in transit from mainland to ports. The tree itself is a very valuable hard wood, and is invaluable for railway sleepers, and also for any position where a moisture-resisting wood is required. Latest advices from Europe show that there is a prospect of being able to obtain annual crops of *Castilloa*. It has been found from experiment that small stems of one year's growth contain as much as seven or eight per cent. of their dry rate of good rubber; that amount having been extracted from material grown in Trinidad. If this experiment can be worked out on a large scale, it is not hard to imagine a field of *Castilloa* reaped annually, and large factories for manufacture of the crop. The *latex* of our rubber trees (*Castilloa*) has been proved by careful experiment to give twenty-five per cent. of its weight, in pure and clear rubber.

NOTES.

Duties and Taxes on China Tea. The Canton duties and taxes on tea are said to amount to as much as 35 per cent. of the cost price.

Coffee in Panama. The crop of 1897 exceeded that of 1896 by 38 per cent. 814,504 bags coffee, 127,676 bags Coca and 1,623 bales Coca were transported over the Panama Railroad during the year.

Calcutta Tea Sales. The average price realised at the last "Calcutta Tea Sales" was 5 as. 4 pies. Only one more sale will be held before the close of the season. The date of this has not yet been fixed.

Coffee in New Caledonia. Production appears to be on the increase and great care is now being taken in curing. New Caledonia coffee is said to bear a good reputation in France, where it is classed by experts as approaching the Mocha berry in size and aroma.

Eucalyptus Globulus. Attention has lately been called to a fine specimen of the *Eucalyptus Globulus* growing at Torquay. It is 20 years old and 50 feet high; the spreading circumference of the trunk at the base is 3½ feet.

Cinnamon Sales in London. The first quarterly auctions of the spice in Mincing Lane took place on 27th ultimo when 1,700 bales were sold. A dull tone prevailed at the sale and prices fell a half-penny to 1*d*. per lb., as compared with the November auctions.

A new Tea-drying Machine. A new tea-drying machine, invented by Mr. Bett, is to be tried shortly at his estate at Strathlay, Ceylon. The object of the machine is said to be more particularly to improve the quality of tea and save fuel.

Blotting pads. We have to acknowledge receipt from Messrs. Martin and Co., Calcutta, Agents for Mr. Arthur Koppel, of two blotting pads, with celluloid covers, and of a catalogue of Mr. Koppel's portable and permanent railway materials.

The "Agricultural Ledger." The latest numbers published treat of "The Breeds of Cattle in the Central Provinces" and "Indigofera Sp." (Wild Indigo)—"Wild Indigo Seed as a Famine Food in Bombay and Berar."

Agriculture in France. In 1895 there were 1,615,061 hives of bees in France, producing 17,629,636 lbs. of honey of an average value of 6*d*. per lb., and 4,869,301 lbs. of wax of an average value of 9½*d*. per lb. £440,000 for honey and £1,800,000 for wax is enough to show that there is "something in" Agriculture.

Caste Prejudice. The *I. P. G.* has been informed by a very intelligent native that so long as caste prevails in India, tea manufactured by Europeans will never become a popular beverage with the great mass of the people. Orthodox Hindus, he asserts, will not use tea, because it has been contaminated by the touch of *Mlechas*.

"Salvation in Tea." With reference to the note we lately published under this heading, it is but fair to state that the Editor of the *Methodist Recorder* had explained that the case was an isolated one of pure philanthropy, and that the object of what was done was to attract attention to an unfortunate man in search of a situation. which he has now obtained.

Electric Tea Drying. Messrs. Finlay, Muir and Co. have tried the experiment on one of their

tea gardens, Rungamutti, in the Dooars, of having a large electric plant fitted up for electric tea-drying. It is purely an experimental departure, and the result of the trial of this new method will be looked for with great interest by all concerned in this industry.

Coca in Bolivia. The finest coca leaves to be obtained in South America come from "the garden of Bolivia," the Yangas district The Bolivian Indian is a great consumer of this produce, which is to him a necessary of life. The annual production is said to amount in value to about 3,000,000 dollars, and the export trade is increasing.

Mr. H. O. Newport in Queensland. The *Cairns Argus* of 27th January 1899 observes :—Mr. A. J. Draper has been notified by wire that Mr. Newport, the instructor in coffee culture, left Brisbane by the S.S. "Wodonga" yesterday for Cooktown. He will call at Cairns and give advice to anyone requiring it. It is possible that he may arrive at Cairns by the boat following the "Wodonga."

Java Quinine. Referring to a recent statement that most of the London deliveries of Java quinine have been re-shipped to the United States, Messrs. Brookes and Green, the brokers through whose hands it all passes, state that the report is quite groundless, and that, as a matter of fact, not five per cent. of the parcels landed in London have been re-shipped. It is taken by English buyers for English consumption.

Attar of Roses. Dietze proposed the following standards of purity for oil of roses : (1) Specific gravity at 15° should not exceed ·870. (2) Solidification point should be from 15°-20°. (3) The rotatory power should not exceed 1° 30′. The saponification number should not exceed 10, and the ratio of acid and ester number should not exceed seven. Raikow now states that these tests do not guard against adulteration with oil of geranium.

The London Tea Market. Cabling to Colombo on 23rd ultimo, Messrs. Gow, Wilson and Stanton reported a steady market, Pekoes for price dearer. Pekoe Souchong 7½*d*. (½*d*. up) and the average for the week on garden account 8¾*d*. (¼*d*. up). Reuter reported that common sorts of Ceylon were in particular request and that 14,000 packages were sold out of 15,000 offered. Of Indian teas 40,000 packages were sold out 42,000 offered ; average 9½*d*. (¼*d*. up).

Good for Ceylon Tea. The recent fire at Melbourne appears to have had a very stimulating influence on the Ceylon Tea market. At any rate, large purchases have been made there of late, though opinions differ as to what share Australia has taken in the buying. There has certainly been a brisk inquiry for Russia, and since the last auctions brokers have been offering sellers an advance of 3 to 5 cents per pound on the prices then realised. Pekoe and Pekoe Souchong were in chief request.

Ceara Rubber in India. With reference to our recent comment on Mr. David Hooper's report on this subject, the *Times of Ceylon* observes :—"We think, with *Planting Opinion*, that this is a sweeping statement to make from a very limited experiment. There may be localities in India where rubber trees with the necessary properties could be grown as easily as in Ceylon, and, in fact, we know that Assam already exports rubber the quotations for which appear in London circulars."

Coffee-disease in Mexico. In many localities in Mexico coffee-trees are attacked by an insect of the genus *dactylopius*, known in some parts as the 'mealy-bug.' In some places, diseased trees are simply cut down and replaced by others, whilst some planters use a petroleum and soap insecticide. The disease is worse in wet seasons, spreads from tree to tree, and threatens, if neglected, to become a serious matter. At present it does not seem to have raised much alarm among planters.

Old Tea in Ceylon. Mr. C. Spearman Armstrong, one of the pioneers of Tea in Ceylon, informs the *Ceylon Observer* that his 23-year old tea fields in Maturatta have continued, without manure, to give as good crops now as fifteen years ago, namely, an average of 600 to 700 lb. per acre. Mr. Armstrong has seen nothing of blights in his own high district, though he has heard a good deal of them elsewhere. He agrees, however, that probably Ceylon is approaching its maximum crop of tea,—that future crops may run between 120 and 130 million lb. averaging about 125 millions.

Science in Farming. In the 1899 edition of "Vinton's Agricultural Almanac," Professor Wrightson observes that the farmer's duty is not the discovery or elucidation of the secrets of science, but the application of such forms of it as may be adaptable to the management of and the feeding of stock. Infinitely more important and useful to the farmer is a thorough understanding of the practical rules and conditions which govern the productive capabilities of the soil than a hard grounding in chemistry or botany. The latter he may succeed without, as many noted agriculturists have done before him, but the former is indispensable, and will remain so.

Cross-breeding. A Conference on Hybridisation is to be held next July under the auspices of the Royal Horticultural Society. *Apropos* of this, the *Gardener's Chronicle* remarks :—"Varieties and species and genera only differ in degree one from another, and the limitation of the groups in question is very much a subject of personal judgment. Hence the terms 'cross-breeding' and 'hybridisation' are often used indiscriminately, though, as a rule, the first term applies to the intercrossing of varieties, the second to that of species. When the cross is effected between species belonging to what are considered two genera, the result is a bigener or bigeneric hybrid." Some hybrids are natural, others artificial."

Plants of Commerce Classified. It is an interesting thing to know, says *Science News*, that 4,200 species of plants are gathered and used for commercial purposes in Europe. Of these 420 have a perfume that is pleasing, and enter largely into the manufacture of scents, soaps and sachets. There are more species of white flowers gathered than of any other colour—1,124. Of these 187 have an agreeable scent, an extraordinarily large propor-

tion. Next in order come yellow blossoms, with 951, 71 of them being perfumed. Red flowers number 823, of which 84 are scented. The blue flowers are of 594 varieties, 34 of which are perfumed, and the violet blossoms number 308, 13 of which are pleasantly odoriferous.

Congo State Coffee. The shipment of coffee of poor quality despatched to Antwerp from the Congo Free State last January has now been followed by a further shipment, which experts declare to be a considerable improvement over the previous samples tested at the beginning of the year. The Congo coffee, whilst resembling the Ambriz product cultivated in the Portuguese colonies in Africa, is said to be far superior to it. It has a pleasant although somewhat unusual taste, and by admixture will facilitate the burning process of other and better qualities of berry where the flavour is not affected The tests made show generally that considerable progress has been made in the method of cultivation and treatment of the coffee raised near Stanley Falls.

The London Tea Auctions. The Indian Tea Association lately suggested the substitution of eighths in place of farthings in bidding for teas under 6½ per lb. and the innovation that the selling broker's bid should rank first and before all others. The Ceylon Tea and Produce Committee has rejected the proposal, though the first part of it was unquestionably wise. It *must* check competition when a man is compelled to raise his limit not less than 4 per cent at a time! In times of very brisk demand men may boldly "take the leap," but under normal conditions, and during depression for one that will do so there will be ten that hold back. "Competition made easy" should be the watchword of those that wish to improve the London Public Sales.

London Advices. It will be seen from our Market Report this week that up to the 10th ultimo Plantation Ceylon, and all fine qualities of coffee, continued to realise very fair prices, while medium and low descriptions were difficult to sell. Cocoa at the auctions sold occasionally rather dearer. Indian Tea met with considerable competition at the auctions, the demand being particularly active for common to medium whole-leaf kinds, which, up to 7½*d.* per lb., frequently shewed a further fractional advance; medium Broken Pekoes ruled rather irregularly and generally offered good value to the buyer. Travancore commanded a strong market. Ceylon Tea also went well, except Broken Orange Pekoes, which were somewhat neglected and rather easier. The Spice market was generally steady. Black Pepper was firm on the spot, but easier for arrival.

Heat and Sex in Plants. It is not generally known that heat exercises an influence in determining the sex of plants, but one scientist says it does. In the "Comptes Rendus of the Academy of Science" for 31st October, M. Marin Molliard contributes a paper on the "influence of temperature in the determination of sex," detailing experiments conducted principally with Mercurialis annua, cultivated under varying conditions. Briefly, his conclusions are that, in Mercurialis, heat (as in the vegetable marrow) favours the production of female plants. The action of the heat exerts an influence upon the seeds in which it is to be supposed that the sex is definitely formed, and subsequently favours the germination of female seeds; or it even may act further in determining the sex when the seed is formed. The author adopts the second theory, which alone explains the modifications of sex previously detailed in the case of hemp. As he does not appear to say anything about animals, human or otherwise, we must assume that he considers that Nature has entirely distinct sexual laws for animals and plants. There are great possibilities in the suggestion.

Spencer & Co.'s Cigars. Messrs. Spencer and Co., Limited, have favored us with sample boxes of some of the cigars they exhibited at the Agri-Horticultural Show held here last Saturday. Their stall is a feature of this annual exhibition, the "flor de Spencer," and "flor de Sumatra" coming in not inappropriately at a flower-show. No prizes were offered for tobacco or cigars this year, otherwise the above firm might have added to its collection of medals, which already includes 4 gold and 7 silver testimonials to the excellence of their cigars. The Madras flower-show would be incomplete now-a-days without Spencer's cheroot stall, which is usually the great centre of attraction; and indeed, the Company has made itself and its oilmanstore's and its wines and its cheroots—not to speak of its palatial business premises—a veritable part of Madras. Light one of Spencer's cheroots—the smoke ascends and spreads. Glance at the records of their business—the figures rise higher and higher, and the goods spread farther and farther throughout the Presidency and beyond.

Natal Tea. A correspondent of the *Chemist and Druggist* writes that it is about fifteen years since tea-planting was started in Natal, Mr. W. R. Hindson, of the Clifton Tea Estate, being one of the pioneers. The twenty-five acres he commenced with have grown to over 600 acres. Hindoos and their families are the workers employed. The picking season commences generally early in September, and goes on till about the end of the following May. The months of June, July and August are taken up with digging and manuring the land and pruning the plants. The tea is picked by the coolies, mule-carts in different gangs collecting the leaf. Last year's output of tea from the estates was estimated at from 300,000 to 400,000 pounds, for which there is a ready market; and as there are other estates which bring up the total under tea-culture to between 2,500 to 3,000 acres, the year's output of tea may be put down at 1,000,000 lb. at least The industry is a growing one. Our contemporary reports that the samples of Natal Tea submitted with the above letter are of good flavour, "but the teas give a poor liquor with London water, and would only be good here for blending purposes." The leaf is of about an average size.

Bounteous Queen Tea. A home correspondent writes:—"I noticed in Aberdare the other day that a certain tea company were adopting a very attractive and up-to-date way of advertising the grocers who had taken their agency for tea, with real Indians in their native costumes, which were very effective, and caused great attraction in the neighbourhood. I think the system they have of giving purchasers a cheque with a quarter of a pound of tea and upwards, which they can save for expensive and useful articles, is quite a boon to the working-classes, and tends to keep the grocer's trade together, as one customer tells her neighbour what wonderful presents she gets from her grocer.

which is the best advertisement any grocer can possibly get." This view is shared by a grocer, who states that being confronted with a present-giving shop, he soon found out he had got to follow suit or lose a certain portion of his tea custom, viz., the Saturday night working man's wife. He chose the former, and decided to give presents, adopting a fancy name for the tea, made a good display, advertised it with handbills every Saturday morning, and is pleased to say it has caught on ; it shows a good profit, and is a constant attraction to his window, whilst his provision window cannot be passed unnoticed by the public.

Sylhet Coffee. The *Planter* publishes a contributed paper on this subject. The writer assumes that the question of suitability of soil and climate has been demonstrated in South Sylhet, and the survival of bushes in the second growth, on the tilas near Silcoorie in Cachar, long after the demise of Mr. DeFouche, evidences that the land in the middle of the Barak Valley is equally fitted for raising the bean, while in Lower Assam the rainfall and other conditions indicate that coffee would thrive in four districts of Goalpara, Kamrup, Darrang, and Naugong, though the terais of those parts might prove too wet. He seems to think that coffee would "pay" if it realised only 70*s.* per cwt. in London, and after going into figures very sketchily, remarks :—"Sufficient has been written to show that under present circumstances coffee offers more inducement than tea ; for although for prudence sake we have taken ruling prices for comparison, fine plucking, depletion of stocks, increased consumption, etc., may bring about a rise in the markets for tea, the figures we have given of the value of the two indicate that the gap is a wide one which could only be closed by the latter attaining the auction realisations of five and twenty years ago, which, of course, is outside the pale of probabilities."

The Perfume Industry in Southern France. In a late number of the *Revue de Statisques* there is an interesting collection of facts concerning the perfume industry in the department of the Maritime Alps in Southern France. The quantity of blossoms required annually for the manufacture of perfumes, oil, &c., is : Of roses, 2,000,000 kilograms (4,409,200 pounds) ; of orange blossoms, 2,500,000 kilograms (5,511,500 pounds) ; of jessamine, 200,000 kilograms (440,920 pounds) ; of cassia blossoms, 150,000 kilograms (330,690 pounds) ; and the same weight of tuberose ; and 200,000 kilograms (440,920 pounds) of violets. The average prices paid for a kilogram (22,046 pounds) of blossoms are 4 francs (77·2 cents) for violet and cassia, 5 francs (96·5 cents) for tuberoses, 2½ francs (48·2 cents) for jessamine, 65 centimes (12 5 cents) for roses, and 70 centimes (13·5 cents) for orange blossoms. One violet plant will give a weight of 20 grams, or one twenty-fifth of a pound, of blossoms, and an orange tree 10 kilograms (22·046 pounds). A flower-picker could gather in four hours 20 kilograms (44·092 pounds) of roses, or 3 kilograms (6·66 pounds) of jessamine, or 6 kilograms (13·2 pounds) of tuberoses, and in a whole day 10 kilograms (22·046 pounds) of violets or orange blossoms. In order to prepare 1 kilogram (2·2046 pounds) of essence, 1,000 kilograms (2,204·6 pounds) of orange blossoms, which means approximately 1,200,000 separate flowers, are required ; and for a kilogram of attar of roses, about 16,000 kilograms (35,273·6 pounds), or 5,000,000 roses. In a single year there are produced in that district alone 500,000 kilograms (1,102,300 pounds) of pomade or oils, of which the value exceeds 15,000,000 francs ($2,895,000).

LETTERS TO THE EDITOR.

NEW PRODUCTS.

Sir,—Seeing the price of coffee below Rs.1,000 a ton, I do not think it would be out of place to go fully into the methods of planting a more profitable product than coffee is at the present price.

People have at different times experimented in a small way with different products, and although we hear plenty about the start and prospects of the 'new boom' we seldom hear how the experiment has ended.

Can any of your readers give any details about Attar of Roses ? I have taken great interest in the letters that appeared on the 4th and 11th instant, and should like to know, where one could get some reliable information as to the cost of planting a small patch of, say 1 acre, where to get the cuttings from, how long would the roses take to bear a paying crop, etc. etc.

R. E.

PRICES OF NILGIRI COFFEE.

Sir,—I have been much struck by the fall in prices of Nilgiri Coffee, and the great rise of Ceylon Coffee, and I am much puzzled to account for it. I find that in 1885 Ceylon bold to fine bold was 82*s.* to 103*s.* and East Indian 80*s.* to 100*s.* Now Ceylon is still 103*s.* and East Indian has apparently fallen to something like 70*s.* and Nilgiri to 60*s.*

One Planter thinks it is due to the new mode of classing coffee by its liquor, another advises more scientific curing, surely coffee has always been cured in the same way for the last forty years, as to judging by the liquor, this seems a new idea but does not account for the great fall in price of Nilgiri Coffee. I see the Adderley Estate in the Coonoor Ghat still brings prices equal to Ceylon. Can it be that it was highly manured with bone dust many years ago ? I believe many Nilgiri Estates are deficient in lime and potash—perhaps some of your readers can throw some light on the subject—one thing has struck me, that tea worth 6*d.* a pound is sent home in lead, but Coffee A. B. size worth 10*d.* a pound is sent home in bags ! !

Observer.

QUOTATIONS.

Dear Sir,—One or two things have struck me on reading your paper from time to time :

Planting Opinion, February 18, 1899.

We mostly reckon our coffee by the ton or cwt. and either say we got £70 or 70s or Rs.1,050 it being understood we mean ton or cwt. as the case may be. In your issue of the 18th instant, in the article "North Borneo as a rival," I notice the statement, that the prices are "$19 to $20 per picul of fair clean Liberian coffee." Now it strikes me, that most of your readers being Indian Planters they might like to see how much a ton this would be in pounds or rupees. I for one do not know how much the "$" mentioned is, or how much a

"picul" is. Would you mind, if you can, letting us know what the measures and monies you use now and again, mean?

Again in the Market Report of the same date, I take the prices to be per cwt., am I right? If so, the statement "New York—No. 7 Rio.....5·65 cents. what does it mean? $1·13 per ton!"

23rd February 1899. QUERY.

N.B. – The *picul* in Borneo is equivalent to 135·64 lbs. and the dollar, which fluctuates considerably in value, may, for purposes of calculation, be taken at 2*s.* 2*d.* Thus $19 to $20 per picul would represent something like 34*s.* to 35/8*d.* per cwt.

The American quotation referred to is per lb. and represents about 26*s.* per cwt., taking the dollar at 4/2*d.* Our correspondent may perhaps find it interesting to compare monthly prices c.i.f London and c.i.f. New York. The following table shows the rates at which Coffee was thus laid down in 1896:—

	c.i.f. London per cwt.	c.i.f. New York per lb.	per cwt.
January ...	61/9 ...	$12\frac{13}{16}$ ...	59·9½
February ...	62 3 ...	$12\frac{7}{8}$ ...	60·1
March ...	66 9 ...	$13\frac{13}{16}$ ...	64·5½
April ...	67 3 ...	$13\frac{15}{16}$ ...	650·½
May ...	61 0 ...	$12\frac{5}{8}$ ...	58·11
June ...	59 3 ...	$12\frac{3}{16}$ ...	56·10½
July ...	52/0 ...	$10\frac{11}{16}$ ...	49·16½
August ...	50/6 ...	$10\frac{1}{8}$ ...	47/3
September ...	47/6 ...	$9\frac{5}{8}$ ...	43/9
October ...	53 3 ...	11 ...	51/4
November ...	46/0 ...	$9\frac{3}{8}$ ...	43/9
December ...	56/3 ...	$10\frac{5}{16}$ ...	48/1½

GENERAL ARTICLES.

BRAZILIAN RUBBER.

In the course of a report on the industries of Para and district, the British Consul there deals with the rubber supply. He says:—

The northern tributaries of the Amazons do not produce much rubber. Of these, the river Negro produces the most. The quality, however, is soft. The river Branco yields very little rubber, and the upper part runs through posture lands and high ground, which is not suitable for good rubber. Some of the other northern tributaries have not been explored, and may yet reveal large stores of rubber. The "hevea" is known to exist on the banks of the Japura, but that district has not yet been opened up.

The following articles are used in the India rubber industry:—

A clay funnel, which in shape is very much like an ordinary toilet water jug without a bottom or handle. It is made of the clay that exists in most parts of the Amazons. The fuel used in the funnel consists generally of the nuts of palms.

It was at one time imagined that the excellence of Pará rubber was greatly due to this kind of fuel used in curing it. The palms that furnish this fuel were accordingly transplanted to Africa with a view to making Pará rubber there. The experiment, however, has not succeeded.

The reason why these nuts are selected in Brazil is because they emit a continuous dense smoke, and are more portable than other fuel obtainable. However, when none of the palms named are present, then bark and twigs are used as fuel.

Every man engaged in the forest carries a wood-knife. One of its uses is to cut down fuel for the preparation of rubber. The blade is about 26 in. in length and about 2 in. broad. All the knives are imported from the United States and Germany. These countries vie with one another in selling a serviceable article as attractive and cheap as possible. Owing to the damp climate the blades are electro-plated; this prevents them from getting rusty before they are sold. The handles are made of wood and are carved or inlaid with brass.

VANILLA IN THE SEYCHELLES.

Mr. Harold Baty writes to the *Ceylon Observer*:—At present things are fairly bright with us here. Our last Vanilla crop was a good one and prices at Mincing Lane still keep at a very satisfactory level. I fear, however, the crop of 1899 will not be nearly so good. The owners of low-lying estates complain that the dry weather was too prolonged. In the hills, on the other hand, we had a splendid show of buttons, and just as flowers were appearing, down came the rain steadily for two or three weeks In the islands, reports are more satisfactory. From my own island—Felicite—I hear that there is an excellent show of unusually long pods. . . . . I hear that several of your Ceylon planters think of trying their luck in Seychelles. I certainly advise caution. They should remember that the area of these islands is small, and that owing to our recent prosperity the present holders of land are not at all disposed to part with their properties except at high rates. Ten years ago any hard-working young fellow possessed of £ 1,000 could have started here with very fair chances of success; but now I could not advise any one with less than £,3000 to come here.

The administrator of the Seychelles writes to the *Journal of the Imperial Institute*:—A vanilla plantation should not be started in the Seychelles with a capital under £1,000, seeing that it takes three years to produce a crop. Suitable land cannot be secured under Rs.200 an acre, and even at this price it is not easily obtainable. Under the old system (planting on bars, wires, etc.) from 1,200 to 1,300 vines were planted per acre. The vines are now planted on live trees, and the number planted depends on the number of trees existing on the land to be put under cultivation. The vines cost about Rs. 4 per 100. and a man can plant 350 cuttings of vines per day, and can keep in good order, throughout the year, 2,500 plants. A man's wages are Rs.12, and a woman's Rs.6 to Rs 8, without rations. The women are employed for "marrying" the flowers, *i. e.*, removing the pollen from the anther of the flower and applying it to the stigma. A woman can "marry" from 600 to 800 flowers per day. Each vine can produce from 25 to 30 pods. 130 of which average 1 pound of prepared vanilla. The flowering season is from August to December, the pods are gathered about nine months after, and it takes three or four months to "cure" the pods.

GINGER.

The second attempt at raising the value of Ginger, although this time slightly supported by an improved spot demand, has not proved altogether successful, yet it has not been without some usefulness, for it has clearly demonstrated the strong undercurrent of bullish feeling existing in our market. All the old operators, and a good number of fresh outside speculators, seem ready and anxious to support any upward movement, be it artificial or otherwise. All they are waiting for is a strong hand to set the ball a-rolling, and to direct its future course. Such a hand we know exists, but, unfortunately, its actions have, so far, been seriously hampered by the firm and uncompromising attitude of the Indian markets, which, quite regardless of the European stocks of Ginger, have only an eye for the extremely favourable statistical position—from a bull's point of view—of the article in India. Last season, owing to the prevalence of the Plague in Bombay, Europe, particularly London, was the only outlet for their Ginger, and every ounce of stuff grown found its way to our ports, with the result that India became absolutely bare of stocks. Now, India and adjoining countries are the principal consumers of Ginger, and when, this season, the hope of a good crop became doubtful, and when, later on, it became evident that all over India an unsatisfactory yield would be gathered, Native dealers and speculators rushed into the Bazaars to secure as large a portion of the small crops as possible. A wild speculative movement, particularly in rough descriptions, these being the most congenial to Indian taste, immediately resulted and has been maintained up to the present day. Prices rose quickly to a level much above London parity, and Europe had practically to sit still and look on. At the time of writing Cochin washed fetches readily parity of 29s c. i. f. London in India, whereas 26s. c. i. f. is paid for Calicut rough unassorted, and 28s. 9d. c. i. f. for usual cut assortment. These are prices above the equivalent of the London landed parity. It is foolish to think that purchases at these figures are being made by Native dealers with the sole object of shipping them to London on consignment later on. Natives know the values ruling in London, and the chances of a boom here as well as we do ourselves, and although they are often reckless in their ventures, they are cute enough to calculate a margin between purchase price and London

values before buying for consignments to our port. It is our opinion, therefore, that the bulk of the rough Ginger is destined for home consumption and for export to Arabia, Persia, etc., and that very little will find its way to London. This makes the position of Ginger all the stronger and renders the possibility of a rise here shortly all the greater, but, as we have said in a recent issue of ours, spot will have to move in order to put a bull movement on a sound footing. We may add that recent reports from India confirm the early estimates of short crops, especially in the Cochin district. —*London Commercial Record.*

MEXICAN COFFEE PRODUCTION.

Among those plants having the highest commercial value which flourish on the slopes that extend from the summit of the high plateau of Mexico down to the sea coast are cinchona and coffee The former has had some attention, but has not been cultivated in anything like the same methodical manner as coffee. The coffee tree is a plant of mild climates. It prospers in localities where the temperature is not commonly inferior to 60 or 64 deg Fahr., not frequently reaching 86, and generally keeping about 60 or 75 deg. The plant requires also a good amount of moisture in the atmosphere; this seems to constitute its life, and irrigation is therefore unnecessary. The altitudes answering to such temperatures in Mexico are those between 800 and 1,400 mètres above the lowest level.

Coffee seems to have been introduced into Mexico in the early years of the present century, and there is some reason to believe that cultivation first began in Cordoba. At any rate, it is on record that in the year 1817 the cultivation had developed in this neighbourhood to an extent which was not paralleled by the progress attained in any other quarter. This position of pre-eminence Cordoba has not been suffered to maintain; but even to-day the production ranks second only to that of Soconusco, which has the largest output of any coffee district in Mexico. This output has been achieved in face of the general belief that Soconusco is not an ideally suitable place for the cultivation of the berry. Its altitude is from 850 mètres to 900 mètres, and we believe that it is an undeniable fact that the bearing per tree is larger in the cantons of the same State, Huatusco and Coatepec, lying respectively at 1,300 mètres and 1,200 mètres altitude. The bulk of each tree is larger in these last cantons, and they are obliged to plant them at a wider distance from each other. Orizaba, at 14 miles from Cordoba and 1,200 mètres altitude, enjoys the very climate fit for coffee, and would be more advantageous than its neighbour district if the strong southern winds which blow at the very time of the blooming of the tree, carrying away the flower, had not up to now constituted a very serious check to the development of the industry. The harm, perhaps, might be averted by the planting of trees of thick foliage in a convenient position.

The figures for the output of the fiscal year 1897-98 show a substantial advance on those of 1896-97. The exports were 288,593 cwt. as against 251,826 cwt. Among the States the largest producer was Vera Cruz, with 106,484 cwt., and among the districts, Cordoba with 40,944 cwt. The figures given above are official; but in view of the extensive smuggling which goes on from Soconusco into Guatemala, they cannot be held to be quite accurate. The high price which coffee commands at intervals has, of course, not been without its effect upon the value of coffee lands in Mexico. At Cordoba they are often worth $48 an acre. Very similar prices rule in Coatepec and little inferior in Huatusco. In Oaxaca, in the good districts, the price is about $24 an acre. It is not improbable, however, that in view of the low price for the berry which now rules we shall shortly witness a considerable diminution in the number of Mexican plantations and a corresponding fall in the value of land. The present price offers no margin to planters worth talking about. It is plain, therefore, that plantations will be abandoned and the crop reduced until prices rise again. It will be remembered that fifteen years ago, under very similar circumstances, an extensive area went out of cultivation. Although Brazil practically rules the market, it is, we believe, a fact that Mexican coffee is much more appreciated than Brazilian. A Mexican authority is responsible for the statement that the lowest class of the Mexican article commands $2·50 per cwt. more than the lowest class of Brazilian.

TEA, &c., COMPANIES.

Kanapediwattie Tea Company.—The ordinary general meeting of this Company was held at Colombo on 21st ultimo to receive the Report of the Directors and the accounts to 31st December, 1898, to declare a final dividend, to elect a Director, to appoint an Auditor, and to transact any other business that may be brought before the meeting. Mr. T. N. Christie, presided. The report stated that the amount of Tea secured on Estate account was 142,267 pounds, an increase over theprevious year of 20,172 pounds, but 2,733 pounds short of the Estimate, which, considering how unfavourable the weather was, may be considered highly satisfactory. The cost laid down in Colombo was cents 20·52 as against cents 23·08 for the previous year. A further quantity of 30,330 lbs. tea was made from bought leaf, being 7,623 lbs. more than was secured the previous season. The total crop of 172.597 lbs. cost in Colombo cents 23·11 per lb. and realised a nett average price of cents 32·71, as against cents 34·38 in 1897. The nett profits for the year amount to R40,667 99, to which must be added R1,163·25 brought forward from last season. Of this sum R13,360·00 was absorbed by the payment of an interim dividend of 4 per cent. for the 6 months ended 30th June last, and the Directors now recommend that a final dividend of 5 per cent. be paid, making 9 per cent. for the year, that R11,000·00, be placed to the Reserve Fund, thus bringing it up to R15,000 00, and that the balance of R771·24 be carried forward to the next account. The nett earnings for the year are equal to over 12 per cent. on the paid-up Capital of the Company as against nearly 11 per cent. in 1897.

The Clyde Tea Estates Company, Limited.—TheAnnual Ordinary General Meeting of Shareholders of the Clyde Tea Estates Company, Ltd., was held at Colombo on the 25th ultimo Mr. F. M. Laurie in the chair. The report states.

		Acreage.	
Tea in full bearing	...	434	acres.
Young Tea ...	...	112	,,
Jungle, &c. ...	...	169	,,
	Total...	715	acres

The weather during a considerable portion of the year was unfavourable to heavy flushes. The quantity of tea made was: from Estate leaf 188,669 lbs. and from bought leaf 6,406 lbs. against estimates of 230,000 lbs. and 10,000 lbs. respectively. The yield for the year equals 434 lbs. of made tea per acre in bearing. The cost of Estate tea, including transport but exclusive of manuring, was R42,116·23, or say 22·32 cents per lb The net amount realized for the total crop (195.075 lbs.) was R65,336 69, an average of 33·50 cents per lb The expenditure on Manuring during the year (R6,079·20) has been charged against revenue, and the following additional sums have been written off:—R1.367·03 on account of preliminary Expenses. R2,870·43 for depreciation in value of buildings and Machinery at 2½ per cent and 10 per cent. respectively. The available balance is R10,982·46, from which the Directors recommend payment of a dividend of 4 per cent. absorbing R10,809·00, and leaving R182·46 to be carried forward to next account.

Tea Corporation of Ceylon.—The following is the report of the Committee of Investigation appointed at the general meeting of the Tea Corporation, Limited (of Ceylon), held on the seventh day of December, 1898 To the Shareholders.—Your Committee have most thoroughly investigated the accounts and the affairs of the Company from the date of its incorporation, and they are of opinion that since the Company have had control of the Estates, they have been most satisfactorily and economically worked, and they consider that with careful management and every economy in the working expenses, the Company will be brought round to a satisfactory paying basis

Your Committee are glad to report that Messrs. Anthony Gibbs and Sons, the Company's Agents in London, are being approached with a view to reduce their Commission under their contract until such time as the Company is able to pay a Dividend on its Ordinary Shares.

Your Committee are of opinion that the Directors should certainly have exercised more caution in taking over the Estates, and undoubtedly a great deal of time was lost before the Company actually acquired possession, and that a loss was sustained by the Company in the first six months' working in consequence thereof. This arose from the fact that the owners of some of the Estates,

during the interval that elapsed before the Company took possession, did not use the proper supervision they ought to have done in the working of their Estates, knowing, no doubt, that the Company had purchased the same.

Your Committee, however, find that the delay mainly arose by reason of the legal difficulties which took place, and for which the Directors could not be held responsible.

Your Committee are finally of opinion that the estates are now, judging from the Manager's reports, thoroughly sound, and that, provided the management is carried out, as above stated, in a careful, economical manner, and with no further rise in exchange or depreciation in the Tea Market, the Company's prospects for the future must be considered satisfactory and encouraging.

Mr. George Vanderspar, one of the Committee of Investigation who is proceeding to Ceylon has been requested, and has consented, to visit the Company's Estates and make a report to the Board, and will also see the Managing Director and the Company's Agents in Ceylon with a view of seeing if they will not consent to reduce their charges until the Company is on a more paying basis.

Your Committee have received every possible information they required, both from the Directors and the Secretary, and they have rendered them every assistance in their labours.

REG. R G. NORMAN,
Chairman of the Investigation Committee.

The Board has suggested, in order that larger shareholders should be more fully represented, and as it does not in any way increase the Directors' fees, that two of the members of your Committee of Investigation be added to the Board, and they have elected Mr. Alfred Bull and Reginald Norman (two members of your Committee, who are now thoroughly cognizant with the affairs of the Company) to serve on the Board, subject, however, to the shareholders' approval.

LIME AS A MANURE.

The following "Special" Article appears in the *I. P. G.* The properties of lime as a manure in its quick and carbonate forms are being discussed in a contemporary. Lime as a manure crops up for discussion periodically; and, as a Coorg correspondent remarks, the effects of its application to the soil in its different conditions is not generally understood by those using it. I once heard an old experienced planter seriously proposing to give his sandy *teelahs* a good dressing of quicklime, because he had known a friend who had applied a dressing with good results to a stiff clayey flat which had always been unproductive. The stiff clayey flat was most likely to require lime in a caustic state, but the very fact of his *teelahs* being poor and light was the very reason why, if they wanted lime at all, it should be added in its carbonate state. If marls could be got they would prove the most valuable form in which to apply lime to the majority of our tea soils. Light sandy soils are greatly improved by an application of marl. The soil has greater power given it for holding manure and for keeping a proper amount of moisture. The custom of using marls is one of very great antiquity; it was stamped with success many centuries before the causes were known which led to that success. According to one of our highest agricultural authorities it is very probable that we may again find it wise to return to their more extensive use. It is asserted that the quality of our produce has been injured by the increasing fashion to insist upon a supply of fertilizers which will act with great rapidity and just in proportion to a high-pressure system of production may be adopted, so does it become the more important to take care that we do not overlook any of the essentials of success. I would prefer a good marl for the purpose of adding lime to the great majority of our tea soils before I would lime in any other form. There is no certainty as to the composition of marls, because they are so very variable in their ingredients. It would, however, be a serious mistake to imagine that for this reason they are not valuable as a manure

When the marl beds were submitted to chemical analyses by Professor Way, it was seen why the marls had gained a greater or lesser reputation. The presence of phosphoric acid and potash in the green marl was much larger in proportion to that found in the grey and chalk marls. The action of these marls when applied to land differs according to the useful character of the substances they contain. The use of marl is often adopted in England for other reasons than the simple addition of fertilizing matter, for in many cases marls are exceedingly useful in altering the unchemical conditions of a soil. It is a lasting manure and gives its properties out slowly as the plants require them, therefore the absence of forcing would have a tendency to allow time for leaf elaboration, which is said to be conducive to the better quality of our manufactured tea. The series of natural manures in which lime forms the prominent constituent are certainly of the greatest importance. In many instances they are powerful agents, which, when they are imprudently used, are capable of doing much injury to the soil. They are valuable promoters of fertility when prudently employed, but it must never be lost sight of that just in proportion as we use lime upon ordinary soils under conditions which make it more than usually stimulating, so it is likely to become very exhausting to the land unless we secure a good supply of "bulk" manures to balance the demand made upon the soil. Chalk is capable of doing much of the work which is accomplished by burned lime, but it acts much more gradually It slowly assists in decomposing organic matter in the soil, and does so in such a gentle manner, that it can he used with perfect safety on such soils to which the addition of burned lime would be most objectionable. It is useful as a plant food on all soils, and its action upon the physical condition of heavy clay soils, although very different to that of burned lime, is equally serviceable as a general rule.

PLANTER AND COOLY.

The following extracts from a judgment of the Chief Justice of Colombo in respect to the conviction and sentence of three coolies should be of interest in India, for the principles on which the law proceeds in this country are the same as in Ceylon:—

"This is an appeal from the decision of the Police Magistrate of Hatton, who convicted the first accused, Muniandi, of voluntarily causing hurt with his hands to V Marsden, and sentenced him to receive 15 cuts with a cane and to undergo two months' rigorous imprisonment. The second accused, Marimuttu, was convicted of a like offence on the said V. Marsden, and sentenced to three months' rigorous imprisonment. The third accused, Anthony, was convicted of voluntarily causing hurt with a stick to the said V. Marsden, and sentenced to 15 cuts with a cane and six weeks' rigorous imprisonment. . . . . .

[The Magistrate's judgment is as follows:—

Here Mr. Freeman's judgment is quoted in full. It concludes with the following sentence:—

When a servant wantonly assaults a master, who has not been unjust towards him, and when the master comes into court with clean hands. it has always been my practice in the planting districts, to award exemplary punishment. There are others to be considered besides the actual actors. At the same time I venture to think the delegation of punitive powers to youthful pupils on estates impolitic.]

There is hardly a single statement in that judgment except that contained in the last sentence with which I can agree. It is deplorable that the Police Magistrate should have delivered himself of such a judgment. No doubt on many estates this patriarchal system prevails. The superintendent punishes the coolies himself for any disobedience or fault, and so long as the superintendent does not abuse his position, and the coolies acquiesce, that system is probably much preferable to one in which the interference of the Police Court is being constantly invoked by superintendents, and this Court would certainly not be anxious to interfere. But it must be distinctly understood that such a system has no support from the law, and only rests on the acquiescence of the coolies. The doctrine of a Superintendent's punitive powers which he can delegate to whom he pleases has no existence, except in the imagination of the Police Magistrate. The divine right of kings to misgovern has long been exploded, and it is too late in the day to set up the divine right of superintendents to beat their coolies.

Mr. Carmichael swore at the trial as follows:—"He (T. E. Marsden) was not authorised to chastise coolies. I do not approve of his chastising coolies." But later on he was somehow induced to contradict his previous statement, and to say "complainant is in the position of an assistant superintendent of the estate. His powers are to see that the coolies do their work properly, and, if

not, to punish them . . . He is authorised to chastise coolies reasonably . . . . . Complainant can exercise his own discretion as to the matter of chastising coolies . . . . . I consider the punishment of Viran was reasonable." This is pure nonsense, and Mr Carmichael must have known it to be so. . . . . I convict the first accused of using criminal force under section 342. He was certainly not justified in striking the complainant; but having regard to his youth and the circumstances, I deal with him under the First Offenders' Ordinance, and order him to give security in two sureties of R50 to be of good behaviour for two months. I convict the second accused of the like offence, but, having regard to the circumstance, I am of opinion that a fine of R5 will meet the justice of the case; and I convict the third accused of voluntarily causing hurt with a stick, and in his case, having regard to his youth and the circumstances, I deal with him under the First Offenders' Ordinance, and order him to find securities in the same amount and for the same period as the first accused. I cannot part with this case without expressing regret that it should ever have come into Court. Mr. Carmichael was very ill advised in allowing it, for when Courts of Justice are appealed to, they must administer the Law regardless of consequences. The Penal Code applies to Superintendents and their youthful pupils as well as to coolies, and it might have been very unpleasant for the complainant in this case had Viran complained to the Court of the "reasonable and just punishment ! !" which was inflicted on him.

(Signed) J. W. Bonser, C. J.

STRAY NOTES ON MANURES.

Mr. R. R Harding, Curator, Botanic Garden, Toowoomba, writes in the *Queensland Agricultural Journal*:—

Liquid Manure.—The earth in its uncultivated state is sufficient for vegetation, yet when by cultivation the land is as it were forced to produce a greater increase for the use of man, we cannot raise those rich and numerous crops, so necessary to the existence of the population of a civilised country, without affording the vegetable creation an artificial supply of nourishment. It is no less true in the vegetable than in the animal kingdom, that food must be proportioned to the population in order to maintain it. The mode which art has devised to increase the quantity of food for plants is to manure the soil, in some form or other, so that the primitive elements can enter into the vegetable kingdom. Dung or solid manures in many cases can only be supplied to the soil before the crop is planted or sown, as it could not afterwards be dug in without disturbing the roots.

The Chinese, who are remarkably skilful in the management of manures are particularly careful not to waste the smallest portions. Especially do they apply night soil in a liquid state to all kinds of plants. This manure, with sorts of waste foliage, is put into a tank which is sunk in the ground, and here, in addition to the materials mentioned, they mix as much animal water (urine) as can be collected, or common water, to dilute the whole; and when it is in a state of putrefaction, they apply it to the soil, steeping all their seeds, and dipping the roots of all young plants before planting into this liquid manure. Loathsome as this may appear, yet when we consider it as the means which Nature employs to renovate existence, and continue the circle of creation, we must think of it with admiration rather than disgust. The operations of Nature are always admirable; these elementary substances, which in their simple state would be disagreeable to us, by passing into the vegetable system, are converted into the most palatable and nutritious. It is a common thing in England for gardeners to arrange with dairymen for a constant supply of animal water from their cowsheds. This is used for all kinds of plants at the rate of one pint mixed with two gallons of clean water and they consider this is one of the most effective of liquid manures.

It is incalculable how many valuable materials are wasted in this colony, which would have given vigour to vegetation. This animal water forms an exceedingly powerful manure, containing various principals which, during putrefaction, yield large quantities of ammonia, which likewise contains many valuable ingredients of the food of plants. The composition of this water varies in different kinds of animals and in individuals of the same species, and a good plan, where this water is lying near the sheds, is to dump some sawdust or charcoal into it, which absorbs it, and is easily removed. The green slime of ponds and all stagnant waters make very rich manure; they are considered storehouses of materials ready to return into vegetable kingdom. (A. David.)

That water charged with manural elements has a powerful influence upon vegetable life, is so well known to those who cultivate plants of almost every description as to require no affirmation, yet there is often a wide difference of opinion amongst those who are so engaged as to the value of the different liquid fertilisers or stimulants generally used, some maintaining that it is better to apply manure in a solid state, and that the majority of liquid so used are often stimulative in their influences producing little, if any, permanent good. I will recollect the time when the estimate of manure water even amongst us gardeners was much more prevalent than it now is. The many various solid manures now in use are simply so much food, varying in their influences upon the plant to which they are applied according to the different elements of which they, the manures, are composed, almost as much as do the various articles of diet consumed and assimilated by animals. A given kind of manure may be the best possible for some particular species of plant, affording all the elements requisite to build up and sustain it, and still be of little value to another plant that requires something essentially different for its support. Through the joint result of chemical researches and advanced knowledge in cultivation this is now better understood than it used to be, but the fact is not always realised that the effect of manure in a liquid state must necessarily be in accord with that of the solid matter which is used to make it.

For instance, soot is one of the most exciting stimulants known, quickly becoming exhausted, after which, unless something else is at hand to sustain the exuberant growth thus excited, the plant languishes to a greater extent than it would have done if the extra growth made through the effects of the soot had been non-existent. Soot is generally applied as a top dressing; but it is best to apply it as a liquid manure. I take all that can be obtained, and simply enclose half-a-bushel in a bag and sink it to the bottom of one of the tanks which is sunk in the ground; this holds about 6,000 gallons of water, and all plants are watered, large and small, with this. Visitors often remark how healthy and uəəɹƃ the plants look. The various animal excremental manures are possessed of fertilising as well as of lasting properties in a great measure proportionate to the description of food on which the animals have beenfed. For example, the manure from cattle fed on hay and corn is much richer than if their food consisted of grass. Purely animal manures vary considerably in strength, and their enduring properties in a great measure, are ruled by their rate of decomposition

At the time a plant is put out in the open ground, or placed in a pot or other confined space, solid manure in quantity limited by its nature and strength, as also by the ability of the plant to absorb and assimilate food, more or less freely, can be given; but beyond this we cannot go, as, if too much manure is present in the soil, its effects are identical with those which result from an animal taking food stronger than the digestive organs are able of digesting and assimilating. It then follows that after a time the manure first present within the reach of the roots get exhausted; it then becomes a question of providing more in either a solid or liquid state—the former usually in the shape of a top dressing, the latter by soaking the soil to which the roots are restricted. The use of solid manure, except in a highly concentrated state, is generally convenient for such plants as most frequently need assistance; that is when they have their roots confined to pots, with no access to food beyond the limited space in which they thus exist. It is then that manure water becomes the most convenient, and often the most beneficial in its effects, for in this way food is brought immediately within the reach of the whole member of hungry mouths (the feeding fibres) quicker than by the use of solid matter laid on the surface, which takes time to get washed down in the ordinary process of watering.

There can be no question that the time of active growth in both roots and branches is the proper time for using the manure water, and when plants exist that want assistance in this way, especially such as are naturally of a hardwooded enduring character, I should advise that in all cases some be given as soon as growth commences in either the roots or the shoots; otherwise the first effort of the shoots will be weak, and no subsequent application of manure during the ensuing summer will in that case strengthen them so as to make the collective growth equal to what it would have been

if the food they required had been within the reach at the time they began to grow A matter which it is important to keep in view is, that at the time any plant is just in the height of its growth, it will then bear manure water being given more freely than either at the beginning or later in the season. Another thing of quite as much importance, and which those who are first commencing to grow any plants will find it to their advantage to note, is that plants have not the power to reject the food that is brought in contact with their roots in the way that manure waters; is whether the water they thus imbibe is sufficiently or over-charged with food, they must take it If it is too strong, the effects are seen sooner or later, but often when much mischief is done. It is always well to keep on the safe side; frequent applications are very much preferable to stronger doses, even if they are slightly too strong. As a rule, the slower growth a plant makes, the less able is it to bear manure water in a strong state. This fact, not having been fully seen and acted upon, results in many plants that are generally supposed to be unable to bear manure water at all, such as the slow growing hardwood conservatory plants; yet it is in the case of these subjects, more even than the strong-rooted things, which can bear partial shaking out and renewal of soil, that assistance by the use of liquid manure is often most required. It is scarcely necessary to mention that whenever manure water is used, even to the most vigorous growing plant, which, consequent upon its strength, is able to bear that which be death to others weaker, the liquid should always be clear and transparent, otherwise the sediment it contains is certain to clog up the soil, and make it too impervious to water afterwards. All who have given the least attention to such matters here stated are fully cognisant of the fact that liquid manure, prepared in the usual way by the admixture of water with some solid manurial matter to which it owes its fertility. the potency of the liquid being proportionate to the volubility of the solid matter of course, governed by the extent of dilution.

LIME, NITRATE OF SODA, AND SULPHATE OF AMMONIA, &C. Briefly, lime is most beneficial on land containing much vegetable matter—such, for instance, as peat, and, with the sulphate of iron nearly always present in such soils, decomposes them, and combining with the liberated sulphuric acid evolved, forms sulphate of lime—a valuable fertiliser. Clay soil is rendered more friable, and not so liable to be baked in the summer. Lime consolidates sandy soils, causing a greater retention of moisture. The quantity of quicklime per acre may range from 100 bushels to 400 bushels, depending on the depth it is ploughed in—the more the deeper. As a rule, for surface-dressings to be carried to the roots by rain, it is better to afford mild dressings at intervals of a few months, but not during hot weather. Lime used with nitrates would be a wasteful practice. Common salt is better, in the proportion of two of lime to one of salt, and applied at the rate of 40 bushels per acre. Sulphate of ammonia should be applied to orchards in just sufficient quantity to produce healthy and vigorous growth without causing over luxuriance. Potash (nitrate of) is a good manure for almost all kinds of fruits, but it should not be used in greater quantity than 1½ cwt. per acre; but carbonate and muriate of potash may be afforded in the way of wood-ashes, especially those of green wood, applied at the rate of 40 bushels per acre.

SUCCESSFUL GREEN MANURING. Mr. F. S. White writes in the *American Agriculturist*: Stable or barnyard manure is the best of fertilizers, but we cannot get enough of it and so we must look out for something else. The next best thing for western farmers to look to is green manure. Clover is perhaps the best and cheapest plant for this purpose, and the Mammoth clover the best of the clovers. But how to use clover without being out of the use of the land part of the time is the question. To attempt to get a crop of clover by sowing in oats has proven a failure. This is not a country for fall wheat and spring wheat at best is a poor crop I know of no better way than to sow rye in the corn fields in September or October, and sow clover on the rye in the spring. By this process we can get a crop of rye, have some clover pasture, and a crop of clover to turn under in August or September. But the rye must not be sown too thick, and can be pastured lightly in the fall. By this rotation we could only have the use of the land half the time for corn, potatoes or other cultivated crops. But if we get enough out of the rye and clover to pay taxes and expenses of seed, my opinion is that the three crops of corn grown under such rotation will be worth more than the six crops of corn grown on same land without rest. This six years of rotation will also leave the land, if properly managed, in a high state of cultivation.

DISTRICT ASSOCIATIONS.

NELLIAMPATHY.

Proceedings of a Meeting held at Cottengadi Bungalow, February 17, 1899. PRESENT: Messrs. Burnett, Denny, Griffin, H. Hall, Jones, W. R. Mackenzie, Murray, Welchman and J. C. Abbot, *Honorary Secretary*. Mr. A. C. Griffin, *in the Chair*.

New Members.—Messrs W. R. Mackenzie and W. Hendry were elected members of the Association.

Labour.—Mr. Welchman proposed "That all maistries bringing in 25 coolies or more should get 5 as. a day pay as well as their commission."

After some discussion this proposition was withdrawn. Mr. H M. Hall proposed "That three months' notice should be given to the Association of any proposed alteration in existing rates of pay and commission. before bringing it before a meeting." Seconded by Mr. Burnett and *carried*.

Bazaar —Read correspondence with Dewan and Chief Engineer. The Honorary Secretary stated that Rs.200 had been placed at his disposal by the Cochin Government to improve the sanitary condition of the Bazaar. Also, that a temporary dispensary had been erected.

Roads.—Read correspondence with Chief Engineer.

Labour Act.—Read correspondence. The Honorary Secretary was requested to write to the Secretary U. P. A. S. I. and express the views of the Association on the proposed Amended Act.

A vote of thanks to the Chair terminated the proceedings.

(Signed) A. C. GRIFFIN,
Chairman.

(Signed) J. C. ABBOTT,
Honorary Secretary.

THEN IT WENT ON ALL RIGHT.

The writer of the letter which I am going to copy for you in a moment has a complaint to make. Rather, perhaps, a complaint to place on record, as the reason for it is passed away for the present and she hopes—and we hope with her—that it may not return. The complaint does not refer to any relative, friend, or foe, but to her own heart. It did not work well. It was weak, and for a long time she was unable to find means to make it do better. which was a serious matter, inasmuch as the vigor of the circulation of the blood always depends upon the force wherewith the heart drives it.

Still, it seems to me we ought to be a bit indulgent towards the heart in view of the labour it has to perform. Remember that it never takes a full minute's rest at one time, night or day, from the instant it begins at your birth until, like a muffled drum, it stops for good and all—life's funeral march to the grave being over. During all this while, ten years or a hundred, the heart has got to keep on pumping blood through your body at the rate of from 130 strokes a minute in childhood to 50 or 60 in old age. If you happen to have a mechanical turn of mind it may interest you to figure out how much this stands for in units of horse-power for a given case and time. If not, you can take my word for it that, merely as a machine, the heart deserves your respect. So long as it goes ahead steadily, up hill and down dale, hammering away softly but strongly, you haven't a word to say for or against it; but when it begins to get weak, may be skipping a stitch now and then, you call in the doctor, who puts the tip of his finger just below the base of your left thumb, looks wise and solemn (as befits the occasion), and says, "Ah, yes, yes: I see, I see" But *what* does he see? He doesn't tell you *that;* he leaves medicine, and mentions when he will look in again.

But as to the letter I spoke of. "For many years," the lady says, "I suffered from indigestion and weak heart. Very little exertion made me feel weary and tired. Cold, clammy sweats broke over me. I had a poor appetite, and after meals an aching pain at the chest and a miserable sinking feeling at the stomach. I had also much pain at the left side, and my heart would flutter so as to frighten me. At length I became so weak, I was barely able to get about, being no longer able to do my housework

"Owing to the trouble at my heart I obtained no proper rest at night, and often walked about my bedroom at night. Many times these attacks were so bad *I thought I was dying.* During the day a sense of suffocation sometimes came upon me and I was obliged to go to the door for fresh air.

"Year after year I suffered like this; now a little better, now as bad as I could be. In November, 1887, while on a visit to Croydon, my son-in-law persuaded me to try Mother Seigel's Syrup. He got me a bottle, and after taking it I experienced great relief. The pain at my heart was easier, and I felt better as a whole. I could eat well and the food agreed with me.

"I now felt encouraged to continue using this remedy. Soon I was in better health than for years, the heart trouble having disappeared altogether. Since that time when I feel anything ailing me a few doses of Mother Seigel's Syrup never fail to give the desired relief. I have told many persons of the benefit I have derived from it, and hereby consent to your publishing this statement should you wish to do so."—(Signed) (Mrs.) William Harrington, near Wickford Hill, Clare, Suffolk, November 12th, 1897.

Now what ailed Mrs. Harrington's heart? Why, precisely the same things that ailed her lungs, her nerves and her muscles—*weakness*. Therein she is right. It *was* a weak heart but not a *diseased* heart. The heart is a muscle, and (seeing the prodigious lot of work it has to do) necessarily a strong, active muscle. But it will not work without pay any more than you or I will. With all the rest of the body it has got to be sustained and strengthened by food. Here we have the point, then. The lady was afflicted with chronic indigestion. For this reason her whole body grew weak—the heart, of course, with other parts of the engine. Hence all the symptoms she names. Her immense all-round weakness and puller-down is that same old dyspepsia. When Mother Seigel's Syrup made the digestion of plenty of food possible, the heart went on all right, like a newly-wound clock.

MARKET REPORT.

Advices per Mail of 10th February 1899.

COFFEE.

The *London Commercial Record* says:—Assortment offered at auction during the week was much more extensive and varied than has been seen for some period. There was a good demand for all fine qualities, but the lower grades are still difficult to move. Plantation Ceylon has been in request and sold at very full prices. The recent arrivals of new crop East India sold with great irregularity; colory Mysore and Coorg met with good competition and full prices were paid, but the low middling and less desirable sorts are very slow of sale at easier prices, in fact more on a par with the cheaper kinds of Central American. Jamaica sold with comparative ease at valuations. Fine Costa Rica and Colombian brought very full rates, but parcels imperfectly picked, even when of good color, were cheaper, as were faded and old crop. There has been a declining tendency in "futures" owing to heavy receipts at the Brazils, and closing prices are easier.

Imports Deliveries and Stock of Coffee in London exhibit.—

In the Imports a decrease this year of	1847	tons
Home Consumption an increase of	97	,,
Export an increase of	380	,,
Stock an increase of ...	2403	,,

Auctions this week passed off as follows:—

Ceylon.—26 barrels and bags sold—smalls 47s to 59s, low middling 100s to 100s 6d, middling to good middling 101s 6d to 106s, bold nipped to good colory extra bold 110s to 119s, peaberry 82s to 122s.

East India.—927 bags sold: *Mysore*, smalls 51s 6d to 67s, low middling 60s, middling 71s to 75s, bold good greenish colory 95 to 100s, peaberry 86 to 112s; *Coorg*, smalls 46s to 49s middling to good middling 67s to 75s 6d, bold good bright grey to brownish colory 93s 6d, to 9-s, pea-berry 105s 6d to 112s 6d; *Wynaad*, smalls 42s, low middling to middling 5-s to 60s, bold brownish 79s to 84s 6d, pea-berry 7-s to 102s; *Neilgherry*, old crop, low middling 54s.

Nyssaland.—245 bags sold—smalls 48s 6d to 54s 6d, low middling to good middling blue 59s to 66s, pea-berry 64s to 75s.

Jamaica.—326 barrels and bags rather more than half sold, viz., smalls 31s to 35s, good to fine ordinary greenish 35s to 40s, fine ord. brownish to gray 43s 6d to 46s 6d, low middling grayish and greenish 48s to 54s, good middling colory 77s pea-berry 50s to 75s. 6d.

Trinidad—5 bags sold, good ordinary greenish 35s.

Costa Rica.—1,486 bags sold, smalls 26s 6d to 61s 6d, low middling 52s 6d to 53s 6d, middling colory 60s to 69s, good to fine middling 69s 6d to 88s, good to fine bold blue 89s to 97s, very fine blue 100s to 106s, pea berry 62s 6d to 100s 6d.

Guatemala.—Of 181 bags offered 60 bags sold, pickings 26s 6d, triage 70s 6d, small greenish colory 33s 6d, pea-berry 70s.

Colombian.—Of 1,364 bags offered about 850 bags sold, smalls 30s to 47s 6d, fine smalls up to 60s, fine ordinary greenish 45s 6d, low middling to middling colory 52s 6d to 64s, good to fine middling 65s to 88s 6d, good bold dull green to good blue 75s 6d to 80s, fine to extra fine hard blue 87s to 102s 6d, pea-berry 55s 6d to 96s.

Venezuelan.—Of 211 bags offered 27 bags sold, good ordinary 34s.

Salvador.—Of 177 bags offered 36 bags sold, blacks 26s.

Receipts in Rio and Santos since July 1.

	1898-9.	1897-8.	1896-7.	1895-6.
Rio ...	2,175,000	3,117,000	2,527,000	1,823,000
Santos ...	4,323,000	4,951,000	4,004,000	2,607,000
Total ...	6,498,000	8,068,000	6,531,000	4,430,000
Crop		10,461,000	8,680,000	5,489,000

Rio Exchange 7 13/32d, previous day 7 7/16 d.

Havre, Feb. 9.—Market steady. Santos good average March opened at 37¼f and closed at 37½f, May opened at 37¾f and closed at 38f.

Hamburg, Feb. 9.—Good average Santos March opened at 31⅜m and closed quiet at 31¼m, May opened at 31⅜m and closed at 31⅜m.

New York, Feb 8.—Closing prices of No. 7 Rio were as follow:—

	Feb.	Mar.	April	May	June
Feb. 8 ...	5.45	5.55	5.65	5.70	5.75
Jan. 31 ...	5 50	5.55	5.65	5.70	5.80

Supplies at auction to-day were as follows:—1- bags Ceylon, 20 half-bales Abyssinian, 2,935 bags East India, 82 packages Jamaica, 108 bags Nyassaland, 447 bags Colombian, 72 bags Peruvian, 27 bags Coban, 6 bags Surinam, 466 bags Costa Rica, 183 bags Venezuelan, 60 bags Guatemala, 44 bags Mexican, 54 bags New Granada, and 125 bags Santos. The sales went off with good demand at extreme prices for fine qualities, but common grades of East India were dull of sale at 6d to 1s lower.

According to Messrs. G. Duuring & Zoon, the stocks at the European ports on the 1st. inst. shewed an increase of 1,900 tons, and the visible supply an increase of 1,410 tons, being estimated respectively at 226,400 tons and 388,270 tons, against 224,500 tons and 386,860 tons on the 1st January.

Pricesrealized at auctions for the principal marks of East India:—

TEA.

Indian.—Public auctions have been on a reduced scale, comprising 41,100 packages, against 49,300 packages last week and 34,800 packages at this time a year ago.

There was a strong demand, particularly for leafy kinds under 8d per lb., which were on the whole dearer, Teas for price shewing a little recovery on former rates. For medium and fine grades, when quality was maintained, not much change in quotations occurred, but the less desirable parcels did not always meet with so much attention. The following are among the best results:—Assam: Khobong Estate, AFT. Co., 176 packages, 1s 7¾d; Pabbojan: o., 75 packages, 1s 5d; Hapjan Estate, AFT. Co., 104 packages, 1s 4¼d; Hilika Estate, AFT. Co., 238 packages, 1s 2¼d; Talup Estate, AFT. Co., 150 packages, 1s 2d; Hansura Estate, DDT. Co., 256 packages, and Nudwa Estate, DAT. Co., 122 packages, 1s 1½ per lb. Darjeeling: Seeyok Estate, 96 packages, 1s 8d; Poobong

Estate, 70 packages, 1s 6¾d; Darjeeling Tea and Cinchona Association, 138 packages, and Dooteriah Estate, ATE. Co., 102 packages 1s 2½d; Risheehot Estate, 91 packages, and Tukvar Estate, TT. Co., 118 packages, 1s 1½d per lb Some final invoices of the 1898 crop have been disposed of, and more are catalogued for next week, so that a gradual decrease in the sales may be expected.

For 32,300 packages on garden account 9¼d per lb was obtained, *versus* 8¾d per lb, for 27.800 packages, and 9¾d per lb, for 28,400 packages in the two preceding seasons.

It is gratifying to notice that, in conjunction with increasing home consumption, a further expansion is taking place in exports from this country to the Continent, &c.

Ceylon.—The quantity put forward was rather smaller, viz.; 24,200 packages, contrasted with 26,500 packages on the 31st, and 28,000 packages at the corresponding period of 1898.

In sympathy with other growths more enquiry existed, partly due no doubt to the favourable satistical position of all tea the total London bonded stock on 31st ult. being nearly 5½ million lbs. below what it was at the end January in the foregoing year. Common to fair Pekoe Souchongs and Pekoes were freely taken at occasionally better prices, both by Home and Foreign buyers. Medium sorts were hardly in such request Broken Pekoes especially being here and their easier. For fine and finest descriptions no material alteration in values has to be reported, the most attractive lines being well competed for, a few high figures being recorded, notably Henfold Estate BOP 1s 6d, Lippakelle Estate BOP 1s 4¾d, Campion Estate BOP 1s 3¾d, Concordia Estate BOP 1s 3½d, Waleigh Estate BOP is 3¼d, and Wanarajah Estate BOP 1s 3d per lb.

The average is the same as on the 3rd inst., viz., 8⅛d per lb. opposed to 7½d per lb. in 1898.

Advices by mail report that the weather in parts of the island has been unfvourable, and this would cause a further curtailment of shipments.

Java.—Nearly 1.500 packages of direct import were brought to the hammer, nearly all the lots going off with spirit and fetching fully up to valuations. Only 800 packages are declared for next week.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official return were:—

From 1st to 7th Feb.,	1899	4,498,507 lbs
,, ,,	1898	4,177.198 ,,

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs	Pkgs.	Pkgs.
India	36,979	4,130	41,109
Ceylon	22.276	1,897	24,173
Java	1,412	68	1,480
Total...	60,667	6,095	66,762

Also 540 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon and Java Tea Report, dated February 10th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON,
From 1st June to Date.

	Indian	Ceylon.	Java.
1898-1899.	1,203,578 pkgs.	797,364 pkgs.	32,630 packages.
1897-1898	1,196,348 ,,	836,857 ,,	30,489 ,,

42.190 pkgs. Indian
24,309 ,, Ceylon
1,480 ,, Java
} Total 67,979 packages were offered in public auction this week.

A remarkable increase has taken place in the quantity of Tea exported direct from Ceylon to other countries; figures for some years past being given in the undermentioned table.

1898.	1897.	1896.	1895.
lbs. 23,365,238	17,124,508	14,205,051	12,186,532
1894.	1893.	1892.	
lbs. 9,243,070	8,905,987	6,338.582	

Australia continues to take larger quantities, but the most remarkable progress during 1898 was in Russia and North America, the Tea shipped to China probably also going to the latter market.

Indian.—With animated bidding throughout the sales the market has remained very firm, low priced grades being if anything slightly dearer than last week. while all descriptions with really good liquor continue to sell at very firm rates. The following averages are worthy of note:—"Seeyok," 18/¼; "Ass, Fron. Co. Khobong," 1/7¾; "Poobong," 1/6½; "Pabbojan T Co." 1/4¾.

Ceylon.—The strongest bidding was for Teas under 7d., prices for which were distinctly firmer. For medium Broken descriptions the demand was hardly sustained, irregularity being noticeable, with easier quotations. The following averages may be mentioned:—"Newera Eliya Co. Concordia," 1/0½; "Wanarajah Co. Wana," 1/-; "Holmwood." 11¾d; "Dimbula Valley Co. Lippakelle," 11½d.; "Haputale Co. Kellie" and "ST Co. St, Leonards," 11¼d.

Shencottah.

Average for week 8·09d., against 7·40d. for same period 1898.

Java.—Last week's rates were fully maintained for all descriptions, competition being general, while Teas for price were, if anything, dearer. 108 pkgs. "Perbawattee" avg 9½d. per lb. and 108 pkgs. "Goalpara" 9d. per lb.

Bank Rate 3 per cent Exchange on London three months sight:—Calcutta, 1/4 7/32. Colombo, 1/4 7/32.

COCOA.

Auctions on Tuesday offered 3,847 bags, demand for which was very good, fully 2,300 bags selling at an occasional 1s. to 2s per cwt. advance. 360 bags Trinidad all sold—good to fine red 75s. to 76s., gray to ordinary red 73s. 6d. to 74s. being 1s. beyond valuations. 36 bags Grenada changed hands at 66s. for common up to 72s. for fine red, no alteration in value being apparent 114 bags Jamaica realised 64s to 66s. 6d. for fair to good, which prices registered no change from the last auctions. 48 bags Surinam sold without charge at 69s. to 70s. Of 937 bags Guayaquil 320 bags sold—ordinary grayish red Arriba 74s., ditto Caraquez 7 s. to 71s., Tumaco 67s. 6d., which figures were about on a par with those realised last week under the hammer. Ceylon growth produced some sensation, the fine grades being eagerly competed for at a jump upwards of 3s. per cwt., whilst other qualities showed no appreciable alteration; 2,045 bags were catalogued, more than half of which sold at 78s to 81s. for fine and superior red, 67s. 6d. to 73s. 6d. for grey to good bold red, 58s. to 66s. for pickings, and 40s. 6d. up to 63s. per cwt. for blacks.

PEPPER.

Black.—The market for parcels on the spot and forward delivery is firm, with sales of of 2 0 tons Singapore—at 5 3/16d. to 5¼d. for fair quality on the spot, at 5 1/32d. March delivery, at 5 3/32d. April, at 5½d May, and same price June; but for arrival the market is quiet and value lower, with sales of 100 tons, at 5 7/16d. near at hand and at 5 9/16d. to 5 11/32d. March-May shipments

At public sale on the 8th inst. 497 bags Singapore and 1.062 bags Penang all passed the hammer unsold, with the exception of a few lots of damages

White.—The market maintains a steady appearance, with sales of about 100 tons, including fair Singapore on the spot at 8¾d., and February-April and March-May shipment at 9d., fair Penang on the spot at 7¾d. to 7⅞d., January-March shipment at 8d. and March-May at 8 3/16d.

At auction on Wednesday of 493 bags Singapore brought forward 120 bags sold (mostly prior to auction) at 8¾d. to 7⅞d. for fair. Of 173 bags Penang 20 bags fair realized 7¾d. to 8⅞d. per lb.

Closing Report.—Market firm. Black Singapore February-April 5 7/16d buyers and March-May 5½d. buyers. Of White, 10 tons Singapore March-May shipment sold at 9d.

25 tons Tellicherry sold to arrive per February-April at 48s. 6d per cwt. c.i.f. delivered weigth New York.

GINGER

Cochin.—The spurt in demand has quite died away, and the whole of the offerings, comprising 126 cases, 806 bags, passed the hammer unsold in the absence of bids near the mark. Subsequently 25 bags of good medium and small washed rough were placed at 28s. per cwt.

African.—97 bags fair sold at 19s. 6d. per cwt

INDIA RUBBER

Though the receipts at Para continue very large—2,100 tons to yesterday—prices are fairly firm. A small sale of fine forward was made at 4s. 1d per lb. but about 50 tons have been sold at 4s. 1½d., March to May delivery. Scrappy is still offering and neglected also Island negroheads at 2s. 11d.; soft fine is scare, and sales at 4s. ¾d. to 4s. 2d.

No auctions to day. Medium Rubber is firm and scarce, and good parcels will meet a ready sale.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 17th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Please note the change of address.

Coorg.

Polli Betta, *8th Mar. Weather.*—It looked very cloudy and threatening on Sunday; but beyond a few drops no rain fell. Rain would be in good time in a fortnight more. Clouds flit by every day. *Crops.*—Gleaning going on. Last blossom appears to have set. Pruning is being pushed on with; but there is a good deal to get through. *Labour.*—Sufficient. *Health.*—Generally good.

BRAZILIAN COFFEE.

We are glad to see not only that our remarks some 2 or 3 months ago about Brazilian coffee have been republished in Brazil, but that certain influences are at work to give support to our belief that the time for pessimism with regard to coffee has passed. Allowance must be made, no doubt, for the wishes of Brazilian planters as well as Indian. Interested alike in prospects of a rise in prices, both may allow the wish to become the father to the thought. Hence, sanguine estimates of prospects must be received with some reserve. It appears certain, however, that tight money and a higher level of exchange are having the natural effect of checking coffee-production in Brazil, just as they are in India. It will take time for this effect to become visible in statistics, but the reports that reach us tend to show that coffee growing in Brazil is by no means as alluring as it once was to the investor. There is a movement for combination and union in nearly all the centres of the coffee producing area. This looks as if

things had not been going altogether well from a financial point of view. So strong is the movement, that the Santos correspondent of the *Brazilian Review* even considers it extremely likely that a total reform of the political parties will be brought about by this movement, which professes to be eminently economical but evidently aspires to greater influence and weight in the legislation and direction of public affairs. In short, Brazil is likely to have an agrarian party, like England had, and France and Germany have at present. We may readily concur in his remark that "whether the union of the most important classes in the State of S. Paulo into a party will prove beneficial, depends upon their aspirations and the way in which they will formulate them and will want to attain their end. If they study the causes of the present crisis and learn from the economical history of other agricultural countries, which have partly or totally become industrial since, they will be of great value for the development of the country, which is entirely agricultural. Anyhow, this unrest and this activity, without direction yet, shows the precarious situation our agricultural class is in, and it looks as if the crisis will be still more aggravated by scarcity of hands." Planters wished to reduce wages, but this, we read, they will not be able to do, as the extension of coffee plantations, which would in a way compensate for the reduction, has almost come to a standstill for want of suitable land in the other districts and above all for want of money to undertake the extensions. This circumstance induces many Italian colonists to abandon fazenda work and go home or live in the towns, as the produce they derived from planting vegetables or maize between the rows of young coffee trees (older ones, extending too much, do not allow it) was their chief income and this is now done away with for the above reasons. So there is an actual scarcity of hands, which might become still greater should the treaty of commerce that Italy concluded with France lately, stimulate industry and agriculture in the first mentioned country, thereby stopping emigration.

There are pessimists as well as optimists all the world over, so we must not accept the opinion of one individual as absolutely reliable. Still, we cannot fail to be cheered by the perusal of such distinct utterances from a Brazilian source as the following: "The coffee growing industry is no more a paying one." If Brazil discovers this to be the case, a reaction in prices is certain to follow, and Indian planters would no doubt be very glad to see it. It is stated that even estates bought at comparatively low prices and worked by cheap European capital, like the S. Paulo Coffee Estates, are not remunerative. Messrs. Hayn, Roman & Co., Havre, point out that only on £120,000 preferred shares has the foreseen dividend for 6 months been paid, but nothing on the £150,000 ordinary shares. Besides, they point out that this company, founded in July 1897, although it had to pay cost of keep and production for the six previous months from 1st January 1897 had only to pay interest on debentures and dividends from 1st July 1897 onward. In the current season these expenses will be doubled. The company carried forward £3,057. This season the estimated outturn of the estate, 140,000 *arrobas*, has not been attained. From information gathered up-country the actual yield is only 98,000 to 100,000 *arrobas*. Now the average gold price of coffee has been lower this year than last, especially for washed coffees, of which this Estate produces a fair amount. It is not likely, therefore, to show a profit. The fittest will survive, the rest will have to stop; and if Brazilian coffee culture has to pass through a period of storm and stress, the probability is that prices will begin to firm up all over the world. The latest advices received from Brazil estimate the total crop of Rio and Santos at about 8,267,000 bags, but Brazilian estimates bear a bad name. *Apropos*, however, we may refer to recent remarks by Messrs. Dubbing & Zoon:—"It has been satisfactory to observe, that deliveries have again been on an increased scale, as much as 34,960 tons more in Europe and 22,760 tons more in the United States. This year's augmentation chiefly means more consumption, judging by the figures of duty payments in six principal European countries. If the present Brazil crop should indeed turn out to be moderate, stocks will soon show a reduction and it now looks as if the maximum had been reached. . . . Three years of excessive production raised the visible supply from 197,000 tons to 410,000 tons. Reduced crops and steadily increasing consumption are likely to put an end to overproduction. In so far, and considering the present low range of values, the outlook for the coming year is decidedly brighter, although it would not yet be wise to take too rosy views. Invisible supplies are still considerable, and much depends upon the coming crops in Rio and Santos, about which reports are still conflicting. Past seasons have taught us, how little can be depended on Brazilian crop estimates. In case next crop in Rio and Santos should turn out about equal to the present one, say about 8 million bags, which is still an open question, values of coffee would not be long in reaching quite another basis."

Without desiring to pose as optimists, we may frankly express the belief that the chances of an upward movement are greater than those of further depression. Recent New York quotations lend some little support to this opinion.

TEA AND ITS PESTS.

In a recent number the *Ceylon Observer* remarked on the entire freedom of tea on the Hauteville Estate from fungoid or insect pests of any kind, and gave the Manager, Mr. Jackson's explanation of the safeguard he adopted against the approach of such enemies. Mr. Jackson stated that after pruning he removes all gormandizing stems, and roots with sharp alavangas; (2) he buries all prunings green in holes, one to every four trees in every alternate line, and in certain soils supply unslaked coral lime with the mass of green prunings; (3) he removes all moss on tree, and ground and wash the trees with kerosine oil and soap mixture The cost of the latter 'mossing and bugging' is from Rs.3 to, eventually Rs 1·50 per acre of pruned tea. He does not think there would be much complaint of insect (or fungoid) pests, if everyone did this regularly, and he says it keeps the trees in a very healthy condition and far more ready to respond to all other treatment. He has followed this plan for years on tea and has successfully used this 'Kerosine Oil Emulsion' to coffee also. As to burying green prunings, &c., after a number of years he finds he is able to reduce more expensive manuring very considerably, and yet get as good yields, &c. It is by no means implied that 'mossing and bugging' once means a lasting preventive. Mr. Jackson, indeed, lays particular

stress on the fact that safeguards such as he advocates must be imperfect so long as they are not generally adopted. What is done by one man's care is but too apt to be undone by another's carelessness.

COFFEE PRICES.

Reports of sales of East Indian coffee between the 9th and 17th ultimo, contain some instructive information as to prices. There has been some despondency of late in regard to values of coffee, especially among Mysore men. This, no doubt, has been partially due to a fall in prices of the Mysore berry, resulting from deterioration of quality. What *can* be done is shown by some of the prices lately realised, which afford testimony to the value that the Home trade sets on parcels of exceptionally fine quality. A few leading figures will suffice to illustrate our meaning The following sales are reported :—

Coorg.						
					P.B.	T.
Faith	115/-	109/-	98/-	135/-	70/-	
Chisholms }	101/-	76/-	—	112/-	50/6	
Silpikadu }						
A. B. Heroor	101/-	75/6-	48/-	111/-	52/6	
Mangles }	100/6 to 101/-	76/-77/-	49/-	111/-	50/-	
Allicutty Mountain }						
Mysore.						
Utollalu Mockett ...	107/-	90/-	69/-	123/6	65/-	

The "Faith" figures are a splendid record, 135*s.* for peaberry and 70*s.* for tryage; in fact, any of the above sets of figures must surely show that profits are still to be made out of coffee. But we have, of course, given the pick of the bunch. Coorg figures go as low as 75*s.* No. A, and 98*s.* peaberry. Mysore 50*s.* 6*d.* per bid and 75*s.* (bid); Nilgiri (of which very little was offered,) ranges from 61*s.* to 92*s.* for No. A, while a small lot of peaberry fetched only 80*s.* Wynaad figures are just about as unsatisfactory, though 102*s.* was touched for peaberry. Nelliampathy averaged well, ranging from 81*s.* for A to 103/6*d.* peaberry. A glance over the list given in our Market Report columns will tend to show that there is Indian coffee and Indian coffee, and that while the tryage of certain Coorg marks ranks far above medium Brazilian coffee, size C of Mysore, sizes B and C Nilgiri, and size C even of Coorg berry in rare instances, might easily be classified with Brazilian in so far as price is concerned. For our part, we have faith in Indian coffee still, if planters will but aim at maintaining great superiority of quality, and we regard it as a good augury that "Faith" should have stood so easily at the head of the market during recent sales. It would be interesting to know how far artificial fertilizers had a hand in the game.

INFLUENCES OF THE PLAGUE SCARE.

In some respects Indian planters have certainly had occasion to regard the plague as a blessing in disguise. It is, indeed, surprising to note how great has been the influence of this dire disease at a very long distance from the scene of its operations. Among Europeans in Southern India there has been no scare on account of the outbreak of plague in various places. But a London paper has seriously published the following remarks :—"The Indian Mutiny with its terrors was the outcome of outraged religion, of religious fanaticism on the part of Native contingents in the Indian army; what will be the sequel, if Government, forced by a rapid spreading of the plague, has to adopt extreme measures? They might throw the whole Indian population into a religious frenzy, the prospects of which would be too terrible to contemplate." Our contemporary realises that this is an extreme view to take, and adds:—"The European portion of the Indian army, we feel sure, would be able to quell effectually any plague riot; but there is no disguising the fact that the position is regarded in India as very grave indeed." It then proceeds as follows:—"How would trade here be affected by the plague? It would probably mean a repetition of last year's experience. Natives not finding any sale for their goods in India, the Bazaars being closed, would consign to Europe all they possess, and would sell cheaply in order to realise money to fly to places of safety. It is a most uncomfortable feeling to planters and shippers alike to know that at the slightest sign or threat of a visit of the plague in their district, their coolie workmen and staff would desert them at a moment's notice, leaving the half-gathered crops and unshipped goods to rot where they lie. This uneasiness and uncertainty naturally interfere greatly with business in the threatened districts, and have consequently a disturbing effect on trade in the whole of India. The natural desire is to ship as quickly as possible as long as there is labour available, and to approach further business entailing distant shipment with great amount of caution. News from the affected parts of India is therefore looked forward to with great interest and anxiety.

The exaggerations in the above are so great that criticism is uncalled for. He would be a strange planter, indeed, who was not always in a hurry to get his products to market unless that market showed unmistakable indications of a rise in prices. "Further business entailing distant shipment" is a matter for merchants rather than tradesmen, but while there is good reason to believe that merchants are leaning towards a curtailment of "future" business in view of the *possibilities* of plague, few, if any, in this Presidency, regard this dread scourge as likely to be comparable with the Indian mutiny in its disastrous influence on trade!

THE UNITED COFFEE GROWERS COMPANY, Ld.

The scheme of co-operation among coffee planters has taken shape, and a small company has been started "for the purchasing or receiving of coffee or other produce, and preparing the same for sale, but more especially for the preparation and sale of coffee, roasted and ground; and, if deemed advisable, to act generally as merchants and agents for planters: *Capital:* Rs.200,000 in shares of Rs.100 each. *Directors*: Messrs. Alex. Allan, Coonoor; A. G. Nicholson, Coonoor; James Stanes, Coonoor; W. Rhodes James, Coonoor; and E. P. Oakshott, Madras. Agents in India and London, Messrs. Gordon Woodroffe & Co. Further details are given in our advertisement columns.

That we wish the Company success, goes without saying, for its success would no doubt be of service to coffee-planters in stimulating demand for the product they devote their attention to. At the same time, this service can only be a small one unless the Company develops into something much larger than it is to be at the start. Machinery is to be erected capable

of dealing with about 300 tons of coffee per annum, with motive power to drive machinery of double this power. The following statement is given to show that with an outturn of only 100 tons per annum, a 13 per cent. dividend should be earned :—

To	Rs.	By	Rs
Purchase of 100 tons coffee at 750	75,000	100 tons coffee roasted, ground and tinned, less, loss in roasting, say, 25 per cent. = 75 tons at 14 annas per lb.	1,47,000
Cost of tins, labels at 2 annas per 1 lb. ton for 75 tons	21,000		
Stuff including export for Roasting, etc. ...	6,900		
Distribution and Freight on 75 tons at 35 ...	2,625		
Travelling and samples at 500 per month	6,000		
Management, Office expenses, etc.	6,000		
Depreciation of Machinery and Buildings at 7½ per cent. on Rs.30,000 ...	2,250		
Contingencies	1,225		
	1,21,000		
Balance, Profit...	26,000		
	Rs... 1,47,000		Rs... 1,47,000

Rs.37/8 per cwt. does not appear to be a price that will stimulate the production of high-class Indian coffee and on the other hand 14 annas per lb. *nett, wholesale,* is scarcely a rate that will stimulate consumption. The figures are, however, obviously not intended to be accurate, for to turn over 100 tons of coffee per annum would not involve the employment of Rs.200,000 capital. Consequently either higher prices might be paid for coffee purchased or lower prices be accepted for coffee sold, and still the estimated dividend earned. Again, with an increase of turnover, the above figures might be greatly modified, and we see no reason why the Company should not, under careful management, be worked profitably. It is to be feared, however, that Coorg coffee will remain entirely, and Mysore almost entirely, beyond the sphere of the Company's operations. Whatever reputation it may achieve for its coffees, therefore, will probably not be the highest that might be achieved by East Indian coffee. As regards the competition of imported tinned coffee, we fear too sanguine a view is taken. The price of 'Lion' brand roasted coffee in New York, for instance, is $10 per 100 1 lb. packages—say 5*d.* per lb. What is to prevent this, or other similar brands, from being imported, at less than *one-half* of the price to be asked by the new Company ? There is just a possibility that our result of the new Company's endeavours may be to give a stimulus to the '*importation*' of coffee, by stimulating a demand for the 'tinned article' we trust, however, that as it progresses it will see its way to disarm competition of this sort.

THE AMERICAN TEA MARKET.

A writer in the *Journal of Commerce and Commercial Bulletin* (New York) has elicited some very interesting remarks from Mr. Blechynden. The envoy of queen Tea states that when stocks are taken into account the consumption of coffee in America will be found to be about the same as in previous years, although the importations are larger; also that although the contrary is asserted, the official figures show an actual increase in the net imports of tea during the five years ending June 30, 1897. The longer the period taken for comparison the more marked is the increase, not only in actual imports but the imports *per capita*. The fact that there has been a great reduction in the imports during the current season is, he says, due to causes other than a decrease in demand. But apart from that fact the comparison of the figures of any two selected years is apt to be misleading, as is shown when those for 1896 and 1897 are taken. The imports in 1896 were some 93 million, and in 1897 some 112 million pounds. The great increase in imports did not mean a corresponding increase in consumption, but was due to the fact that the tea season was an early one, the Government, or fiscal, year not corresponding with the tea season, and much of surplus should be credited to the following season's account. Mr. Blechynden holds that the causes which reduced the importations this season are, first, and most important, the sudden imposition of duty on tea, and, secondly, the passage of the Tea Act in the previous year 'to prevent the importation of impure and unwholesome teas.' To understand the present position of the tea trade these two factors have to be considered together. The 'tea law' has undoubtedly excluded much of the rubbish which used to be imported and which was responsible to a great extent for the comparatively small amount of that article consumed in this country. The latter measure paralysed the trade for many months, as retailers would not meet the enhanced cost of tea by a corresponding price. The two together placed a premium on the surplus stocks of bygone seasons, heretofore unsaleable, some of which had been in the country as long as twenty years. Such stuff acquired a fictitious value, as there was no other cheap tea in the market and no more could come in. The amount of this antiquated trash and the amount of stock actually held in the country has been a surprise to most of the trade and has been the only obstacle to the development of business in new teas. What these stocks must have been can be gathered from the fact that, although some 40 million pounds of tea were imported from June 1st to December 1st, 1898. but 12 million pounds were cleared, or paid duty, during that period. It is now known, we are informed, that there was from eight to nine months' supply in the country, that these are gradually being absorbed and that until they are absorbed, business will remain dull. It is cheering, therefore, to learn also that "all the rubbish and accumulations of previous years have been swept away, and thanks to the new tea aw only fairly good teas will be admitted. Stocks are ower than ever and when the demand from the country egins to come in it must continue and be a lasting one. The tea in bond is in strong hands."

ADULTERATED COFFEE.

There are signs that many coffee planters think that the English law does nothing to prevent the adulteration of coffee ; but this is not so. Almost every Mail brings us advice of prosecutions instituted and penalties imposed.

for although the law needs amendment no doubt, it at least does something of what is required by advocates of pure coffee. Among the cases advised by this Mail is one where 40% of chicory was mixed with coffee. We are glad to note that the grocer in fault was fined £5.

In the United States also this matter of adulteration is receiving attention. The North Carolina Agricultural Experiment Station has instituted an investigation of the food supplies for sale in the State, with a view to ascertaining the extent to which adulteration is practised. As regards coffee, samples were bought in the open market, twenty were examined, and seven (representing 35 per cent.) were found adulterated. Lown's "Capital," "Star," and another without a name were found excessively glazed; "Red Seal," "Hero," and "Crescent" (Smith Brothers) were found to contain excessive amount of coffee screenings, and "Number Twelve" was found to be excessively glazed and to contain also an excessive amount of screenings. All cheap coffees examined were glazed. The report says:

Coffees are often roasted with the addition of sugar or syrup. This is called glazing. Some coffee roasters claim that it is necessary to glaze coffee to prevent the loss of its aroma, or the addition of qualities that are injurious to it. Experiments have shown that coffee roasted with sugar weighs from 4 to 12 per cent. more than the same coffee roasted without sugar. This gain in weight is a decided advantage to the roaster, and as decided a disadvantage to the consumer. The increase in weight is due partly to the roasted sugar and partly to the water, which is retained to a greater extent by the glazed than by the unglazed berry. Excessive glazing gives the berry a glossy black appearance, and the dark-brown substance formed by roasting sugar colors the coffee infusion and makes it appear stronger than it really is. Moderate glazing need not be considered an adulteration if the fact is stated on the label; excessive glazing must be considered so under any circumstances.

Seventeen samples examined showed from 0·73 to 2·78 per cent. of cold water extracts; fourteen exceeded 1 per cent., and four samples over 2 per cent. organic extract.

Of three coffees costing over 20 cents per pound, all were unglazed.

Of fourteen coffees costing less than 20 cents per pound, all were glazed.

It is curious that while some manufacturers assert that glazing is necessary to the preservation of the coffee, all the high-grade coffees were unglazed, and all the low-grade glazed. If glazing is necessary to preserve the good qualities of a poor coffee, how much more necessary ought it to be to preserve the better qualities of a fine coffee.

The coloring of coffee, to imitate better grades, or otherwise improve the commercial value, is called facing. Some of the pigments used are Prussian blue, indigo, lead chromate, clay, azo colors, and charcoal The raw berry is moistened with water containing a little gum and agitated with the coloring mixture. The coloring matter used forms only a very small percentage of the coffee; and while the pigments might be harmful if consumed in appreciable quantity, one would have to drink a large amount of coffee to take even the smallest medicinal dose. There is no evidence that the coloring matter is injurious to the health, but injurious or not, its presence is an adulteration.

No high-priced coffee was found adulterated. Purchasers are advised to beware of coffee which has no brand and to which the roaster or importer is ashamed to fix his name.

Tests for imitation coffee were made in every sample examined; no imitation coffee was found. The present low price of coffee probably discourages the manufacture of imitation coffee. Cheap coffee is so cheap that it hardly pays to manufacture coffee to mix with it, and high-grade coffee can be more easily mixed with cheap coffee with less danger of detection. This may account for the absence of the imitation in all the samples examined.

NOTES.

The Coorg Planters' Association. A General Meeting of the Coorg P. A. will be held on the 13th inst.

Ceylon Tea Shipments to the U. K. The actual shipments for February were 7 3/4 millions the same as the estimate. The estimate for March is 8 to 8 1/2 millions.

South Mysore Planters' Association. The Annual General Meeting will be held in the Travellers' Bungalow, Saklaspur, on Thursday, 30th instant, at 1 P.M.

Cinchona Bark in Venezuela. The following are statistics of exports in 1895 and 1896:—

1895.	1896.
33,055 kilos.	13,917.

The Tea Tax in the States. It is stated that the war taxes in the United States are to continue two years longer. This, of course, includes the import duty on tea.

Ceylon & Australia. Shipments of Ceylon tea to Australia during February 1899 amounted to 1,740,632 lbs., as against 1,031,972 in the corresponding month in 1898, and 787,916 in 1897.

The Calcutta Tea Sales. At the last tea sales of the season 2,500 packages were sold. The market was active and advancing. Common grades were chiefly in request. The average price at the previous sale was only 4 as. 2 pies.

Vanilla. Owing to a bad crop, the quantity of Vanilla exported from Mexico in 1897 was barely half of what it was in 1896, but the very considerable increase in price served in great measure to compensate this loss.

The Java Coffee Report. It is stated with regard to the coming coffee crop in Java that the private crop is estimated at 350,000 piculs and Government's crop at 250,000, in all 600,000 piculs against 300 to 350 thousand last year and 1 million in 1897.

Ceylon—not India. A Vancouver paper says: "Mr. May's new grocery store at the corner of Pender and Howe streets is a model of completeness. A prominent feature is his complete stock of 'Hondi' Ceylon tea." Ceylon to the front again!

Kashmir. The import duty on tea in Kashmir is about to be reduced from about 16 to 5 per cent. *ad valorem*. A large quantity of China tea is consumed, and Kangra Valley planters also supply the market.

Rubber. It is reported from Home that a large Company is to be started in London for the cultivation of Para rubber in the Straits, with a capital of 10 millions sterling. The Company is the outcome of the great demand that exists for manufacturing purposes—a demand which is increasing, and which the present sources of supply are quite unable to meet.

A "Pretty" Tea. The *Canadian Grocer* remarks :—"A small consignment of tea was received the other day by J. Wilson, Toronto, representative of the Indian and Ceylon Tea Co., the counterpart of which was recently sold at auction in London, England, at 16*s*. per lb. It is an Indian golden-tipped pekoe. It is a decidedly pretty tea."

Coffee in Northern Burma. In order to get rid of the leaf fungus, a Toungoo planter writes :—"We are burning down everything except small fields, lightly attacked which we are spraying with lime, sulphur and blue stone, with what success we hardly know yet." After this fresh seed is to be tried ; but really careful cultivation is imperative.

Mr. H. O. Newport in Queensland. The newly appointed "Instructor of Coffee Planting" to the Government of Queensland was, when last mail advices left that colony, on a tour up the North-eastern Coast to report on the existing coffee, suitability of land for opening, &c. This report will be of interest to coffee planters in Southern India as well as in Queensland.

The London Tea Sales. Reports of 2nd ultimo are not quite so favorable. Though the market was termed "steady," the Ceylon average was only 8½d. a fall of ¼d., and the Indian average only 9d. (or ½d. down). Of Ceylon, 21,000 packages were offered, 20,000 sold ; of Indian 46,000 offered, 42.000 sold. The stock of Ceylon Teas was 17,000,000 lbs. which shows a decrease of 1000,000, lbs.

The Consumption of Tea in the U. K. It was stated at the last meeting of the General Committee of the Indian Tea Association that there was an increase of 6 million lbs. in the home consumption of British grown tea during the last 12 months, and an increase of 3 million lbs. in the exports, making a total expansion of 9 million lbs. India showed a gain of 11 million lbs. for the year against a decline of 2 million lbs. in Ceylon teas.

Labour on the Pulneys. Our "Season Report" friend at Dindigul sent in his 'copy' so late last week that we had to publish his accusation of error on our part without comment. Our statement in issue of 25th ultimo was, however, *not* wrong, as he asserts, as we mentioned that we were alluding specially to *parts* of the Pulneys, and in doing so, we wrote on the authority of the proprietor of an estate which, as we remarked, had been abandoned because of the scarcity of labour. We are not free to give details

Bolting Coolies. A South Kalutara (Ceylon) correspondent gives the Tamil labourer a bad name. He writes :—"Tamil coolies giving a deal of trouble ; dishonest chetties have, I believe, started eating-houses in various centres and harbour run-away coolies whom they pass on to a kangani under advances, to bring coolies from the coast. Of course this kangani is in the trick and allows the coolies to bolt. After a month or two they are again transferred to some other kangani in another district. This triangular business is, I am told, carried on to a great extent."

Ceylon Tea Properties for Sale. Under an order of the Court of Chancery in England, the estates known as the Bunyan and Ovoca tea plantations in Maskeliya and belonging to the estate of the late Mr Thomas Gray, will be offered for sale by public auction on Thursday, the 27th proximo, in London. The extent of the properties is nearly 563 acres of excellent tea soil, of which 533 acres are under cultivation, the remainder being planted with fuel trees or waste land. A Madulsima Estate is also included among the many estates for sale in the market. The estate consists of nearly 1,100 acres, 300 of which are planted with tea in full-bearing.

Para Rubber. The following figures show Rubber receipts for the last six months of 1897 & 1898 :—

	1897.			1898.	
July	1,035	tons	Against	1,119	tons
August ...	1,130	„	„	1,370	„
September ...	1,650	„	„	1,750	„
October ...	1,860	„	„	1,920	„
November ...	2,675	„	„	2,475	„
December ..	3,166	„	„	2.585	„
	11,516	tons		11,219	tons

or a decrease of 297 tons during the last months of 1898.

Colombo Tea Sales. Regarding the sale on 1st instant, the *Times of Ceylon* reports that the excitement prevailing the previous week was not repeated, but satisfactory prices were obtained. About 8,441 pkgs. = 650,524 lbs. were offered, of which about 7,253 pkgs. = 556,552 lbs. were sold The sale passed with a very firm tone, all common leaf tea being in strong demand and prices generally shewing a further advance. Broken Pekoes were somewhat irregular and rather neglected, except strong thick liquoring leafy sorts, which were well competed for. Among the finest teas in the sale were : Glasgow, Rickarton and Naseby. From low-country estates, good invoices were offered from—Torwood, Arapolakande, Pallegodde, Farnham, Folatagama and Eila.

"Orange" Pekoe. The *Canadian Grocer* states that "a couple of years ago, tea brokers in Canada were annoyed a great deal by the samples they received from London being flavored with oranges. Representations were made to the postal authorities in England, with the result that greater care was promised in

the future. Up to quite recently this promise was carried out. Now however, the same trouble has again cropped up. The contamination is caused by the mail bags containing the samples of tea being put in proximity to the shipments of oranges in the holds of steamers crossing the Atlantic." Apparently this genuine "Orange" Pekoe or Congou or whatever it may be, does not find favour with buyers and brokers have to wait for fresh samples of tea before they can do business.

Adulterated Tea in the United States.

From a report on investigation made by the North Carolina Experiment station it appears that nine samples of tea were examined, and four (or 44 per cent.) were found faced with black lead or Prussian blue. The Director states that facing is not injurious to health, but makes the tea appear better than it really is. and is a practice to be condemned. As the *American Grocer* remarks, however:—It is scarcely fair for analysts to use the percentage basis of comparison in arriving at the extent of adulteration. If only two samples had been examined and one found impure, it would show that fifty per cent. of the samples examined were adulterated, but it would be preposterous to assume from that that 50 per cent. of all articles of like nature were more or less debased.

The Government Botanist.

We note that this official is to draw Rs.700 a month, plus Rs.50 a month Exchange Compensation allowance and Rs.125 a month House-rent allowance. Why Exchange Compensation allowance should be granted in the case of officers engaged in the year of grace 1899, with the rupee fairly steady at 1*s.* 4*d.* is one of those things that "no fellah can understand!" Planters must hope that it does not mean that Government hopes to engineer exchange up to par again, and then dock this particular allowance. "House-rent" allowance is an antiquated anomaly, "Exchange Compensation allowance" a modern one. Both might well be dispensed with henceforth, and salaries assessed on a simple basis—pension contingencies being of course taken into account at the time of assessment.

Leguminous "Manure."

Apropos of Mr. B. Nelson's interesting letter on another page, we may remark that an ex-Ceylon Planter writes from South India to the *Times of Ceylon*:—"I never have had an opportunity myself of trying leguminous plants as manure; but the system adopted on many tea estates in India of hoeing in the weeds, and burying prunings when tea is pruned, acts as green soil manure, and, I have no doubt, prevents the soil from becoming too quickly exhausted, as would appear to be the case, in many instances in Ceylon, shown by the falling off in yields. In land that is not too steep, if we were to sow some leguminous plant, such as mustard or indigo, which would prevent the spread and growth of seed weeds, and hoe this in, instead of the natural weeds, I think it would do more good in adding to the fertility of the soil."

"Indian Gardening."

Our Calcutta contemporary is, like ourselves, trying to please its readers, and catering to suit their taste. A Calcutta lady has now promised a series of letters from the hills on gardening for ladies. The writer is said to be an authority on gardening, and if she really gives her notes a pleasing shape the letters should be very attractive. The promise of closing remarks on "savoury dishes from purely Indian products" scarcely savours of gardening, but perhaps that will not detract from the interest of the recipes promised. *Indian Gardening* is a very pleasing paper in many ways, and no doubt its proprietors know what they are about when they go in for what at first sight looks like somewhat eccentric "cross-breeding." The first "Ladies' Gardening Letter" is dated from *Coonoor*, by the way; so that it directly concerns readers in Southern India.

Planters and Progress.

At the last meeting of the Legislative Council of Ceylon, on 2nd inst., the Hon. Mr. J. N. Campbell stated that exchange had been a loss to the planting community, which would represent a large loss to the planters, and Government have gained Rs.7,20,000 by the remittances sent home. Planters, he said, do not object to the improvement of the country in various ways, else he would not represent them, but they wish to know whether they bear an undue proportion of the taxation and for that reason a Committee to inquire into the incidence of taxation had been appointed. The Planters' Association were not unreasonable and they had pressed for this reduction, [of railway rates] which he only asked should be made for one year or until the report of the Committee on taxation was received and if they were not taxed more than the rest of the community it should be withdrawn. He hoped his request would be favourably received.

Coffee Possibilities of Porto Rico.

Assistant Secretary of War Meiklejohn (American) has made public an abstract of a report made a short time ago by W. Korda to General Brooke. The report refers to a recent visit made by Mr. Korda through some of the cane and coffee districts of Porto Rico. Mr. Korda was commissioned to make the trip by the Association of Agriculturists and Manufacturers of Porto Rico, for the purpose of ascertaining the state of affairs in the coffee regions, and, in behalf of the association, to inform the United States Government, in case it were deemed advisable or necessary, of the general condition of the country. The itinerary made by Mr. Korda was through the vast and rich coffee districts of Ciales and Jayuya. He says that every foot of this ground gives forth some fruit or profit. The ground which is not covered by coffee or cocoa trees produces plantains, bananas, tobacco, corn, peas, sweet potatoes, etc. Pure running water is met with everywhere. The coffee crop then being gathered was abundant, and promised to reach 15,000,000 pounds.

A Rubber peculiar to Columbia.

In a recent official report, the British Consul at Tolima, Columbia, makes the following reference to a tree which is little known as a producer of rubber. If the rubber is really of good quality, it may in time prove of importance, owing to its adaptability to high elevations, which, as a rule, is not true of rubber trees. The report says:—A very important species of rubber is indigenous, and I am inclined to think peculiar, to Tolima. Unlike other important kinds of rubber, it grows at high elevations, namely, at from 6,000 to 8,000 feet above sea-level. Several

thousand bales of it were exported a dozen years ago. But, as the tree was only locally distributed, the source of supply was soon exhausted. The authorities at Kew have named this plant *Sapium biglandulosum*, a species which is also said to be found in British Guiana, where, however, it seems to be of no value as a rubber producer. In connection with the cinchona plantations . . . a plantation of this rubber was made about ten years ago. The trees grew with remarkable rapidity, with trunks a foot in diameter in six years; but this plantation shared the same fate as the cinchonas—that is, it was abandoned years ago because the cinchona was abandoned. With renewed attention, however, this plantation may still be made important.

The Calcutta Tea Season. Reporting on the season that is just at an end, Messrs. Watson, Sibthorp & Co., of Calcutta, remark:—"The past season has been one of the worst the trade has ever gone through, the range of prices, until quite recently, has been most unsatisfactory, due at the commencement of the year to the large stocks in London and as the season went on to the heavy shipments from here during the busy months. Fortunately the low range of prices stimulated consumption so much in all quarters that the demand has now overtaken the supply and since the beginning of this year prices have improved to a very considerable extent, so much so that there is now every reason to hope the new crop will meet with a good reception. The increase in the trade with outside markets is very marked, large orders from various places have been held here all through the season and many of them had unfortunately to remain unfulfilled in consequence of the dearth of suitable teas, if such teas had been available, there is no doubt the increase of shipments to other ports instead of being about five millions lb. would have been much nearer double that quantity and that at a range of prices far above those ruling in London. A comparison of the average prices realised here and at home is quite misleading as here are sold a very large proportion of the poorest teas grown in India, including a lot of dusts and fannings, while nearly all the best teas find their market in London and help to swell the average there."

LETTERS TO THE EDITOR.

THE ADULTERATION OF COFFEE.

Sir,—In your excellent leading article on Adulteration, in your issue of the 4th instant, you seem to me to have made one mistake and that a serious one.

You say that Section 9—"that in connection with the "sale of mixed articles the vendor should supply the pur-"chaser with a label setting forth that the article is "mixed"—meets the wishes of coffee planters.

In my opinion the section does not go far enough and is nearly useless as it stands. What we want is that the actual proportions of coffee and mixture should be stated on the label. In a former crusade against adulteration, a packet called on the outside "French coffee" was bought in a shop and analysed, and was found to contain one per cent. of coffee and 99 per cent. of vegetable refuse. Yet in this case the vendor had done all that was required of him by the section, as he stated on his label, that the coffee was mixed, and the purchaser was left in ignorance of the contents of his packet. But if the actual proportions of the various ingredients were clearly stated on the label, then the consumer could purchase coffee, chicory or roast vegetable refuse according to the dictates of his palate and the coffee producer would have no ground of complaint.

George Romilly.

[Mr. Romilly's letter has reached us too late to permit of reference to the papers from which we learnt the views of the Federation of Grocers' Associations, but we think we may say that though the manifesto, as a mere summary, did not specify that proportions of ingredients should be stated on the labels on mixed articles of food, the more detailed recommendations of various Grocers' Associations were to much the same effect as Mr. Romilly's suggestion. It was in that belief that we wrote the article that appeared in our last issue.—Ed. *P. O.*]

COFFEE CULTIVATION WITHOUT MANURE. MANAGEMENT OF *E. LITHOSPERMA* SHADE. THE BUMPER CROP.

Dear Sir,—The many planters who are now growing *E. lithosperma* shade will no doubt be interested in hearing of the latest results obtained on the original *E. L.* shaded coffee. I hope that some account of my experiments, which have ended successfully, may be interesting to my fellow-planters, and may help them to avoid mistakes that I have made and enable them to arrive at successful results in less time than it has taken me. Before writing further it may not be out of place to record the obituary of Dr. Schultz, of Lupitz, Germany, who may be called the father of soil renovation by means of leguminous crops in Europe. I extract the following from the *Standard* of January 25th: "By the death of Dr. Schultz, of Lupitz, Germany loses an agriculturist of world-wide fame for his practical application of science in agriculture. Dr. Schultz was the first to apply systematically the theory of the nitrogen-accumulating capacity of leguminous plants, a nd this he did before the researches of Hellriegel and Willfa rth had demonstrated the truth of that theory, and distinctly explained it. By growing and ploughing in leguminous crops, principally lupins, at intervals, and applying phosphoric and potassic manures, Dr. Schultz raised the condition of his farm of almost barren sand to a state of considerable fertility. Whereas during the first ten years of his tenure he grew miserably small crops of inferior grain and other produce, he has produced recently 26—32 bushels per acre of rye and six tons of potatoes. At first, rye was the only white-straw crop that could be grown on the land; but for some years good crops of wheat, barley and oats have been produced and sugar beet has been cultivated successfully. The improvement was accomplished *without the feeding of live stock or the application of expensive nitrogenous manures.* [Italics are mine.] Dr. Schultz's fame, as an agriculturist, procured him a seat in the Reichstag in 1887, which he held until his last illness began, in the latter part of last year."

As it was through reading an account of the Lupitz system that coffee cultivation without manure dawned on me as a possibility, I hope the above extract will not be considered irrelevant, for although it is not mentioned in the extract given above, it is a fact that the soil that Dr. Schultz had to work on was so poor that the mineral manures referred to were applied to enable the leguminous crops to grow, and not for the benefit of the succeeding grain crops. An ordinary rabbit-warren would probably be not an unfair definition of the land he took in hand. We have here the record of the successful application of the leguminous theory in a temperate climate, and

I challenge anybody to show cause why it should not similarly be applied in the tropics. There is one difference only as regards coffee estates, and that is that their soils are fortunately not so poverty-stricken as the unpromising soil with which Dr. Schultz had to experiment. In an article that appeared in *P. O.* about last January year—"Soil Renovation"—I gave an analysis of worm-casts which proved that under leguminous shade worm-casts obtained a richness in nitrogen equal to twice that in ordinary worm-casts in meadow land in England. I think this analysis clearly establishes that legumes in the tropics are in no way behind those of the temperate regions in their renovating powers. I have always advocated planting *E. lithosperma* 15 feet apart in the coffee, with the object of securing the maximum loppings and consequent humus, and the maximum of root development and consequent nodule development; as the nodules are the nitrogen traps, it logically follows that the more nodules the greater amount of atmospheric nitrogen is assimilated. I find it best to lop the young trees as high as can be conveniently reached, as they are then in better condition for the after-treatment that I am about to describe, which has given very successful results. As close planting is liable to lead to overshading, a most fatal condition of things for good crops, I recommend felling each alternate line in alternate years, the trees to be felled immediately under the branches which in the first felling would be about 8 feet. The time of the year for felling must, of course, vary in different districts; but in this district, where the bulk of the rain falls in the S. W. monsoon, I find that felling trees from the 20th July to 20th August gives the best results. Leaf Disease generally shows up fairly about the end of July, and when that happens then is the time to fell. It has a wonderful effect, as the coffee immediately starts growing, and throws off leaf-disease in a marvellous way. I have found felling in the way I have described far more efficacious than any thinning and lopping; I believe the reason is the following: When the trees are felled they at their maximum foliage development, and also the maximum nodule development. By felling there is naturally a great check given to the tree, and enormous quantities of rootlets covered with nitrogen-charged nodules decay in the soil immediately, thus acting as a powerful and efficacious manure for the coffee. In thinning the shade there is not the same check to the tree, and the rootlets and nodules instead of being diverted for the benefit of the coffee, continue to feed the parent tree. I think this is the explanation of the difference in effect on the coffee between thinning and felling. As this treatment may seem somewhat drastic, I may add that the shade trees grow again readily and by the following twelve months have made an average growth of 15 feet. A number of trees that I have felled for the second time with only their twelve-months growth on them are growing again with unabated vigour. As this is far more severe treatment than they would be subjected to in the alternate year system there seems no reason why they should not be permanently so treated. In reference to results the following simple figures will prove at a glance what *E. lithosperma* has done for the coffee.

Crop in 1889 just under 2 cwts. an acre.

Crop in 1898 just over 7 cwts. an acre.

Coast outturn 1889 crop 6—40 bushels parchment per cwt.

Coast outturn 1898 crop 4—83 bushels per cwt.

The true significance of these figures will be better appreciated in comparison with other coffee in the district. Within a 20-mile radius of this it is doubtful whether any surviving coffee has given 7 bushels an acre.

The 1898 crop was very much handicapped by the weather or it would have been much larger. The blossom was brought out on the 19th February by a local thunderstorm, and March and April were absolutely rainless, and never more than ½ inch of rain fell at a time till the end of May. As a result of the abnormal drought many of the trees lost from half to three-quarters of their crop and doubtless the outturn was also prejudicially affected.

As to cost of cultivation, although I have advocated in the early stages burying all the loppings and thinnings green, yet as the shade trees grow older and earthworms work the soil freely there is no necessity for burying anything. When as in my case I applied castor poonac without any effect on the coffee, it is clear that there is no need to bury the loppings to get the nitrogen, the soil having been enriched to such an extent by natural agencies through the annual decay of the rootlets, leaves and loppings, etc., that the loppings may safely be left on the ground as a mulch; they will gradually on decay yield up their mineral constituents, and no inconsiderable portion of the nitrogen will be stored in the ground through the action of earthworms and other earth-dwelling creatures.

In my own case I have never buried the loppings, and yet the accumulation of nitrogen has been so great that the worm-casts analysed ·83 nitrogen against say ·45 of ordinary cattle manure, and as the worm-casts are produced at a greater weight per acre than cattle manure is ordinarily applied, the necessity for cattle manure as an adjunct to coffee cultivation is not obvious. At any rate, leguminous shade and worms can give it a good many points and a beating. The cost of felling and lopping the shade trees may from my exprience be safely calculated at not exceeding Rs.2-8-0 per acre, and this with probably the most inefficient labour in S. India and as weeds do not flourish under this system of cultivation the cost of felling, *i.e.*, MANURING, and weeding does not exceed Rs.10-0-0 per acre per annum.

I say nothing about the cost of other works, as all planters can estimate the cost for themselves. The reduction of the important item manure to Rs.2-8-0 an acre would mean a great difference in the expenditure and would prevent a good many places being swamped in the impending storm. There are three evils from which coffee planting in India at present suffers, low prices, plant diseases, and a "token" currency. The first two are unavoidable, and the third unjustifiable. I don't suppose any planter for even a moment supposes that the Currency Committee is likely to render justice to India. If there are any, they have only to recall the circumstances under which the Committee was created and the protests evoked from the Governor of the Bank of England and leading business circles. The Secretary of State for India is the Creator of the Committee, and as for the Secretary of State's opinions here they are in a nutshell. I quote from a speech in the *Standard* of January 26th: "By the automatic influence of good trade "and a high exchange, the currency difficulty was solving "itself, and he trusted we were within measurable distance of "an effective gold standard, which, if once established, would "be of incalculable benefit in *promoting India's power of* "*production.*" The higher exchange is, the less the producer gets for his produce; therefore the less the producer gets for his produce the more India's power of production will be promoted is the only reasonable deduction to be derived from

his words. This is what our old friend Euclid calls a "*reductio ad absurdum*," and it is perfectly clear that logic formed no part of the Secretary of State's education.

To assume that the Secretary of State for India has any intimate acquaintance with India would be superfluous, but surely he cannot be ignorant of the effect the low price wheat has had on wheat growing in the U. K. Has the power of production been promoted? Why should lower prices for produce have a different effect in India than England? I should think there cannot be the slightest doubt that we shall have to work in future with a 1*s.* 4*d.* rupee, and to enable that to be done in many places successfully the cost of production must be reduced, and I don't know of any easier way of doing it than by the aid of legumes.

Why should there be any need to purchase any nitrogenous manures when the atmosphere can be drawn on for an unlimited amount? and with the aid of a suitable tree like *E. lithosperma* vast amounts of the mineral constituents needed by coffee can be drawn from depths far below the coffee roots.

In concluding the final article on "coffee cultivation without manure," I should like to express my high appreciation of the great interest taken in it by a large number of planters, and the hope that they may meet with a still larger measure of success than I have.

B. Nelson.

[The length of the above very interesting letter deters us from commenting on it, or on the subject it touches upon, in our present issue. We shall revert to the matter later, and we trust that some among our readers will also favor us with remarks or criticism, so that a very important question may be fully discussed.—*Ed. P. O.*]

GENERAL ARTICLES.

CEYLON TEA AVERAGES, 1898.

The *Times of Ceylon* gives the following comparative figures, showing the prices realised for the last four years for teas off a number of well-known and representative properties in various parts of the planting districts. All these teas were sold locally, not in the London market. The prices are in cents.

AMMONIA IN RAIN-WATER.

Referring to a letter in the *Ceylon Observer*, in which it was mentioned that, in his analysis of rain water collected on Meeriabedde estate, between November 16th, 1883, and March 6th, 1884, the ammonia from 90 inches was equal to 87 lb. per acre, Mr. John Hughes has submitted his *full* report, with the remark that he had previously drawn attention to the figures as being unusually high and much above what he had found in rain-water collected by Mr. G. Walker at Bogawantalawa. The report is old, but we give it nevertheless. It reads as follows:—

Analytical Laboratory 79, Mark Lane, London, E.C.,
No. 1. June 12th, 1884.

Rain water received in a stone jar case with wicker collected on Meeriabedde, Koslanda, Ceylon, between November 16th, 1883, and March 6th, 1884, and supposed to represent the 20·81 inches of rain registered between the above dates.

An imperial gallon was found to yield on evaporation, solid residue dried at 110° c= 5·74 grains consisting of:—

Organic and Volatile Matters	1·12
Mineral Matters	4·62
Total ...	5·74

Also by direct determination—

	Per Gallon. Grains.		Per acre for every inch of rain.
Free Ammonia	·291		
Albuminoid Ammonia ...	·008		
	·299	equal to	lb. ·966
Nitric Acid	·510	„	1·648
Sulphuric Acid	2·307	„	7·458
Chlorin	·397	„	1·283
Equal to Chloride of Sodium	·654	„	2·114
Lime	1·332	„	4·306
Magnesia	·100	„	·323

Assuming that the average annual rainfall on the estate to be 90 inches—the total quantity of ammonia from the above results would amount to 87 lbs. in round numbers, and the Nitric Acid to as much as 148 lbs.

The figures are so very high, and so much above what was found in the rain water collected by Mr. Walker, of Bagawantalawa and reported on last November, that it would be desirable to make enquiry respecting the manner in which this particular sample was collected and stored between the 16th November, 1883, and 6th March, 1884.

From the accompanying Table of Rainfall,* it will be noticed that the total of 20·81 inches extends over 42 days and has been made up by numerous showers, most of which are less than half inch; in only six instances did the quantity exceed one inch per day, and in these it varied from 1·35 to 3·62 inches. Doubtless the rain yielded by these showers does contain a much larger proportion of Ammonia and Nitric Acid to that found in water representing a heavy storm of from 3 to 6 or more inches of rain, but it would be desirable to make enquiries as suggested, especially as the relatively large quantity of Mineral matters found on evaporation, leads me to conclude that some impurities had become accidentally introduced.

For sending samples of water, clean white glass spirit bottles well corked are always to be preferred to stone jars.—John Hughes, F.C.S., Fellow of the Institute of Chemistry.

Surely this is a matter that deserves further investigation at the present time—in India as well as in Ceylon?

[* We do not consider it necessary to publish this.]

CINCHONA CONTENT AND THE GERMAN FACTORIES.

It was, perhaps, somewhat rash on our part to undertake the terrible amount of research that has been necessary to say with anything like confidence what is a fair average percentage of alka-

oidal content in the bark which has entered Germany during the last ew years. Even after comparing extensive series of analyses that ave been made officially in Java and British India, and availing ourselves of the kind assistance of Mr. David Howard, we feel that ur figures ought to be placed before readers with explanations of he way they have been arrived at, so that they shall not bear an ppearance of absolute precision. Commercial men, however, will e satisfied by a very brief statement of these, and as our object has een mainly to show that although confessedly the 5 per cent. *uinine* average we allowed in the bark imported into Germany as too high, it was not so much too high an *alkaloidal* figure as to hrow doubt on the official Government figures of the imports of ark and exports of quinine.

We threw out a suggestion last week that several correspondents ad been misled through ignoring altogether the content of alkaloid n bark other than quinine. On the other hand, the laboratory man might make a mistake in the other direction by looking upon the whole of the alkaloid in the bark as so much merchantable product. To avoid both mistakes, we have employed in our inquiries, and also in what follows, the term "available alkaloid" to express all that can be extracted from the bark and sold. This will, as a practical result, almost resolve itself into calculating the amount of quinine and cinchonidine in the bark, and that, though subjected to checks by us, is very nearly the principle followed in our calculations.

The matter then stands thus: We sent to Germany and Holland in 1893-8 (inclusive) about 7,360 tons out of a total of 21,121 tons that Germany received altogether, most of the rest of her imports being from Java, through Holland, or direct. The bark we sent her had amongst it about 3,706 tons of Indian, 2,465 tons of Ceylon, 602 tons of African, 238 tons of Javanese, and 370 tons of South American, assuming that we sent her supplies of these barks in the same proportion as we received them. Now, if trustworthy analyses of a comprehensive character of all these barks had been published, it would be comparatively easy to calculate how much available alkaloid Germany has obtained through England; and the Java bark content presents little difficulty in this way. But we have to gather our figures for the "English" bark from all sorts of sources. Taking the East Indian as one that has been subjected to independent analyses of a fairly extensive character, and neglecting such of these as are abnormal, we note that Hooper in 1894-95 speaks of bark which had a quinine sulphate yield of 3·94 per cent. and a content besides 0·71 per cent. cinchonidine, ·13 per cent. quinidine, and ·52 cinchonine as being of the average composition of officinalis bark. Again, the average quinine sulphate yield of all crown bark ground up at one of the Government factories in India during 1889-97 was 3·6 per cent. We have spoken of the yield partly because—and this is important to note—the factory results agreed well with the laboratory analyses. These analyses give much higher content than what was obtained, for instance, by Messrs. Boehringer and Sœhne from East Indian bark a few years previously (1888-1889 and 1890). But they cover years which we are now noting, and are of a comprehensive character.

Following the same plan with red bark, we note that Hooper, in 50 specimens, found an average of 1·40 per cent. quinine (*not* sulphate), 2·25 per cent. cinchonidine, 1·92 per cent. cinchonine. A corresponding analysis of crown bark gave 2·93 per cent. of quinine (*not* sulphate), and 1·40 of cinchonidine, besides other alkaloids. Red bark, whether from Java, Ceylon, India, or Africa, does not differ much. In the case of the South American barks, the percentage now a days is not important as a commercial problem, but Germany has taken large amounts of quinine from cultivated calisaya bark during the last 10 years, and she has found it to average pretty well 4½ per cent. of quinine sulphate, containing little else.

These figures and others which we have in our possession lead us to think that if we allow 4½ per cent. as an amount of "available alkaloid" in the bark Germany has obtained from England during the last six years. 5½ per cent. of quinine sulphate in all the bark she has obtained elsewhere, and in addition to the latter 2¼ per cent. of cinchonidine from the red bark she has obtained from Java (and not through us), we shall form a fair estimate of the total available alkaloid that Germany has purchased during that period. This would give a purchase of 1,113 tons of alkaloid. The export for the six years was 1,082 tons, leaving about 31 tons (and the residue of former years) for home consumption during these six years, and for stock at the end of 1898.—*British and Colonial Druggist.*

BONE-MEAL AS MANURE.

There are, observes *Indian Gardening*, few substances known to agri-horticulturists and used as manure, about the value of which there is such diversity of opinion as bone-meal or bone-dust. We do not think this difference of opinion is so pronounced among European and American authorities as it is in India. In the early issues of this journal we endeavoured to combat the opinions of Dr. Leather and one or two Bengali officers of the local Department of Agriculture, who maintained that bone-meal had very little manurial value, and that the enormous export of bones from this country, which was then, and is now, taking place, did not affect the fertility of the Indian soil in the least—agriculturally. We expressed exactly the contrary opinion, and we contend that we are right. Mere assertion, however, is of little value without corroborative evidence.

Attention was directed to the large exports of bones from India so far back as 1889 (vide *Pioneer* of 14th September, 1889), when it was stated that in the previous year the exports of bones had been unusually large, having been 35,500 tons, valued at 17½ lakhs of rupees. The shipments for the five years ending 1887-88 had averaged 22,600 tons, valued at 10¾ lakhs of rupees. The *Pioneer*, in referring to these figures, said:—"These increasing exports are not a matter for congratulation so far as India is concerned." Mr. G. M. Woodrow, Professor in the College of Science, Poona, and at present Director of the Botanical Survey of Western India, who is a recognized authority as an agri-horticulturist, wrote in 1889:—"The subject of bone-crushing is of extreme importance for the agricultural advancement of this country, because, as is well known, bones contain, weight for weight, 17 times as much valuable manure as good cowdung, while the selling price of bones uncrushed in this district is not more than three times the price of cowdung. It is also well known that there is no special deposit of phosphatic mineral available for manure in the Bombay Presidency; yet Bombay exported to British ports in 1884 bones for manure to the value of £99,000. If this continues many years the result will be a serious diminution of the small proportion of phosphates existing in our soils, and consequent exhaustion and sterility; but the obvious remedy is to crush the bones and return them as manure to the soil they came from." Compare this with the opinion of Dr. Leather (vide *Indian Gardening*, 30th September 1897), in which he said that until it is found that bones are of *considerable* value to some particular crop in India, "it can hardly be said that their export constitutes any serious loss to the ryot."

The export of bones from India has been on the increase every year since attention was drawn to the subject ten yeare ago. India's loss is the gain of other countries. Gardeners and farmers on the continent and in America recognize the value of bone manure, for the garden as well as for the farm; and there is a large demand for bone-meal. It is well known to gardeners that bone-meal is a valuable fertilizer for a large number of plants, especially those cultivated in pots. Mere chemical analysis of a substance does not go to show that it is of more or less *manurial* or nutritive value. For instance, analysis of the seeds of *Indigofera cordifolia* (to which reference is made in another place) showed that it contained 35·21 per cent. of albuminates against 25·06 per cent. in pulses and 9·12 per cent. in cereals; yet its *nutritive value*, as compared with cereals and pulses, is given by Professor A. H. Church, of the Imperial Institute, London, as 79 against 100 for cereals and pulses. No matter what the analysis may be, it is found by practical experience that bone-meal is of value to the gardener, whether used in the pure state or in the form of superphosphate. It is therefore satisfactory to find that bone-mills have been established in the neighbourhood of Calcutta, which may be expected to do a considerable trade in this valuable soil fertilizer, in India as well as out of it, but we would prefer to see the trade extended in India. From long experience in the garden, we can confidently recommend bone-meal to our readers as a most valuable fertilizer; plants as a rule are benefited by the application of it. Pot plants, especially, show their appreciation of it. The difficulty hitherto has been to obtain bone-meal in assimilable form; and to those who desire to use this valuable manure, we recommend them to apply to the Bally Bone Mills, the Calcutta Agents for which are Messrs. Ewing and Co., of 7/1, Lyon's Range. We have had samples of their manufacture sent to us for in-

spection, and they are excellent, being in various stages of fineness, from the coarse stuff fit for the field, to the fine flour for pot plants. The Magra Bone Mills, also of Calcutta, exhibited samples of their manufacture at the recent Agri-Horticultural Show, and they also turn out the several grades of meal. We have already noticed these in a previous issue. We have only to warn the Government and the trade that foreign countries are offering inducements to Indian houses to export bones in large quantities; and that unless some means are adopted to check these exports, India will within a short time, as pointed out by Professor Woodrow, be denuded of the "small proportion of phosphates existing in our soils."

BOARD OF TRADE RETURNS.

January, 1899:—A summary of the various entries of articles *imported* into the United Kingdom during January, amongst other facts, represents—

Cocoa (raw) as in but scanty supply, concurrently with increasing deliveries and a rapidly diminishing stock.

In the first month.		1899.	1898.	1897.

STRAY NOTES ON MANURES.

Why Lime is Valuable as a Fertilizer.—In soils deficient in lime, applications of lime are necessary to supply plant food. The indirect value of lime is perhaps more important than its direct action. It unlocks unavailable potash, phosphoric acid and nitrogen of the soil. It also exerts a decided influence on the mechanical conditions of soils. Compact soils are made light, and loose soils are made more compact. It also furnishes conditions in the soil favorable to the activity of micro-organisms which convert the nitrogen of organic matter into nitrates and thus makes it available as plant food. On soils that are sour, lime is valuable in neutralizing the acidity.

MANURING OF TROPICAL PLANTS.

(*Continued from issue of 11th February* 1899.)

(ii.) Phosphatic fertilisers.

1. Phosphoric acid, soluble in water—as furnished in acid phosphate, containing 14 to 21 per cent. phosphoric acid—is the most assimilable form for this plant-food ingredient. The acid phosphate is manufactured by decomposing slowly soluble crude phosphates by means of sulphuric acid. When liquid phosphoric acid is empl oyed to decompose the crude phosphates, we obtain so-called double superphosphate, containing 35 to 45 per cent. of phosphoric acid, soluble in water. The latter material should be used wherever fertilisers have to be brought from a distance, as its cost is but little higher, and the freight charges only half as much.

2. The phosphoric acid contained in Thomas' slag is not soluble in water, but is very effective, so that we are correct when we say that the phosphoric acid is soluble in the soil. Experiments conducted by Prof. Wagner, Darmstadt, Prof. Maercker, Halle a.S. and others, have proven that the phosphoric acid soluble in a given solution of citric acid produces the same effect as that soluble in water. However, as the solubility in citric acid of the different slags varies from 30 to 90 per cent. of the total phosphoric acid, the consumer should purchase a high grade Thomas slag, i.e., one containing the highest possible percentage of phosphoric acid soluble in citric acid.

In addition to this quick-acting phosphoric acid, Thomas' slag also contains some that is dissolved slowly, the effects of which are even felt after some time; this fact is of especial importance in the case of arboreous plants.

Another beneficial effect is produced by the high percentage (30 to 50 per cent.) of lime contained in Thomas' slag, a matter which is especially worthy of consideration with soils deficient in this ingredient.

3. Bone-meal (steamed bones) is very slowly decomposed in the soil, and, according to the latest investigations, produces a much less marked effect than Thomas' slag, though formerly the contrary was believed to be the case. Steamed bone meal is, therefore, used only when it is intended to enrich the soil permanently. Bone-meal is decomposed in the same manner as acid phosphate, in order that the phosphoric acid it contains may be made available in the form of water soluble phosphoric acid.

(iii.) Potassic Fertilisers.

The potash contained in the ashes of plants is a very good source of this ingredient. However, ashes are placed upon the market in such limited quantities that they do not require special attention except in rare instances. The principal sources of potash, which is one of the essential plant-food ingredients, are the Stassfurt potash salts; these are placed upon the market in the following forms:—

1 Crude potash salts, being the natural products of the mines. These are furnished in a finely ground state as carnallit, kainit, and sylvinit. In addition to muriate or sulphate of potash, they contain magnesia salts and chloride of sodium (common salt); these latter, however, as a rule, possess but little value for plant nutrition.

The acids (muriatic and sulphuric) must first be converted in the soil with the aid of lime, and, together with the by-products, worked into the deeper layers, in order that the crude salts may be made available. The effect of the crude potash salts, is, therefore, primarily shown in changing the condition of the top soil. The salts absorb moisture from the air, and thereby make the soil moist and compact; this is very valuable in the case of light dry soils, less so in the case of heavy soils. Great caution should be exercised in the application of crude salts to sensitive plants; they injure the burning quality of tobacco and decrease the percentage of sugar in sugar-cane.

On the other hand, crude salt should be applied to plants that consume large quantities of salt, such as cocoanuts; also when it is desired to combat large insects-pests, as in cotton. The crude potash salts are preferable to common salt for this purpose, as they supply at the same time one of the essential plant-food ingredients, thus serving a double purpose. When the products have to be procured from a distance, kainit, sylvinit—the latter, as a rule, contains the larger percentage of potash—are preferable to carnallit, as the last-mentioned salt is not only poorer in potash but very readily absorbs moisture. However, as a rule, the application of refined potash salts is more advantageous, as they are much purer and contain a larger percentage of potash (four to five times as large). On account of the high freight charges to the colonies, the 1-lb. of pure potash is cheaper in the refined than in the crude salts.

2. The sulphates, such as sulphate of potash and sulphate of potash-magnesia, have been successfully applied to all plants especially to those in which the quality of the yield is of prime importance, *e.g.*, tobacco, sugar-cane, tea, pine-apples, and oranges.

3. In all other cases muriate of potash should be employed; it offers the advantage of being somewhat cheaper than the sulphates, while the effect is the same, especially as regards the quantity of the yield.

4. Carbonate of potash-magnesia does not contain any chlorine or sulphur, thus bringing the potash to the plants in a directly available form. This fact is of importance in the case of delicate plants or such as require large amounts of potash during the primary stage of growth.

(iv.) Fertilisers containing two or three Plant-food Ingredients.

1. Nitrate of potash is obtained from East India under the name of "Bengal saltpetre;" it can also be manufactured by converting muriate of potash and nitrate of soda, and the manufactured product is considerably purer and of higher grade. Nitrate of potash contains both nitrogen and potash, is comparatively pure, but rather expensive.

2. Peruvian guano, fish guano, and tankage contain chiefly nitrogen and phosphoric acid; they, therefore, require an addition of potash in order to produce good effects.

(v.) Calcareous Fertilisers.

According to Prof. Maercker, a soil containing less than 0·25 per cent. of lime will always respond favourably to lime fertilisation; one containing from 0·25 per cent. to 0·5 per cent. will probably do so, and the application of lime has produced good results even on soils containing more than 0·5 per cent. of this material.

A sufficient supply of lime in the soil is of the utmost importance as it not only is a valuable plant-food ingredient, but also improves the physical condition of the soil. Should the soil be deficient in lime, the planter should not fail to supply this ingredient, artificially.

Sour and heavy soils are neutralised and loosened by lime, and are thus more easily worked, and produce better yields. Furthermore, lime hastens the process of decomposition going on within the soil, causing the more rapid conversion of humus into carbonic acid, and accelerating the formation of nitrate. Lime is of much importance in assisting in the decomposition of potash salts, but this action will deplete the soil of its supply of lime; 220 lb. of potash salts convert and force into the lower depths of the soil about an equal quantity of lime.

Among calcareous fertilisers the following deserve mention:

1. Marl, which contains from 10 to 70 per cent. of carbonate of lime, according to the nature of the substance, so that the amount of marl required depends upon the percentage of carbonate of lime it contains. In order that lime may produce the best effect, 2,000 lb. of lime must be applied to the acre. Recently, finely ground limestone has been applied with success to light soils.

2. Freshly burnt lime consists of quicklime which absorbs moisture from the atmosphere and then falls to a fine powder. The material acts much more vigorously in the soil than carbonate of lime, and is, therefore, to be preferred, especially on heavy soils. 2,000 lb. to 35,000 lb. of slaked lime will satisfy the needs of the soil for from four to eight years. In the case of light soils, it is more advantageous to apply smaller quantities at shorter intervals.

3. Plaster or sulphate of lime does not produce a very favourable effect upon the soil. As this material only dissolves certain plant-food ingredients in the soil, it is only natural that its application should be but temporarily or partially successful.

Tables giving the Composition of the most important Fertilising materials.

	Name of Material.	Nitrogen.	Phosphoric Acid.	Potash.	Organic Matter.	Water.

TEA CULTURE IN ASSAM.

The Report for the year 1897–98 published by the Assam Administration shews, says *Capital*, "That the total number of gardens in the province at the close of the year 1897 was 822, being an increase of 22 gardens as compared with the previous year; 27 new gardens were opened, but after allowing for those closed or removed, amalgamated with other gardens or abandoned, the nett increase is 23, of which 2 are in the Sylhet District, 6 in Kamrup, 3 in Durrang, 5 in Sibsagar and 7 in Lakhimpur Districts. Cachar and the Sylhet districts have the largest number of gardens at present, but considerable extensions of the area under tea and the number of gardens in the Sibsagar and Lakhimpur Districts continue to be made, there being now 171 gardens in the former and 149 gardens in the latter district."

The following are the principal extensions of the total area of the tea gardens during the year:—

Sylhet	31,223 acres.
Sibsagar	1,125 „
Lakhimpur	16,031 „

the nett increase after allowing for small reductions in other districts being 45,122 acres. The figures, however, for the Sylhet district, which are compiled from the Managers' returns, must, it is noted, be accepted with some reserve. The total area of all lands held by tea planters at the close of 1897 was 1,136,261 acres.

The following gives the total area under mature and immature plants during the past six years:—

	Under mature plants. Acres.	Under immature plants. Acres.	Total. Acres.
1892 ...	213,525	33,667	1,044.984
1893 ...	221,368	35,257	1,042,277
1894 ...	229,316	39,480	1,054,992
1895 ...	234,909	41,105	995,787
1896 ...	247,655	44,254	968,895
1897 ...	263,213	47,337	1,014,017

The extensions under the actual cultivation of tea during the year were principally as follows:—

Sylhet District	3,744 acres.
Durrang District	2,117 „
Sibsagar District	3,939 „
Lakhimpur	7,408 „

the total extension allowing for small extensions in other districts being 18,641 acres as compared with 15,895 in 1896. The increase was due partly to the opening of new gardens and partly to extensions in existing tea estates. The total yield for the whole province was 107,266,332 lbs. as compared with 109,727,359 in 1896, but the year's crop was on the whole a poor one chiefly owing to unfavourable weather and sickness among the labour force.

The yield per acre was as follows:—

	1896.	1897.
Surma Valley	460 lbs.	440 lbs.
Brahmaputra Valley ...	431 „	384 „
Whole province	443 „	408 „

These figures differ slightly from the figures given by the Indian Tea Association.

No reliable information was obtained under the head of prices from the Deputy Commissioners, but the figures furnished by the Indian Tea Association indicate that the prices were lower for both valleys than in 1896:—

	1896. As. P.	1897. As. P.
Surma Valley Teas ...	6 10	5 11
Brahmaputra Valley Teas...	8 3	7 8

TEA, &c., COMPANIES.

The Rayigam Company, Limited.—A Meeting of the Shareholders in this Company was held at Colombo on the 1st instant, Mr. Albert Rosling in the Chair.

The Chairman speaking on the annual report which was taken as read, said that the pluckings had been poor in the latter part of the year, so much so that after October, it was plainly seen that they would be short of their estimates. Of Pará rubber 6,000 young plants had been put out and some of the older ones ought now to commence giving seed. They had also completed the manuring of the two estates, and hoped to commence another round of it this year beginning with 100 acres of the older tea on Rayigam.

The report stated:—

Rayigam. Acreage:	acres.	Annandale.	acres.
Tea in bearing	... 362	Tea in bearing	... 274
„ partial do	... 264	Forest and Grass	... 22
„ not in bearing	... 69½		
Forest	... 504½		
Total	... 1,200	Total	... 296

After writing off R4,818·21 for depreciation on buildings and machinery, there remains a balance of R14,543·76 available for distribution. The Directors propose to write off R1,319·11, being one-fourth of the original preliminary expenses, and to pay a dividend of 2 per cent, which will absorb R12,000, carrying forward a balance of R1,224·65. The crop of tea was 206,269 lb. from Rayigam, of which 50,400 lb. were shipped to London and sold at an average of 5¾d. per lb., while the bulk of the crop was sold locally averaging 32·20 cents per lb. The crop was 8,731 lb. less than was anticipated, entirely owing to the unfavorable weather during November and December. The crop of tea from Annandale was 76,314 lb. of which a small portion was sold in London at an average of 7¼d, and the balance locally at 47·40 cents per lb. The crop on this

estate was 3,686 lb. less than estimate, also due to the unfavorable weather prevailing during the last two months of the year. Of the 20 acres proposed to be opened last year, 18½ acres have been cleared and planted. It is not intended to make further extensions during the present year. The estimate of crop for the current year is 250,000 lb. from Rayigam and 82,000 lb. from Annandale. Owing to the small amount available for a dividend, the Directors have agreed to waive their fees. The dividend was agreed to.

The Ceylon Provincial Estates Company, Limited.—The Fourth ordinary General Meeting of the shareholders of this Company was held at Colombo on the 3rd inst, Mr. F. L. Clements presided.

The report stated:—

The tea crop amounted to 430,951 lbs. against an estimate of 425,000 lbs. for the year, which may be regarded as a satisfactory result, seeing that the season was not altogether a favourable one for the growth of leaf. The total profit for the year was R76,371·16. The cost of producing the tea and bringing it to market works out at 26·10 cents per lb. against 29·25 cents last year, and the expenditure includes a sum equal to 1½ cents a lb. for manuring operations. The average nett selling price of the teas, on the other hand, shows a falling off from 1897, the rates being 42·73 cents and 45⅜ cents per lb. respectively. The clear profit resulting from the season's working, after providing for interest on mortgages, &c., amounts to R60,661·19, out of which an interim dividend of 3 per cent has been paid to the shareholders, and the Directors now recommend the payment of a final dividend of 4½ per cent. on the paid-up capital, making 7½ per cent. for the year. The interim and closing dividends together account for a sum of R42,950, and, after providing for Directors' fees, it is proposed to apply the surplus to part-payment of the expenditure which has been incurred during the year on permanent works not chargeable to revenue. This expenditure amounts to R28,166·76, and includes the cost of completing the factory on Brownlow and nearly all the necessary outlay in connection with the new works on Aadneven, together with the upkeep of land not yet in bearing on the two estates. The estimates of expenditure for 1899 are again based on a crop of 425,000 lbs. of made tea, there being hardly any young land coming in, and the f.o.b. rate works out at 27·36 cents a lb., including the cost of manuring 180 acres of tea.

A final dividend of 4½ per cent. is to be paid, making 7½ per cent. for the year, and of a sum of R1,500 of to the Directors as remuneration for the services during their past year, was authorized.

The Soom Tea Co., Ld.—The annual report says:—The teas were as usual shipped for sale to the London market, and we have been advised of the disposal of 100,400 lbs. at 9⅛d. per lb. which in consequence of the high exchange rates ruling during the past year, equals annas 7-9 per lb. nett only in Calcutta, as compared with 9 1/16d. or annas 9-6 per lb. nett for 83,600 lbs. sold to the same date last year. The quality of the produce was in common with the general bulk of Darjeeling teas somewhat disappointing and we can only trust that better quality will be produced during the coming season. The total outlay for the year was Rs.55,246-1-3, as, compared with the original estimate of Rs.55,400, and the following is a summary of the season's working:—

Expenditure.					
On Garden	Rs.	42,785	0	0	
In Calcutta	„	12,461	1	3	
					55,246 1 3
Revenue.					
Nett proceeds of 84,450 lbs. tea sold in London	Rs.	41,454	2	5	
Estimate proceeds of 15,950 lbs. tea sold as per telegraphic advice ...	„	7,178	0	0	
Estimated proceeds of 6,630 lbs. tea supplied to London	„	3,092	0	0	
Proceeds of 100 lbs. tea sold at Factory	„	125	0	0	
Interest on Government Securities ...	„	681	12	4	
Miscellaneous Receipts at Garden ...	„	1,280	6	0	
					53,811 4 9
Loss on season's working ...Rs.					1,434 12 6

After adjusting this account and transferring the above loss, there remains a balance at debit of Rs.2,857-4-4.

Kurseong and Darjeeling Tea Co., Ld.—The Directors state:—We regret to say the manager's anticipation of a yield of 1,000 mds. of tea for the season, as stated in his report of February 1898, has not been realised. The total yield for the season was 58,125 lbs. tea and the average price realised As. 7-6 per lb. The quality of the tea from the Darjeeling district was again not up to the standard, probably from climatic causes; but the lower average is due chiefly to the very low prices that have ruled for tea through the year. The result of the season's working is a loss of Rs.3,214-1-4. The garden is among the oldest in the district, consequently the soil is more or less impoverished. Unlike Cachar and Assam there are no *bheels* at hand from which soil can be put on for mixing with the old soil; while the freight on ordinary manures, as crushed bones, makes their use almost prohibitory. Taking into account the yield for the last few years the estimated yield for 1899 is taken as 400 mds. or 72,000 lbs. tea—

	Rs.	As.	P.
The garden expenditure	26,038	4	0
Calcutta agency, stores, freight on tea, &c ...	8,000	0	0
	34,038	4	0

Kandyan Hills Company, Limited.—The Annual General Meeting of shareholders of the Kandyan Hills Company, Limited, was held at Colombo on 4th instant, Mr F. Macindoe presided.

The report stated:—

Acreage.	
Tea in full bearing	320 acres
Tea 2½ years old	32 „
Tea planted 1897	58 „
	410 acre
Cacao	90 „
Reserve land...	810 „
	1,310 acres

The crop amounted to 107,405 lb. of made tea and cwt. 150·0·27 of cocoa. The former was produced and placed in the market at the rate of cts. 30·95 per lb., including the cost of manuring 60 acres of the tea and realized a nett average of cts. 36·23 per lb. The cocoa crop represented an expenditure of R27·75 per cwt., and sold at R43·20 per cwt. in Colombo.

Notwithstanding the short out-put of tea, which is explained in the Report as being due to the effects of a very unfavourable season, a considerable saving has been effected in the cost of placing the tea on the market, while the selling rates shew a distinct improvement on those of the previous year. Instead, therefore, of only a profit of R237·28 on the working as was the case last year, there is a profit of R8,009·86, which under the circumstances may be regarded as a fairly satisfactory result and shews that things are improving. Interest charges on money advanced for further developing the property, however, are heavy, and after carrying forward last year's balance, there is still a sum of R6,957·76 to debit of profit and loss account, which it is proposed to carry over to the new season. The estimates for 1899 point to a yield of 130,000 lb. of made tea costing 28 cts. a lb. in Colombo and 130 cwt. of cocoa.

To place the Company on a better financial basis, it is proposed to issue Preference Shares bearing interest at the rate of seven per cent. per annum, and to be preferential both as regards interest and capital for the purpose of paying off the existing debts to the National Bank of India, Limited, and the agents on which interest is running at current rates.

Tonacombe Estates Company, Limited.—The fifth general meeting of Shareholders of the Tonacombe Estates Company, Limited, was held at Ambewatte House, Slave Island, on 11th instant:—Mr. W. H. Figg (Chairman), presided.

The report stated:—The total quantity of tea secured was 190,073 lb., which has been sold at an average of 41·49 cents per lb. net. The total cardamom crop was 7,379 lbs., which have realized Rs2·01 per lb. net. Of cinchona bark 17,628 lbs. have harvested and sold for Rs1,718,73. The total expenditure on working account amounted to Rs61,232·17. The balance available after providing for depreciation is Rs20,841·34, and the Directors propose to pay a dividend for the year at the rate of 5 per cent. absorbing Rs14,000, to place Rs6,500 to credit of extensions account, and to carry forward Rs341·34 to next account. The debenture issue of £7,000 is repayable on 31st December 1901, and the Directors are of opinion that it is desirable to redeem them, if possible, on that date Under any circumstances they do not think it expedient to attempt to pay a larger dividend than 5 per cent. per annum before that date. The crops of 1899 are estimated at 210,000 lbs. Tea 8,000 lbs. Cardamoms against an expenditure of Rs64,485·50.

DISTRICT ASSOCIATIONS.

SHEVAROY.

Proceedings of a Meeting of the Committee of the Shevaroy Planters Association, held in the Victoria Rooms on Monday, the 6th March 1899, at 1 p.m.—PRESENT: Messrs. Thurston Short, J. W. Large, C. G. Lechler, S. M. Hight, Rev. J. M. Kempf; Mr. R. Gompertz, *Honorary Secretary.*

1. *Read* correspondence which has passed about the resolution of the Government of India on the report of the S. I. P. E. C.

Resolved that if Section 19 of the Fugitive Offenders' Act of 1881 (44 & 45 Vic. c. 69) is to be incorporated in the draft of the proposed new labour bill, and the Magistrates be given power to discharge an offender, instead of sending him to the place where the offence occurred, to stand his trial there, this Association considers it absolutely necessary in the interests of justice that his discharge should always be conditional on his paying into Court any advances which may be due to the complainant, together with the costs of the case.

2. *Read* letter from Honorary Secretary, South Mysore Association, to the Secretary U. P. A. S. I.

Resolved that this Association approves of the letter in question, particularly of the suggestion that when the Magistrates accept bail they should be bound to satisfy themselves that the security offered is substantial.

3. *Read* copy of letter from the Chairman, Mr. Romilly, to the Hon'ble Mr. Hodgson, dated 2nd ultimo.

Resolved that this Association approves of the suggestions of the Chairman, U. P. A. S. I., as set forth in above letter:—

Read and *Recorded* the following letters:—

17/U. W. Circular from the U. P. A. S. I., requesting to be favoured with an expression of opinion upon the resolution of the Government of India regarding the report of S. I. P. Enquiry Committee, and (2) copy of a letter from the Chairman to the planting member of the Legislative Council.

18/U. W. Circular from the Secretary, U. P. A. S. I., regarding the cultivation of tea in India.

19/U. W. Circular from the Secretary, U. P. A. S. I., with copy of letter written by the Hon'ble Mr. H. P. Hodgson, regarding the telegram which appeared in the *Madras Times* headed 'Labour Contracts for Planters.'

20/U. W. Circular from the Secretary, U. P. A. S. I., forwarding copy of Section 19 of the Fugitive Offenders' Act, 1881, (44 & 45 Vic. c. 69) which is referred to in the Government of India's Resolution anent the report of the S. of I. Enquiry Committee.

21/U. W. Circular from the Secretary, U. P. A. S. I., forwarding copy of a letter from the Hon'ble Mr. H. P. Hodgson. Although it refers particularly to a letter from the Central Travancore Planters' Association, it contains matter of general interest.

3/G. A communication from Government to the S. P. A. regarding the new Ghaut-Road.

19/P. Acknowledging receipt of this office letter of complaint against the Police and informing that it will receive due attention.

3/F. Replying to this office letter regarding prevention of coffee thefts, etc.

24/D. Letter from Mrs. Dickins, wishing to become a member of the S. P. A.

The following papers were laid on the table:—

19/P. Letter from the President, Taluk Board, informing that the balance under Taluk Board. Rs.435 has been taken up for Plague purposes, and so cannot be used for repairing the Chembanath Road.

Proceedings of the Central Travancore Planters' Association held at Penshurst Bungalow on Saturday, 21st January 1899.

Proceedings of the Wynaad Planters' Association held at Meppadi, 8th February 1899.

Commercial Circulars No. I of 1899, Ruby (2 copies).

Planting Opinion, 4 copies, dated February 4th, 11th, 18th & 25th.

(Signed) C. G. LECHLER,
Chairman.
(„) R. GOMPERTZ,
Honorary Secretary.

WYNAAD.

Proceedings of a General Meeting held at Meppadi, on 1st March 1899.—PRESENT: Mr. J. W. Hockin (*Chairman*), Messrs. C. E. Abbott, B. M. Behr, L. H. F. Day, A. C. Glenie, Dr. M. Hayes, R. Lamb, C. C. Lance, C. A. Mackenzie, D. Mackenzie, W. MacKinlay, J. R. Malcolm, B. Malcolm, J. S. Malcolm, J. S. Nicols, H. S. Powell, G. Romilly, S. Robinson, A. Trollope, R. K. Walker, A. West, H. Waddington, H. B. Winterbotham, W. G. Wright and E. deFonblanque, (*Honorary Secretary.*)

Proceedings of last Meeting.—The Proceedings of the last Meeting were taken as read.

Election of new members.—The following new members were elected:—

Dr. M. Hayes, proposed by Mr. C. E. Abbott.
Seconded by Mr. G. Romilly.
Mr. C. C. Lance, proposed by Mr. E. deFonblanque.
Seconded by Mr. J. S. Nicols.

Amendment of Rules.—Proposed by Mr. G. Romilly,
Seconded by Mr. R. K. Walker,
That any Resolution that has been passed at a General Meeting of which fourteen (14) days' notice has been given to members shall be considered final, and no further discussion allowed on the subject for six (6) months from the date of meeting. *Carried.*

Coffee Robbery Reward Fund.—A list was circulated for contributions to reward the Police for the excellent manner in which they had prevented the theft of Coffee during the crop season and Rs.120 was collected in the room.

The Secretary was authorized to pay the Police the sum of Rs.150.

Roads.—Read letter from the Collector of Malabar to the Secretary to Government, on the subject of Government funds towards the upkeep of the Calicut-Choladi and Chundale-Sultan's Battery Roads.

Resolved that the Chairman and Secretary be asked to address Government on the subject, through the Collector of Malabar.

U. P. A. S. I.—It was resolved that it was unnecessary to alter the date of the financial year to that of the U. P. A. S. I.

Pudu Padi Post Office.—The Secretary was requested to write to the Postmaster General, asking for a reply to his letter of 22nd December 1898.

Plague.—The Secretary was requested to write to the Collector of Malabar on the subject of interference by Police officials as regards outgoing coolies.

Mr. Romilly stated that his Cherumah coolies had asked for cheques payable at Calicut rather than take cash, as they had been blackmailed on the road.

Mr. D. Mackenzie and Mr. Day made somewhat similar statements.

Papers on the Table.

Papers referring to Plague rules.
Do. Labour Ordinance.
Shevaroy Planters' Association, 5th February 1899.

A vote of thanks to the Chair closed the Proceedings.

E. DEFONBLANQUE,
Honorary Secretary.

KANAN DEVAN.

Minutes of Quarterly General Meeting held at Manale, on 16th February 1899. PRESENT: Messrs. H. E. Tollemache, T. W. Schmid, A. J. Fox, A. W. John, R. Hedges, A. Cameron, J. A. Hunter, C. Burn Murdoch, Nicol Thomson; J. S. Sealy (*Honorary Member*), Baron von Rosenberg (*Chairman*), H. M. Knight (by proxy, Baron von Rosenberg.)

Notice calling meeting taken as read.

Read and confirmed minutes of last meeting.

Mr. A. H. Sharp's retirement.—Proposed by Baron von Rosenberg, "that this Association expresses its regret at the resignation of Mr. A. H. Sharp, its Honorary Secretary for nearly 10 years, on his leaving the district. That it records its grateful appreciation of his unvarying and successful services to the Association—that it resolves to commemorate this appreciation by presenting him with a Silver Punch Bowl, to bear the following inscription—"Presented by the members of the K. D. P. A., to A. H. Sharp, Esq., Honorary Secretary of the K. D. P. A. during nearly 10 years, February 18th, 1899." Seconded by Mr. T. W. Schmid and carried by acclamation.

Chairman.—Proposed by Mr. Thomson that the question of a Chairman *vice* Baron von Rosenberg be held over till next meeting in May. Seconded by Mr. R. Hedges and *carried.*

Honorary Secretary.—Mr. C. Burn Murdoch was elected Honorary Secretary *pro tem.* till May, and accepted conditional to the Association clerk, who knows the work, being allowed him. Proposed by Mr. Hunter, that should it not be possible to arrange for the clerk to do Company's work as well as the Association work, the Association will pay his entire salary for the three months. Seconded by Mr. Cameron and *carried.*

K. D. P. A. Agencies.—Proposed by Mr. S. A. Hunter, that from 1st April 1899, the services of the K. D. P. A. Agents at Ammayanaikanur and Boday be dispensed with by the Association. It is suggested that from 1st April Agents shall be arranged for separately by the K. D. H. Produce Company and by individual planters, but, if possible, that the same Agent at Ammayanaikanur should be retained by all parties, and that their accounts be sent in separately. Seconded by Mr. R. Hedges and *carried.*

Proposed by Mr. J. A. Hunter, that this meeting do confirm the action of the President in paying the Association Rs.1,000 on behalf of the outside members for the land and buildings belonging to the K. D. P. A. at Boday, and that steps be taken to put the purchasers in possession. Seconded by Mr. Nicol Thomson and *carried.*

Proposed by Mr. R. Hedges, that an entry in the account of Rs.500 advance to cart contractor by Messrs. Finlay, Muir & Co., be eliminated therefrom. Seconded by Mr. T. W. Schmid and *carried.*

Surplus Funds.—Proposed by Baron von Rosenberg, that as the Association accounts show a considerable surplus, and passing members having reported that the sum of Rs.700 voted will be quite insufficient for repairing the Boday Mettoo ghaut, a further sum of Rs.1,000 be voted for this purpose. Seconded by Mr. J. A. Hunter and *carried.*

Proposed by Baron von Rosenberg, that any further surplus funds, after the Mettoo Ghaut Road has been put in order, be expended in taking over the three Tanalam houses between Boday and Devikulam at half cost price. Seconded by Mr. J. A. Hunter and *carried.*

Labour Act.—Proposed by Baron von Rosenberg, that the Association supports Mr. Romilly's letter and the points called attention to therein—extradition into Native States is of the first importance to us, it should be made as direct and simple as possible, and the cumbrous roundabout procedure in force in criminal cases avoided—a Labour Act would be of little or no use to us unless extradition is also given. Seconded by Mr. J. A. Hunter and *carried.*

Medical Grant.—Read correspondence with Honorary Secretary *re* medical grant. Proposed by Mr. R. Hedges, that copies of the correspondence be sent to the British Resident. Seconded by Mr. T. W. Schmid and *carried.*

Plague Measures.—Proposed by Mr. Nicol Thomson, that this Association views with alarm and regret the decision of the Travancore Government in refusing to take steps to medically examine immigrants from plague-stricken districts of British India, and takes this opportunity to offer its warmest thanks to Messrs. Finlay, Muir and Co. for undertaking this duty, which ought to devolve on Government. That a copy of this resolution be sent to the British Resident. Seconded by Mr. T. W. Schmid and *carried.*

Proceedings closed with a vote of thanks to the Chair.

C. BURN MURDOCH,
Honorary Secretary.

MARKET REPORT.

By Mail advices of 17th February 1899.

COFFEE.

The *London Commercial Record* says:—The limited supply of really fine qualities continues in good demand at very full prices, but the bulk of the auctions has consisted of more or less undesirable descriptions, and the general tone of the market is dull. Ceylon sold with good competition at fully late rates. There has been a larger supply of new crop East India, of which a considerable proportion, considering the time of year, failed to find purchases; as a general rule the quality has been extremely disappointing, and the only description which has met with a good general demand has been Coorg, which, being much more attractive than any other growth, was nearly all sold at steady prices; with few exceptions, the Mysore has been much below the standard of previous years, both in color and quality, and an unusually large proportion had to be withdrawn from the auctions, and where sales were made there was a further decline in value of 2s to 4s per cwt.; Wynaad was rather easier, and Nelliampathy was fairly steady. Colory Costa Rica brought extreme prices, but other descriptions of Central American were generally slow of sale, and good ordinary sorts declined in value. A quiet tone has prevailed in futures and prices are rather easier, closing as under:—

London ...	Santos.....	March delivery	...	30s. 6d
New York.....	No. 7 Rio.....	„	„	... 550 cents.
Hamburg	Santos.....	„	„	... 30¾ pf.
Havre	Santos...	„	„	... 37¼ francs.
Holland.....	Good ordinary Java		...	... 31 cents.

Imports, Deliveries and Stock of Coffee in London are as follows:—

The preceding figures exhibit—

In the Imports a decrease this year of	1,858	tons.
Home Consumption an increase of	98	„
Export an increase of	320	„
Stock an increase of	2,551	„

Auctions this week have passed off as follows:—

Ceylon.—62 casks and tierces 14 barrels sold, low grown small 35s, medium 61s, bold 79s, peaberry 50s; *Plantation*, smalls 64s to 77s, low middling to middling 99s to 107s 6d, bold 108s 6d to 115s, peaberry 95s to 109s.

East India.—2,171 bags partly sold as follows:—*Coorg*, smalls 47s to 51s, middling colory 68s 6d to 72s, good middling 74s 6d, bold 91s to 98s 6d, peaberry 103s to 115s; *Mysore*, smalls 45s to 47s 6d, low middling 60s 6d to 69s 6d, common bold dull green 80 to 88s 6d, peaberry 95s 103s; *Neilgherry*, smalls 45s 6d to 52s 6d, fine bold 102s, peaberry 80s.

Nyasaland —13 bags withdrawn.

Johore.—*Liberian.*—27 bags dull bold yellow realised 31s 6d.

Jamaica.—Of 256 barrels 238 bags offered 210 barrels and bags sold, smalls 31s to 33s 6d, good small colory 42s, good ordinary greenish 33s 6d to 35s 6d, fine ordinary 39s 6d to 45s 6d, low middling brownish colory 49s to 52s 6d, bold 63s 6d, peaberry 38s to 41s.

Costa Rica.—2,154 bags nearly all sold, smalls 31s to 51s 6d, good to fine ordinary green 43s 6d to 45s, low middling to middling 55s 6d to 66s, good to fine middling 68s 6d to 89s, good to fine bold blue 95s 6d to 102s 6d, very fine hard blue 106s, peaberry 40 to 100s.

Guatemala.—Of 191 bags offered 80 bags sold, ordinary foxy greenish 36s 6d, good to fine ordinary bold brownish 39s to 45s, peaberry 41s 6d.

Vera Paz.—35 bags sold, fine ordinary brownish 41s 6d to 42s, peaberry 40s.

Peruvian.—38 bags sold, good ordinary foxy greenish 36s.

Colombian.—488 bags mostly sold, smalls 27s 6d to 31s, fine fine ordinary 47s, low middling 52s to 52s 6d, middling dull green 57s 6d to 59s, bold dull green mixed pale 60s to 71s 6d, good bold bright greenish colory 83s 6d to 88s, peaberry 56s to 59s.

Venezuelan.—Of 443 bags offered 60 bags sold, fair small green mixed 33s 6d, low middling dull green 48s.

Bolivian.—84 bags sold, good ordinary bold yellowish 40s 6d to 41s

Salvador.—50 bags bought in.

Porto Rico.—361 bags withdrawn.

To-day's auction supplies consisted of 118 barrels, 264 bags Jamaica, 33 bags Nyasaland, 5 bags Peruvian, 288 bags Vera Paz, 630 bags Columbian, 272 bags Costa Rica, 360 bags Ecuador, and 50 bags Guatemala. The sales went off quietly without alteration in prices.

Prices realized at auctions for the principal marks of East India:—

TEA.

Indian.—There was about the same quantity brought to the hammer, the total being 42,100 packages *versus* 41,100 packages in the previous weed, and 30,700 packages for this period of the preceding year. Competition was brisk for nearly all descriptions, particularly common to fair Pekoes and Pekoe Souchongs, which were in many cases ¼d to ½d per lb. dearer, while good medium to fine Pekoes and Orange Pekoes often showed a decided advance when quality was desirable. Ordinary to finest broken kinds, though not taken up so freely as the before-mentioned, also participated somewhat in the improvement.

For 34,200 packages on Garden Account, 9¼d per lb. was realised, against 8½d per lb. for 24,500 packages, and 9½d per lb. for 24,700 packages in the two foregoing seasons.

Ceylon.—There was a marked diminution in the amount catalogued, it being only 14,600 packages, compared with 24,200 packages on the 7th inst., and 22,400 packages for the same time in 1898.

Medium to fine broken Pekoes met an irregular demand and in the majority of cases where fulness in cup was lacking, former rates were barely maintained, though prices were steady for those with attractive liquor. Leafy sorts under 8d per lb. were in special request, and quotations for these were ¼d and often ½d per lb. over those of last week. The better grades of Pekoes and Orange Pekoes were also well supported, and Continental orders were more plentiful for suitable parcels. Finest and choice lines were sparsely represented in the sales, but the few available retained their value.

The average has risen to 8½d per lb. On the 9th inst. it stood at 8⅛d per lb., and 7⅞d per lb. in 1898.

Java.—Rather over 700 packages of direct import were submitted to the trade, and in sympathy with other growths fine teas ruled firm, while inferior were dearer.

For next week, 1,600 packages are declared.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns were:—

From 1st to 14th Feb., 1899 ... ... 8,244,516 lbs.
" " 1898 ... ... 8,279,439 "

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated February 17th, 1899, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON,
From 1st June to Date.

	Indian.	Ceylon.	Java.
1898-1899.	1,246,411 pkgs.	812,291 pkgs.	32,630 packages.
1897-1898.	1,227,173 "	859,323 "	30,489 "

42,833 pkgs. Indian
14,927 " Ceylon
756 " Java
} Total 58,516 packages were offered in public auction this week.

The United States and Canada took the following quantities of British Grown Tea during each of the last seven years:—

1898.	1897.	1896.	1895.
lbs. 13,608,696	11,361,840	9,623,283	7,816,467

1894.	1893.	1892.
lbs. 4,723,370	3,981,837	3,075,900

It is satisfactory that an increase should have been shown last year, when the unsettled political conditions are remembered to-

gether with the imposition of a heavy duty upon Tea, imposed as a temporary war tax. The most interesting feature has been the transit of Tea from Calcutta and Colombo in vessels sailing under the American flag and going direct to New York.

Indian.—The market has further advanced for all descriptions Teas under 6½d. to the extent of ¼d. to ½d., better descriptions, with good liquor, from ½d. to 1d. per lb. The comparative costs given in the table below illustrate the moderate range of prices ruling in spite of the late advance. Exports to U. K. from 1st April to middle of month, lbs. 133,937,000, against lbs. 132,420,000; shipments first half of month lbs. 2,210,000, against lbs. 1,970,000 last year.

Ceylon.—All Teas up to 8d. per lb. were dearer, Teas for price being ¼d. to ½d. up. Exports to U. K. first half of month lbs. 4,500,000 against lbs. 4,500,000 last year. Av. for wk, 8·55d., against 7·39d. same wk. 1898.

Java.—The small sale passed with good spirit at rather dearer prices.

IN AMERICA.

The *American Grocer* of 1st ultimo reports:—Market very firm for low priced tea, with better demand. The character of the market will be shown at the public sale to-day.

To-day at noon the Montgomery Auction and Commission Company hold a monthly auction sale of teas, comprising 3,546 packages, as follows: 285 half- chests Moyune, including fancy extras; 50 half-chests Japan, basket-fired; 147 half-chests Congou; 329 packages India, Java, and Ceylon Pekoe—an attractive assortment; 1,436 half-chests and boxes Amoy—fancy, crop 1897-98; 58 half-chests Foochow; 1,241 half-chests and boxes Formosa, including an invoice of "Golden Key."

Thomas Martindale, of Philadelphia, under date of January 28, says: "The week now closing has been a wonderful week among those lucky men who hold fairly large stocks of teas, and the lines that have changed hands and the consequent appreciation in their values have somewhat dazed the rank and file of the grocery trade, and they rub their eyes and wonder what it all means. To-day inquiries came from New York asking for spot Congous, either old or new, at prices that last week would have appeared high; but now they are not high enough to induce the owners (what few there are) to part with their holdings. We are all deluged with request from all corners of this broad land for samples of teas, it matters not what kind,' any old thing' will do, provided it is ' under a quarter.' From the paucity of stocks held here and in other large cities it would seem that teas will continue to advance in price for some time yet; at any rate, until the regular jobbing trade is fairly well supplied."

IN CANADA.

The *Canadian Grocer* of 3rd ultimo says:—Teas, generally, are developing a stronger tone. Spot teas of Indian and Ceylon growth on the Canadian market are practically exhausted, and brokers are, in some instances, asking a cent per pound more than they were a week ago.

The exhaustion of the stocks of these teas is alone sufficient to give the local market a firmer tone, as prices here have, for some time, ruled much lower than in London, Eng. But the tendency of the outside markets is still upward.

China green teas, which have been firm for some time, are also dearer, holders refusing to accept less than an advance of one cent per pound, over the figures at which they were sellers a fortnight ago.

Local jobbers are also firmer in regard to Japan teas, and an advance of ½c. per pound is demanded in some instances.

CINCHONA.

Good thin Java quill, partly mossy, sold at 5*d.* per lb.; fair flat. bold Cartagena at 4½*d.*; good flat yellow Bolivian cultivated Calisaya at 10½*d.*; and fine large bold East Indian quill "Cascade's" at 5*d.* per lb.

Amsterdam bark market.—Cinchona bark advanced 42 per cent. in price in the Amsterdam auctions. The tone of the market was animated and nearly the whole of the offerings sold, no less than 18,564 kilos, or 40,600 lbs., of quinine in bark form being sold out of 21,778 kilos, or 47,640 lbs. The unit came out at 6·7 cents per half-kilo (between 1⅛d. to 1¼d. per lb.), against 4·7 cents at the last auctions. Altogether 4,310 packages were sold out of 4,777 offered. *Manufacturers'* bark ranged from 9½ to 69¼ cents, and *Druggist's* bark from 14 to 50 cents. Below we give the amounts purchased by the various buyers, stated in kilos. of quinine sulphate equivalent:—

English and American Quinine factories (principally).	Brunswick factory.	Mannheim and Amsterdam factories.	Frankfort and Stuttgart factories.	Miscellaneous buyers.	Total sold.	Bought in or withdrawn.	Total offered.
4,662 kilos.	3,761 kilos.	3,460 kilos.	3,203 kilos.	3,478 kilos.	18,564 kilos.	3,214 kilos.	21,778 kilos.

QUININE.

The speculative movement of the past fortnight continued until Tuesday, when matters quieted down a little. On Friday and Saturday some 170,000 oz. of German changed hands at 1*s.* 0½*d.* to 1*s* 1*d.*; April delivery, 1*s.* 1¼*d.* to 1*s.* 0⅞*d.*; May, 1*s.* 1⅝*d.* to 1*s.* 1½*d.*; and June, 1*s.* 1½d. On Monday the market again opened strong with an active demand, and it was estimated that some 120.000 oz. (including sales and resales) found buyers at 1*s.* to 1*s.* 1¼*d.* for spot, and March, April, and May delivery at 1*s.* 1½*d.*, although for forward delivery there were few sellers On Tuesday the market advanced to 1*s.* 1¾*d.*, the business done (50,000 oz.) being mostly at 1*s.* 1½*d.* to 1*s.* 1¾*d.*, with small lots of B & S. brand at 1*s.* 2*d.* per oz., the market closing with sellers at that figure. The makers decline to do business at any price at present, but it is stated that they will advance their quotations 2*d.* per oz. after the bark-sales. It is notable that outside brands are not looked at, showing that the demand is purely speculative.

Later.—Since the foregoing was set up the result of the Amsterdam cinchona-sales has been received, and owing to the 44-per cent. advance in the unit, buying has been vigorously resumed in Mincing Lane at 1*s.* 2*d.* for spot, and 1*s.* 2¼*d.* May. B. & S. and Brunswick brands have advanced their prices by 2*d.* per oz. to 1*s.* 2*d.*; B. & S. not being willing sellers. Other makers are expected to follow at the rate of 2*d.* per oz. all round. In auction Amsterdam and Taillandier's brands were held for 1*s.* 1*d.* per oz., and the agent of the former now wants 1*s.* 1½*d.*

CARDAMOMS.

Offered, 269 packages. Sold, 91. A feature of the offerings was again the large proportion of *Ceylon Malabar* kind put up. Very little of them sold, however As regards *Ceylon Mysore*, the following prices were obtained: Fine bold to extra bold, 4s. 4d.; good ditto, 3s. 8d. to 3s. 11d; fine bold, 3s. 11d.; good bold, 3s. 6d.; ditto brownish, 3s. 4d.; good medium, part lean, 2s. 10d.; good very small, 2s 7d.; fair dull, long brownish, 2s. 4d.; seeds, 2s. 6d to 2s. 8d. *Malabar* dull lean, 2s. 8d. to 2s. 9d.; brownish or spotted, 1s. 8d. to 2s. 2d.; seeds, 2s. 8d. long wild exceptionally good, 3s. 7d.; fair, 2s. 7d.

COCOA.

A further slight advance was obtained at Tuesday's auctions, when 6,629 bags were offered, of which nearly 4,500 bags sold. Of 1,858 bags Trinidad catalogued, 1,700 bags sold at 1s over valuations—superior red 78s to 80s, good to fine ditto 74s to 76s 6d, ordinary to fair 72s to 73s, and low to common weathered 63s up to 69s. Of 3,591 bags Grenada offered, 2,400 bags were placed at 72s to 73s for fine, 69s 6d to 71s for good, 66s to 69s for common to fair, and 61s for low, showing an appreciation of 1s per cwt. 157 bags Jamaica mostly sold at steady rates—69s to 70s for good fermented and 65s 6d to 66s for common to ordinary. 66 bags Costa Rica brought 69s to 72s. 199 bags African retired unsold. Of 734 bags Ceylon brought forward, 230 bags sold with no material alteration from last week, viz.: good bold and medium red 70s to 74s, medium and small partly grey 67s to 69s black and pickings 58s 6d to 64s per cwt. Private sales include 50 bags Bahia at 71s 6d, 250 bags

fine African at 72s, 600 bags Ceylon, fine bold red 83s, collected 68s to 70s, and 250 bags Guayaquil, Arriba at 78s to 82s and Caraquez at 71s to 72s 6d per cwt., also 500 bags Grenada ex the auctions at 71s 6d to 72s 6d.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

PEPPER.

Black.—A firm market this week, and prices in sellers favor. On the spot about 1,000 bags Singapore have been sold at 5¼d to 5⅜d for fair, and for arrival 200 tons are reported placed, viz., March-May at 5½d to 5⅝d, closing buyers on the return of small shipments for the first half of the month.

At public sale on Wednesday only 30 bags Singapore were catalogued of which 13 bags damages sold at 5⅛d per lb.

The shipments of Black Pepper for the first half of February compare as follows:—

	1899		1898.	
U.K.—Singapore... 50	75		230	230
,, Penang ... 25			*nil*	
Continent...	30			40
U.S.	150			*nil*
Total tons ...	255			270

To-day 60 tons Singapore sold: spot at 5¼d, February-April and March-May shipment at 5 1/32d. *White* is quiet and easier. On the spot 400 to 500 bags have been sold, viz., fair Singapore at 8⅛d down to 8 1/16d, and fair Penang at 7⅞d to 7 15/16d. For arrival the only sales reported is a lot of 10 tons Singapore March-May shipment at 9d per lb.

At auction on the 15th inst. 228 bags Singapore passed the hammer unsold at 9d to 10d per lb.

The shipments of White Pepper for the first half of February compare as follows:—

	1899		1898.	
U.K.—Singapore... 20	20		230	230
,, Penang *nil*			*nil*	
Continent	20			*nil*
Total tons ...	40			230

GINGER.

Cochin.—For new crop cut there was good competition, but other kinds were very slow of sale, and very wormy small cut sold at lower rates. 178 cases 182 bags catalogued and 170 cases 20 bags sold—*new crop*, good bold some medium cut and scraped 85s medium with a little bold ditto 70s 6d, medium and small ditto 50s, small 38s, small, washed brown rough 25s, cuttings 18s 6d; *old crop* small, roughly cut and scraped very wormy 25s 6d to 27s per cwt.

Japan.—44 bags partly sold at 18s per cwt. for sea-damaged limed.

Jamaica.—315 barrels met a good demand and 250 barrels sold at some advance, small brown 67s, low to common dark Rhatoon 55s to 63s per cwt.

China Galls slow of sale at 52s 6d c.i.f. On the spot no sales reported.

Siam Sticklac is quiet and sales unimportant.

Indian and Ceylon Tea taken by the United States and Canada during each of the last seven years.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 24th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Please note the change of address.

MR. CAMERON ON LEAF-DISEASE IN COFFEE.

We have thought it well to place before our readers in complete form Mr. J. Cameron's report on his recent visit to Coorg for the purpose of conducting certain experiments and making investigations with a view to the improvement of coffee cultivation and the prevention of leaf-disease. The report includes a reprint of an article that Mr. Cameron contributed to this paper some time ago. This also we give to-day, notwithstanding that it has appeared in our columns before. Our desire is that the present issue should put before the reader the whole of Mr Cameron's report, with the sole exception of the botanical list that has not yet been submitted. This will follow.

It is unnecessary to introduce Mr. Cameron to our readers or to dwell upon his capabilities as an expert in plant-cultivation. He is well known in Southern India, and his report speaks for itself. Briefly, he advocates what every experienced coffee-planter now recognizes to be the chief preventive of leaf-disease and its best cure—*viz.*,

good cultivation. From beginning to end the report harps upon harmonious strings: select seed carefully, plant carefully, prune carefully, shade judiciously, manure prudently, study the requirements of the plant, and meet them as far as may be. Thus you will have a hardy, disease-resisting plant, and will be able to correct some of the errors of the past. These errors are very forcibly referred to in the "summary" given by Mr. Cameron at the close of his remarks. He there states that the coffee industry in Coorg has entered the forcing stage. The soil has been unfairly exhausted, too much has been claimed from it, and, as the above authority says:—"What was wasted and taken from nature as a free gift, has now to be returned with more than compound interest, and it will take a long time, if ever accomplished, to readjust the debt." He adds that the planter who can return to the land a liberal percentage of his profits, will sustain the forcing system for many years to come, even if no other factor arises to infuse new life into the industry. But he considers that not only cultivation, in all its details, must have very careful attention, but that hybridisation will be found to be a very important matter, and "that the renovation of coffee is not wholly a matter of soil enrichment." No doubt he is right. Yet, reviewing his remarks from the practical planter's point of view, we would specially direct our readers' attention to what is said about *cultivation*. Hybridisation is certainly not a 'fad,' it deserves the planter's earnest consideration, and we trust that a goodly number will take it in hand, and experiment patiently and wisely. To the majority, however, the protection of their own particular interests must be the first care, and we cannot expect that the work of hybridisation will occupy the attention of more than a few. Nor can we even desire otherwise, for it is a work that must be carried on with the utmost care Neglected, when once begun, or carried on without due discrimination between what is good and what bad, it might do harm where good was intended. It is better, therefore, that the few should give special attention to the fascinating mysteries of cross-fertilisation, &c., and the many attend diligently to the practical needs of the plants on their estates, with a view to the curing of disease where it has broken out, and the prevention of it in other cases. Mr. Cameron points the way He wisely states that a table showing quantities of different manures to be applied per acre for different crops is not of the slightest use to the planter, who possesses but one product on many different kinds of soil. His report also hints that no fixed rule for the manuring of coffee-lands in general can be laid down. "The application of proper manure in correct quantity and at the most serviceable time, are things which should be assiduously learned from practical experience." Experiment and experience should go hand in hand, and Mr. Cameron's report should be read not as intended to tell the individual planter exactly what he should do, but to give him the general lines he should try to follow, varying the details according to the circumstances, the conditions, the necessities, of his own particular estate.

With reference to Mr Cameron's remarks on the employment of seeds from different districts and countries, and the study of the coffee fields of the whole planet, we have a word to say. Mr. Cameron makes kindly allusion to our own attempts in this direction. Now, while various planters have manifested an interest in our papers on "Coffee in Distant Lands," not one has yet taken notice—so far as we can judge—of our suggestion concerning the importation of foreign seed and the exchange of seeds generally. It may be that many planters are already effecting exchanges or importations of the kind suggested; but we have doubts on this point. We go so far as to say that an organised system of 'importation' and exchange is almost a necessity at the present time, and though it is a work that District Planters' Associations might carry out for themselves, or the U. P. A. S. I. for all of them, we are still ready to do all in our power to aid it, whenever a start is made. Coorg coffee-seed has made a name for itself all over the world, and we can easily imagine that Coorg planters may think they have nothing to gain by importing what they are likely to regard as *inferior* sorts It is at least possible, however, that present superiority may vanish if exchange of seed be avoided, and a system of in-breeding persistently resorted to. For the rest, we would invite our readers' special attention to Mr Cameron's remarks on shade and drainage. It will probably be said that there is nothing *new* in the advice he gives. Perhaps this is the case. Nevertheless his advice is good, for it lays stress on several very important matters, it puts them clearly before the planter, and if he is wise enough to act upon it, he will eventually be a gainer, no doubt. The report before us is the outcome of Mr. Cameron's own experiments in Bangalore as well as of his brief tour in Coorg, but it must only be regarded as a more or less general statement of what is desirable for the production of strong and healthy coffee plants. Considering how short a time Mr. Cameron was in Coorg, his report is specially deserving of praise, and the planting community owe him a debt of gratitude for studying matters so closely and carefully as he has done. They are indebted also to the Mysore Government for the loan of his services, and to the British Resident for the kind assistance he rendered when the idea of a special visit to Coorg was first mooted. There is but one practical way of demonstrating gratitude for the services rendered by Resident, Government and Specialist. This is, to make good use of the advice given. If planters in Coorg and Mysore and on the Nilgiris and elsewhere profit by what Mr. Cameron has done in their behalf. they will give the best possible proof of their appreciation of what has been done for them.

TEA IN ASSAM, 1897-98.

An Official Administration Reports often contains very useful information, but there is generally a strong flavour of "ancient history" about it, owing to the delays that occur before such reports are placed before the public. Thus, the Report on the Administration of the Province of Assam for the year 1897-98 appears almost a year later than the last date to which it has reference. Still, though much of its interest is lost in consequence of this, much still remains, and the statistical portion that refers to tea manufacture will be of interest, even now, to many of our readers. It is curious, by the way, that tea is classified entirely under the head of "Manufactures" in this report; no mention of tea cultivation is made, under the head either of crops or "agriculture." However, the fact that the tea plant is *grown* in Assam is not entirely overlooked

in the report under notice, which states that the year 1897-98 was an unfavorable one for tea, the prolonged drought from October 1896 to March 1897 having checked the growth of the leaf, so that plucking operations were delayed. The total area under mature plants at the end of the year was 263,213 acres, which shows an increase of 15,558 acres over the figures of the preceding year; while the area under immature plants had decreased from 49,259 acres to 47,337 acres. The total acreage under tea was thus 310,540 in 1897-98, against 296,914 in 1896-97—an increase of 13,626 acres, or between 4½ and 5 per cent. The total outturn of the province was 107,266,332 lbs., or 2,461,027 lbs. less than in 1896, the average yield per acre being 408 lbs., as compared with 437 lbs. on the previous year. Thus an extension of acreage of nearly 5 per cent. was accompanied by a reduction of rather over 2 per cent. in the outturn. Unfortunately, there was also a falling off in the average price realised, which was returned as 5 as. 11 p. per lb. for Surma Valley teas and 7 as. 8 p. for Brahmaputra Valley teas, as compared with 6 as. 10 p. and 8 as. 3 p, respectively, in 1896. The total area of tea garden grants increased from 968,895 to 1,014,017 acres.

Allowance must always be made for inaccuracies, as planters are not usually willing to furnish very accurate returns regarding their estates. The Assam tea industry is so extensive, however, and tea stands so entirely by itself there as the only manufacture of importance, that the figures before us may be taken as sufficiently near accuracy for all practical purposes. What we notice specially is that extensions continue Low prices have not stopped them. Drought and depression may check but they do not entirely stop the taking up of new lands, the further planting out of gardens previously partially opened. At the the end of 1897 there were 822 tea gardens in Assam, at the end of 1896 only 800. In the interval two had been closed, two amalgamated with others and abandoned, but 27 gardens had been newly opened. In 1896 the number newly opened was only 20, but in that year the work of amalgamation was proceeded with much more actively, 31 gardens being thus merged in others. In Cachar no new garden was opened in the year under review, in Sylhet only 3; the chief changes were in Kamrup (6 new gardens) Sibsagar (5) and Lakhimpur (7); but the *area* increased chiefly in Sylhet, where 31,223 acres were added to the area under tea in the preceding year. The following figures show the total area of all lands held by tea planters in 1897—presumably *at the close* of that year—the areas under tea cultivation and the yield:—

	Total acres.	Under cultivation.	Yield lbs.
Cachar	282,583	61,190	22,031,593
Sylhet	212,626	70,200	26,153,168
Khasi and Jaintia Hills ...	100	30	4,000
Goalpara	852	410	140,798
Kamrup ...	20,283	5,873	753,228
Darrang	122,050	33,984	11,154,360
Nowgong	53,160	12,659	4,019,795
Sibsagar	246,907	70,644	24,021,294
Lakhimpur	197,700	55,560	18,988,096
Total ...	1,136,261	310,550	107,266,332

The official report warns us that the area figures shown against Sylhet in the table from which the above figures are extracted, are of doubtful accuracy. The rate of outturn varied from 132 lbs. per acre in Kamrup to 474 in Sylhet. The yield per acre for the Surma Valley, the Brahmaputra Valley, and the whole province was, according to district returns:

	1896. lbs.	1897. lbs.
Surma Valley	460	440
Brahmaputra Valley	431	384
For the whole province	443	408

More interesting still, in many ways, are the following figures, which give the area under mature and immature plants and the total area of tea gardens in Assam during the last fifteen years:—

	Under mature plants. acres.	Under immature plants. acres.	Total area of tea gardens. acres.
1883	161,707	27,746	923,664
1884	158,158	31,694	913,476
1885	159,876	37,634	921,891
1886	170,138	33,855	934,134
1887	177,900	33,179	950,171
1888	188,329	28,347	955,499
1889	196,689	30,560	990,665
1890	200,658	30,380	994,497
1891	208,407	33,416	996,746
1892	213,525	33,667	1,044,984
1893	221,368	35,257	1,042,277
1894	229,316	39,480	1,054,992
1895	234,909	41,105	995,787
1896	247,655	44,254	968,895
1897	263,213	47,337	1,014,017

These statistics are a record alike of steady progress and of the enormous magnitude that the tea industry has now attained in the province of Assam.

RUBBER IN PERAK.

Mr. L. Wray, Curator and State Geologist, Perak, has published a very interesting memorandum on Rubber growing in Perak. He states that the first seed of the Pará rubber was introduced into Perak in the year 1882, but did not germinate. A second lot, received a little later, was planted at Kuala Kangsar; so that the larger trees there are now about 14 years old. Some seed from these was planted in the Museum grounds at Tarping in 1887. The soil is very bad, the land having all been mined over, yet the trees have grown well and have attained a considerable size. So well did they do in fact, that it was decided to plant Pará rubber trees out on waste lands, and a commencement was made in 1891. The trees are doing well. They do well also at Parit Buntar, Siriawan, Tapah, and Batu Gajah, and Mr. Wray considers that they "will thrive in any locality, from the *bakau* swamps to the foot-hills, and on any soil, from rich alluvial to old mine-heaps." He thinks that from 15 to 20 feet apart is the correct spacing. The greatest difficulty in planting *Hevea brasiliensis* is, he says, the very short time that the seed remains good after it falls from the trees. The time that elapses before they are planted should not under any circumstances be longer than a week, and if they can be planted before this so much the better. Sown at once, nearly all germinate; but each day that intervenes increases the number of failures till, at the expiration of ten days or so, none grow. The trees are prolific seed-bearers. Where the land is ready it is an advantage to plant the seed at stake, but where this cannot be

done not much loss would follow planting in nurseries and then transplanting. "The thing to avoid," says Mr. Wray, "is the production of double stems near the ground, caused by the original shoot dying out or being broken off." A little judicious pruning in the first few years is advisable, after that they need very little care. Mr. Wray adds some interesting remarks on tree-tapping, but we need not concern ourselves at present with this branch of the subject.

If planters who have tried *Pará* or *Ceará* or *Castilloa* in Southern India would give us brief notes of the results achieved, they might pave the way for an extension of cultivation. If these trees could be grown in India so as to yield a fair amount of rubber, they should prove a source of considerable profit to planters.

CINCHONA.

Animation characterised the last Bark sales at Amsterdam, and the desire to buy was general. The *Chemist and Druggist* reports that the richest parcel offered was a lot of 14 bales Ledgeriana stem bark in broken quill, produced on the Government estate. It analysed 11·43 per cent. of sulphate of quinine, and sold at from 68¾ c. to 69¼ c. per half-kilo. The quantity of bark bought in at the auctions represented an equivalent of 3,214 kilos. of sulphate of quinine. The following figures show the result of the first two auctions of the years 1899, 1898, 1897, and 1896 :—

—	Packages offered at the two Sales.	Total Weight.	Total Quinine.	Average Quinine Content.	Quinine Sold.
		kilos.	kilos.	per cent.	kilos.
1899 ...	12,867	1,103,249	53,547	5·26 to 5·39	47,682
1898 ...	12,202	1,095,672	56,181	5·14 „ 5·40	28,288
1897 ...	12,481	1,136,086	59,766	5·26 „ 5·75	50,128
1896 ...	14,441	1,320,438	69,037	5·14 „ 5·53	54,534

The units were as follows :—

—	1899.	1898.	1897.	1896.
First sale ...	4·70c.	6·90c.	2·12c.	3c.
Second sale ...	6·70c.	5·50c.	2·90c.	2·82c.

The rise in prices is decidedly encouraging to planters.

By the way, three new kinds of cinchona-bark were brought to the notice of the Zürich Pharmaceutical Association at a recent meeting. Two were from South America and were supposed to be of the old *Calisaya* variety, but only one was of that class the other being the cinchona of Cochamba. The barks were very poor in alkaloids, and neither gave the thalleoquin in reaction, so that they were free from quinine. Although apparently belonging to the yellow barks, they are described as most closely resembling Maracaibo bark. Nothing is said about the third new kind put forward beyond the mere fact that it was placed before the meeting.

U. P. A. S. I. SECTION.

[*Under the control of the Secretary, U. P. A. S. I.*]

Mr. E. E. Green, the Government Entomologist, Ceylon, has sent the following interesting letter, dated 11th inst. :—

As bearing on the question of the importation of Lady-bird beetles from Australia, it may interest you to learn that on examining some specimens of 'Mealy-bug' (*Dactylopius* sp.), sent from N. S. Wales—for identification, I found a live Larva of some lady-bird beetle that had been accidentally included in the small package and had subsisted during the voyage on the coccids sent me for examination. The specimens arrived in a small box—about 2 inches in diameter—and came by the ordinary post, without any special care in packing.

This accidental introduction promises well for the successful importation of regular consignments of beneficial insects by post.

I am leaving for England on the 8th April—on short furlough—I return to Ceylon in September—to take up my new appointment as Economic Entomologist to the Ceylon Government, with residence at the Royal Botanic Gardens, Peradeniya.

* * * * *

Mr. John Cameron's report on his visit to Coorg, of which a copy is given elsewhere in this issue, has been published also in pamphlet form, and copies have been despatched to the various District Planting Associations, and newspapers, &c. Planters requiring copies can obtain them, at 8 annas per copy, from Messrs. Higginbotham & Co., Madras, or Messrs. E. C. Duff & Co., (the proprietors of "Planting Opinion") Madras, or the Secretary to the U. P. A. S. I.

* * * * *

In regard to the Labour question, the Madras Government has been requested to give full consideration to the views expressed by the U. P. A. S. I. in August 1897 and, before adopting any such Bill as has been proposed, to take the sense of the planting community in respect to it, through the medium of the Planting Member of Council. Steps have been taken to ascertain the opinions of members of the various District Planting Associations interested, and these will be duly put forward for consideration.

* * * * *

Reference was made in the Government of India's resolution on this subject to "section 19 of the English statute at present applicable to cases in which extradition from India is sought by courts in Ceylon." Our readers will, therefore, probably be interested in the following extract from the Act referred to, the Fugitive Offenders Act, 1891 :—

Where the return of a prisoner is sought or ordered under this part of this Act and it is made to appear to a Magistrate or to a superior Court that by reason of the trivial nature of the case, or by reason of the application for the return of such prisoner not being made in good faith in the interests of justice or otherwise, it would, having regard to the distance, to the facilities of communication, and to all the circumstances of the case, be unjust or oppressive, or too severe a punishment, to return the prisoner either at all or until the expiration of a certain period, the Court or Magistrate may discharge the prisoner either absolutely or on bail, or order that he shall not be returned until after the expiration of the period named in the order, or may make such other order in the premises as to the Magistrate or Court seems just.

Any order or refusal to make an order of discharge by a Magistrate under this section shall be subject to an appeal to a superior Court.

MECHANICAL TEA-BULKING.

Mr. J. H. Apjohn, Chief Engineer to the Port Commissioners, Calcutta, lately gave a demonstration on the working of his invention for the mechanical bulking of tea, and re-packing. The chief objection to any such process is that factory-bulking must always have the preference. The following remarks in a review of the Tea Trade by Messrs. Barnes & Co., Calcutta, are distinctly *apropos* :—

"At a time when every saving in expenses is of vital importance to growers, the necessity of most careful bulking cannot be too fully impressed upon them, and it stands to reason that the cheapest and best place for bulking is the factory, because labour is cheaper. facilities are handy for packing tea quickly while it is fresh. Unnecessary delay and exposure are avoided, and a saving of ¼d. per pound in London charges is made. It cannot be denied that many fine parcels of tea lose flavour through lying all day on a warehouse floor, exposed to the air, while the treatment in re-packing leaves much to be desired Again, where teas are sold "to arrive," on forward samples, which is a growing custom in the American trade, it is of the first importance that the whole of the break should be of one dead-level quality, which cannot be obtained without careful bulking in the factory. In Australia and foreign markets, where large warehouses do not exist, and bulking cannot therefore be carried out, the break is represented by two or three chests, from which buyers draw samples, and upon these samples purchase the teas, and owing to unequal quality, frequent allowances and rejections have now to be made, which would otherwise be avoided During the past season a few parcels came before us where the difference in quality in teas, invoiced as one break, was as much as 8d. per pound!!"

There is not the slightest reason to suppose mechanical bulking to be impossible, but it must be adapted to the requirements of single factories. As far as we can ascertain from the remarks of our Calcutta contemporaries Mr. Apjohn has not yet attained this goal. His idea is to bulk the teas in *Calcutta*.

NOTES.

Calcutta Tea Sales. The average price realised at the last sales was 5 as. 1 pie.

Prize Essay. We hope to announce the result of this competition in our next.

Ceylon Tea in Russia. The Thirty Committee has voted a further sum of £500 for advertising and pushing Ceylon tea in Russia.

Fire at Bogawantalawa. A serious fire is reported from Ceylon, the Kotiyagala and Bridwell *Kaddies* at Bogawantalawa having been burnt down on 10th instant, soon after midnight.

Tea in Coorg. The following appears in the Report on the Administration of Coorg for the year 1897-98: "The opening of a tea plantation by a syndicate in the Sampaji Ghat. a district where coffee has completely died out, will, if successful, and it promises well, form the commencement of a fresh era of prosperity in Coorg.

Coffee and Cocoa in Martinique. Both Liberian and the "Mocha" coffee are being cultivated extensively in Martinique, but the product will not be exported for some years to come, when the trees will come into full bearing. Cocoa has already made great progress, but similar remarks apply to it also. A premium is granted to cultivators by the Consul Général.

Coffee in British Africa. *Rhodesia*, in an article on the Cape to Cairo Railway, has the following sentence with reference to the future traffic on the proposed railway :—"India rubber from the west of the trunk line, coffee from Northern Rhodesia—and it may be here remarked that the finest coffee in the world is grown in the Shire (Highlands) not to be beaten in flavour even by Java."

Coorg in 1897-98. In a prefatory note to the Coorg Administration Report, 1897-98, Colonel Donald Robertson, the Chief Commissioner, observes :—"The year was an eventful one in that the coffee crops upon which the prosperity of Coorg mainly depends, was, following the previous year's inferior outturn, a poor one, whilst the money market was remarkably tight; so much so, in fact, that it was difficult to obtain money on any terms."

The London Tea Market. Messrs. Gow, Wilson & Stanton, cabled to Colombo on 9th instant that the London tea market was generally steady, good liquoring sorts easier, and Pekoes for price dearer. The average for the week was 8¾*d*—¼*d* up. Reuter reported "medium rather irregular," and stated that 27,000 packages Ceylon tea had been sold out of 28,000 offered, and 34,000 Indian out of 36,000. The average for Indian was 9¼*d*. an advance of ¼*d*. upon the previous week's rate.

More Statistics. The *St. Louis Globe Democrat* is very near absolute accuracy in its figures on the import of quinine into America. The information is conveyed to the public in the following paragraph :—"Quinophagists."—A new word applied to Americans is "quinophagists," indicating that they consume more quinine than any other people in the world. The total imports exceed 1,500,000,000 grains a year, an average consumption of 20 grains to each inhabitant.

Vanilla in German East Africa. Dr. W. Busse states in a German official publication that the results obtained in the cultivation of Vanilla in German East Africa leave no doubt that the colony is well adapted for it. The experiments made in the Cameron district give equally favorable prospects. East African vanilla holds its own with the best Bourbon kind, and it is believed that the supply from the German protectorate will, at no distant time, cover the German demand.

Java Tea in Holland. The following figures give a comparison between Java Tea in Holland in 1897 and 1898.

	1897. Chests.	1898. Chests.
Imports	67,600	67,900
Home consumption	32,600	36,200
Exports	28,900	34,900

Those for 1898 are the top figures. The exports include: To Germany, about 16,000 chests; to England, about 10,000 chests; to Russia, about 1,800 chests; Persia and the Levant, 5,900 chests.

Ceara Rubber in New Caledonia On return from leave Governor Feillet took with him 10,000 seeds and distributed them through the "Union Agricole" to several of the settlers for trial. The result is stated to have been "marvellously successful." With few exceptions, the seeds sprouted and the trees have withstood a cyclone. In fact, the New Caledonians are convinced that the Ceará Rubber tree "does not require as hot and moist a climate for its development, as is the case with other species of the india rubber tree." We wonder if they will still hold this view when the time comes for *tapping* the trees.

Cocoa in Venezuela. It is reported that Cocoa is scarcely produced at Maracaibo in sufficient quantity for home consumption, that only 19 tons were exported in 1896, and it is added that "prices obtained in the consuming markets do not encourage the growers to pay much attention to the Cocoa plants." Nevertheless exports from other parts of Venezuela are considerable. Thus in 1896:—

	Kilos.	Value.
La Guaira	5,130,000	£307,800
Puerto Cabello	376,444	20,000
Maracaibo	38,704	2,000
Ciudad Boliva	22,983	1,014

Kaiserliche Königliche Ceylon Tea! Some time ago the "Thirty Committee" forwarded to Berlin 5,000 lbs. of Ceylon tea for distribution to the German regiments, as might seem best, and at the same time a special silver mounted chest (made of various Ceylon woods), containing choice Ceylon tea, was despatched for presentation to His Imperial Majesty the German Emperor. The duty of presenting the chest was entrusted to Mr. J. P. Ryan, on behalf of the Committee, in co-operation with the proper authorities. Mr. Ryan has now cabled, "personal audience Emperor Empress to-day. Both cordially thank Ceylon." Therefore the heart of the Ceylon planter is glad, and the local earth rejoices at the k. k smile.

Tea and Coffee. In the course of a comparative statement (in *McClure's*) of the foods used by the principal people Mr. G. R. Waddon states that the consumption of *Tea* is as follows:—(in ounces): United Kingdom, 88; Australia, 88; Canada, 70; United States, 24; Russia, 9, and of *Coffee* (in ounces): Netherlands, 370; Denmark, 247; Belgium, 176; United States, 155; Switzerland, 112; Germany, 78; France, 53; Austria-Hungary, 32; Italy, 17; Great Britain, 11; Spain, 9; Russia, 3. The Netherlands get *good* coffee, the United States *very cheap* coffee; but why Italy, Great Britain, Spain and Russia should compare so badly with Belgium and Switzerland is far from clear. Perhaps a little canvassing is wanted?

The American Tea Duty. The needs of the American Government are such that more, and not less, revenue will be needed. *Apropos* of questions raised as to the probable removal of the duty on tea, Assistant Secretary Howell recently stated:—"It is practically certain that no change can be made until the summer of 1900, even if it is made at the earliest possible moment. Action will not be taken at the present session of Congress, and the next regular session does not begin until December, 1899. A thorough revision of the revenue laws would require many weeks of consideration in committee, and, according to all precedents, would not become law until June or July, 1900. I do not think any changes of the revenue laws will occur at that time, but it is practically certain that none can occur at any earlier date."

Manipur Tea Seed. We learn from the Assam Administration Report, 1897-98, that there was a noticeable decrease in the import of tea-seed from Manipur, partly due to the crop having failed in the Manipur State and partly to the depreciation of the Manipur seed. The report states:—"This seed used to hold a high place, and commanded a ready sale in the market, but last year it proved most unsuccessful, as nearly 90 per cent. of it was bad and would not germinate. The indiscriminate plucking of the seed before it was sufficiently ripe is the cause assigned for this result." Imports in 1895-96 were 877 maunds, in 1896-97 4,351 maunds, in 1897-98 only 645 maunds. In 1895-96 the value was estimated at about Rs.26 per maund, in the subsequent years at Rs.40 per maund.

Java Quinine. During 1898 about 116,000 oz. of Java Quinine, from the Bandoang factory, were imported into Amsterdam, and chiefly sold privately at from 14½ fl. to 19½ fl. per kilo. or, say, about 9*d*. to 12*d*. per oz. Latest advices state that there is now no stock left in Amsterdam, and nothing has been offered for future delivery. The quality has greatly improved during the year, and new averages between No. 2 and No. 3 of the Dutch Pharmacopœia. During December 100 cases of quinine were exported from Java, of which 50 went to Rotterdam and the remainder to the United Kingdom. Total exports during 1898 were 1,172 cases or 468,800 oz., of which about 94,400 oz. went to Amsterdam, 75,200 direct to New York, 20,000 to Rotterdam, and the rest (say, 279,600 oz.) to London.

Present-giving Tea Trade. An irate Family Grocer writes to the *Grocer* that only one thing more is needed to make the present-giving tea trade a success, namely, some enterprising firm offering "rent and taxes given away with a pound of tea." This would catch on, for it is on this principle that the divi.-paying stores have flourished—by paying out their dividend before rent terms, thus assisting the improvident spendthrift the more-we-eat the-more-we-save class, who are prepared to pay any price for a rubbishy article provided

only they get a big enough dividend. He wonders when the other trades now being encroached upon are going to wake up to this abuse; and asks:—What if some enterprising ironmonger were to lay in a stock of tea and ticket—"With each of our handsome tea kettles at 2*s.* 6*d.* we will give 'for nothing' 3 lbs. of our choice orange Pekoe," &c.

Mr. H. O. Newport. The *Cairns Argus* of 10th ultimo has the following note, under the head of "The New Coffee Expert":—"Mr Howard Newport, the newly-appointed expert in coffee culture to the Government of Queensland, is at present in Cairns, and will be present at the meeting of the Chamber of Commerce, to be held next Tuesday. Mr. Newport has had considerable experience and will be able to impart a good deal of valuable information to those interested. At present Mr. Newport's plans are that he will spend about a month here, during which time he will visit Kuranda, under the guidance of Mr. Mayers, the Russell, Bloomfield, Daintree, and other districts. So far he has only seen Hambledon, and consequently cannot express any opinions. His desire is to see all the planters in the various districts. He arrived from Cooktown last Saturday, having seen all there was to see there."

Japan Tea. A consular report on the Trade of Hioga and Osaka during 1897, states that over 16,000,000 lbs. of tea was exported, an increase of nearly 10 per cent. on the previous year, and about one-seventh of the whole was exported by Japanese merchants direct, instead of through the local foreign firms. It is observed that the increase in the cost of labour and materials is making it difficult to produce teas at a low enough cost to meet the requirements of America for a good sound tea at about 25c. or 1s. a lb. retail; and that unless Japan can supply that demand, the American will probably take some other kind of tea as a substitute, or else take to coffee. Exports from Yokohama amounted to 26,518,298 lbs. About 30 per cent. of the exported from Japan is taken by New York and the Eastern States, 33 per cent. by Chicago and the West, 14 per cent. by the Pacific coast, 22 per cent. by Canada, and the small remainder—less than 1 per cent.—goes to Europe and elsewhere.

The Colombo Tea Market. The *Times of Ceylon* reports that though no great excitement prevailed at the Colombo tea sales of the 8th instant there was keen competition, and the sale went off with spirit. The sale showed an advance all round, but particularly in lower leaf grades of tea. Pekoe Souchongs fetched 37 cents; and Pekoes were readily taken at 41 cents; while Dust, which in former times could be bought for 19 cents, was difficult to get at 27 or 28. Buying for the most part was confined to two or three local firms, who purchased largely. The following is our contemporary's usual official return from the sale room:—At to-day's public sale of tea at the Chamber of Commerce Rooms, about 7,442 pkgs. = 580,318 lbs. were offered, of which about 5,978 pkgs. = 466,530 lbs. were sold. All grades met with keen competition at the auctions, medium and fine teas being in much better demand. Prices throughout the sales, though, were irregular. All common leaf teas again realized very full rates. Among the finest teas in the sale were: Middleton, High Forest, St. John's and Glasgow. Among the low-grown teas, good invoices were offered from: Carney, Rayigam, Clyde, Ruanwella and Rondura.

S. Paulo Stock of Coffee. The following is a translation of the reply that Messrs. Prado Chaves & Co., S. Paulo gave to enquiries of the *Brazilian Review* about the coffee stock in that city: "With regard to your enquiries about the actually existing stock of coffee in this city, we can assure you that there is none. In our depôts here the only coffee is that which, as soon as it arrives, is put into bags and remitted daily to Santos. Besides the coffee which remains in our deposits at the most for 3 days the only coffee stored here is that to be roasted for local consumption. The reason of the difference existing between the coffee that passes Jundiahy and S. Paulo and that which enters Santos is easily explained. The bags we receive are counted twice in the Railway despatches (boletims) that is to say, they are counted, for the most part, in Jundiahy, and this same coffee after it has been put into proper bags and is ready for export, is again counted as coffee sent from S. Paulo! Here is the reason why it is generally believed that there is a stock in S. Paulo, a stock that absolutely does not exist, the difference simply arising from the erroneous method that the Railways employ in furnishing the statistics of entries."

The Adulteration of Coffee. In the House of Commons on 23rd ultimo, Mr. W. Long, President of the Board of Agriculture, asked leave to bring in a Bill to amend the law relating to the sale of food and drugs. The Bill differed from the measure previously introduced by the President of the Local Government Board in this respect—that, whereas two Bills were introduced last year, he proposed to deal with both subjects in one Bill. The Bill was divided into two parts, the first dealing with certain dairy products. In respect of food and drugs, the Bill imposed cumulative penalties for second and third offences, and also made it obligatory that foreign warranty should not be admitted as an excuse unless all reasonable steps had been taken to ascertain that the facts were as stated. The measure was read a first time.

Wild Coffee. Specimens of a wild coffee plant recently found on the top of Soche (British Central Africa) are described as consisting of dry twig with leaves and flowers in full bloom and a few of the dried seeds in parchment. The *C. A. Times* remarks:—"The whole appearance of the plant seems identical with the ordinary coffee, only smaller both in leaves and seeds. The seeds are exactly the same shape and have the same appearance as the ordinary Arabica but are very white. This seems much more near the wild coffee of the East Coast of Africa than any other of the specimens which have as yet come under our notice." Many of the seeds have been planted and they are now growing at the Makungwa (now the Hollandia) Estate at Soche. It is worth noticing again that this plant was found growing under dense shade and that the ripe berries were gathered in October.

THE PREVENTION OF LEAF-DISEASE IN COFFEE.

REPORT OF A VISIT TO COORG

By John Cameron, F. L. S.,
Superintendent of Government Gardens in Mysore.

PRELIMINARY CORRESPONDENCE.

Letter dated 15th August 1898 from the United Planters' Association of Southern India, Madras, to the Resident in Mysore, Bangalore.

I have the honor to inform you that it was resolved at the Annual Meeting of this Association, on 10th instant, that you should be requested to kindly apply to the Mysore Government on our behalf for the loan of the services of Mr. Cameron for the purpose of visiting Coorg and there conducting certain experiments and making investigations with a view to the improvement of coffee cultivation and the prevention of leaf-disease.

The Association has voted a sum of rupees five hundred to be appropriated as far as need be in paying Mr. Cameron's travelling expenses, and it is hoped that when application is made the Mysore Government will kindly depute him on special duty, to do what is desired.

It may be well for me to point out that the results of Mr. Cameron's experiments and investigations would be available for use in the Mysore Province. Coorg has been selected as the scene of operations because it offers particular facilities for the kind of work that is to be undertaken.

Requesting that you will kindly make the necessary application to the Mysore Government and support it with your influence,

"Copy."

(Sd.) HENRY CLARKE,
Registrar.

No. 1867 / Ft. F. 26-96.

Office of the Dewan of Mysore,
Dated Bangalore, *7th September* 1898.

From

The Secretary to the Govt. of Mysore,
General and Revenue Departments,

To

The First Assistant to the Resident in Mysore.

Sir,

In reply to your letter No. 4283, dated the 26th August 1898, forwarding copy of a letter from the Secretary, United Planters' Association of Southern India, applying for the temporary loan of Mr. Cameron's services for conducting certain experiments and making investigations in Coorg with a view to the improvement of coffee cultivation and the prevention of leaf-disease, I am directed to state that the Durbar have much pleasure in directing Mr. Cameron to include Coorg in his tour of inspection during the next cold weather and to conduct the investigation suggested by the United Planters' Association. Mr. Cameron will be requested to arrange details in direct communication with the Secretary to the Association. The Durbar hope that Mr. Cameron's absence in Coorg will not be for more than 2 or 3 weeks.

I have, etc.,
(Sd.) C. SREENIVASAIENGAR,
Secretary.

No. 1868. / Ft. F. 26-96. Dated 7th September 1898, En. 1.

Memo.

Copy of the foregoing, together with copy of the letter from the Secretary to the Planters' Association, is forwarded to Mr. Cameron, Superintendent, Government Gardens, Bangalore, for information and guidance. Mr. Cameron may make suitable arrangements for the discharge during his absence of his duties in Bangalore.

"By order,"
(Sd.) C. SREENIVASAIENGAR,
Secretary.

No. 5117 / 297-98.

From

The First Assistant to the Resident in Mysore,

To

The Dewan of Mysore.

Dated Bangalore, *29th September* 1898.

Sir,

I am directed to acknowledge the receipt of your letter No. 1867 / Ft. F. 26-96 dated the 7th instant, stating that Mr. Cameron has been directed to include Coorg in his tour of inspection during the next cold weather and to conduct the investigations suggested by the United Planters' Association of Southern India. I am to forward a copy of a letter dated the 19th idem from the Secretary of that Association on the subject.

I have, etc.,
(Sd.) K. D. ERSKINE, Captain,
First Assistant Resident.

Letter dated Madras 19th September 1898, from the Secretary, United Planters' Association of Southern India, to the First Assistant Resident in Mysore.

I have the honor to acknowledge the receipt of your No. 4802 of 17th instant, forwarding copy of letter No. 1867 / Ft. F. 26-96 dated the 7th idem from the Secretary to the Government of Mysore, General and Revenue Departments, in reply to my letter of 26th ultimo, applying for the temporary loan of Mr. Cameron's services for conducting certain experiments and making investigations in Coorg with a view to the improvement of coffee cultivation and the prevention of leaf-diseases.

The ready compliance of the Mysore Durbar will be a source of great gratification to the members of the Association; and I venture to request you to convey its cordial thanks to the Durbar, together with an assurance that every effort shall be made to avoid trespassing unnecessarily upon Mr. Cameron's time.

"Copy."
(Sd.) HENRY CLARKE,
Registrar.

No. 2808 / Ft. F. 26-96.

Office of the Dewan of Mysore,
Dated Bangalore, *5th October*, 1898.

Copies of the foregoing are forwarded to Mr. J. Cameron, Superintendent, Government Botanical Gardens, Bangalore, for information, in continuation of this office No. 1868 / Ft. F. 26-96 dated 7th September.

"By order,"
(Sd.) L. ANANTASAMI RAO,
For Secretary.

No. 120.

Dated Bangalore, 27*th October*, 1898.

From

The Superintendent, Government Gardens,
Bangalore.

To

H. G. Parsons, Esq.,
Honorary Secretary,
Coorg Planters' Association.

Sir,

With reference to the enclosed copy of instructions received from this Government, I have the honor to inform you that I hope to arrive at Hunsur, *en route* to Coorg, on the 14th proximo and would be ready to start from the former place on the morning of the 15th.

From the latter date my services shall be placed at the disposal of your Association for a period of at least a fortnight. Trusting that this arrangement will meet your convenience,

I have, etc.,
(Sd.) J. CAMERON, Supt.,
Government Gardens,
Bangalore.

REPORT.

ARRIVAL IN COORG.

My arrival in the province on the 15th November was happily timed, as the N. E. monsoon had just subsided, and the country was, therefore, seen to the best advantage.

Coffee was also in its prime, crop beginning to ripen in the drier and more exposed parts of the planting zone.

Mr. Parsons, Honorary Secretary of the Coorg Planters' Association, who had kindly made all arrangements for my tour, met me at the Pollibetta Club, and accompanied me to his fine residence at "Beechlands," which subsequently became the base of operations in South Coorg, or what is locally known as the "Bamboo" district.

During the following fifteen days of inspection and touring, I must have passed through 50 miles of fine coffee in full bearing, most of it in the "Bamboo" being in one continuous stretch.

The crop this season is also considered well above the average. It is needless to say that this was an unique and impressive sight such as one does not forget. A sight such as the former rulers of Coorg had never dreamed of!

It is also my first experience of the kind, as on former occasions when visiting planting districts in Manjarabad, South Wynaad and the Niligiri Hills, the coffee was not in crop.

PHYSICAL ASPECT OF THE COUNTRY.

Coorg is a hilly plateau girt on the west and south by the western ghats, the highest boundary peaks being Subrahmanya in the north (5,548 feet), Tadiandamol in the west (5,68″2 feet), and the Brahmagiris in the south (4,500 feet). It is situated between north latitude 11° 55′ and 12° 50,′ and east longitude 75° 25′ and 76° 14,′ covering an area of 1,585 square miles. Mercara, the capital of the province, occupies a commanding site at an elevation of 3,800 feet. The view from the spot called "Rajah's Seat" is one of the finest I have ever seen. The average elevation of the upper plateau is 3,500, but gently sloping towards the eastern frontier, where the elevation in some places does not exceed 2,700 feet. Minor mountains and hills intersect the whole country beautifully, and are mostly clothed with interesting trees of varying tint. In most parts of the "Bamboo" one feels rather over-shadowed by trees; but commanding situations, as at the Pollibetta Club, Mr. James Gerard's Bungalow, and Elk Hill, afford fine views of this part of the country.

In North Coorg, the finest views observed are at Peremboo Colly, Mr. Salisbury Trelawney's charming place, Mercara, and Hallery, where I was the guest of Mr. and Mrs. Sprott, and had the pleasure of meeting Mr. Frank Mangles, one of the most successful pioneers of planting in North Coorg.

The principal rivers and streams have an easterly course and flow right across the peninsular into the Bay of Bengal. These are the Kaveri,—rising on the Brahmagiri Range at a sacred spot called Tala-Kaveri, or head of the river,—Hemavate and Lakshamanatertha. The Barapole is the principal river flowing to the western coast. Mountain streams are abundant and rapid during the monsoon season, but at other times they are not so apparent, and the planters mostly complain of the difficulty they experience in watering flower gardens around their bungalows during the dry season.

But this is of course due to the bungalows being mostly situated on high ground, where there is less malaria to contend with. The little alpine province of Coorg is justly described as one of the prettiest spots in India.

GEOLOGICAL FORMATION.

The geological formation is eminently favourable to the creation of good soils. This is due both to the mineral constitution of the indigenous rocks and to their age and mechanism. In nearly every part of the country one sees an abundant outcrop of disintegrated rock in all stages of decay, and in coffee lands this valuable material is intimately incorporated with the tilth. It is, in my humble opinion, the backbone of both the soil and the planting industry. Would the latter have progressed for 40 years without this wealth of nutrient matter to support it?

The prevailing rocks consist of gneiss, syenite, and limestone; and a reddish-coloured laterite is plentiful in many localities. The minerals from which a fertile soil is usually formed are strongly in evidence, *e.g.*, felspar (in several forms), mica, hornblende, and possibly augite. Such being the case, I conclude that the inorganic portion of the soil is mostly made up of varying proportions of these mineral ingredients. Of organic constituents, humus is the largest natural deposit. But in the planting districts the general use of special manures has tended to greatly alter the nature of the soil. It will thus be seen that the planter possesses all the crude elements for forming fertile soil of an enduring character, and, judging from the successful cultivation of one exhaustive crop for periods of 30 to 40 years, the nutrient ingredients of this natural soil must be available in proper proportion, although, in all probability they have not been expended lavishly. In his soil, I therefore think, the Coorg planter possesses a very sound investment. Those crumbling rocks will go on liberating (in some proportion to the pressure put upon them) nutrient material for thousands of years.

FLORA AND FAUNA.

Botanically, the whole country is most interesting. But to do justice to this section of natural history required time and equipment for which I was not prepared on this occasion. A list of such known plants as were observed *en route* is appended* to this paper, as also of specimens collected when there was an opportunity. Most attention was given to the arborescent flora, as bearing more directly on the special work in hand. Except in a few isolated instances, the trees in Coorg do not equal the splendid arborescent growth one sees in Manjarabad and other parts of the Mysore Malnad. But this is partly explained when it is remembered that extensive jungles of bamboo (hence the local designation) have been to a great extent replaced by secondary growth. Colonel Welch refers to the extensive and almost impenetrable growth of bamboo in his "Military Reminiscences," 1790—1829. The virgin forest has also been felled to a great extent to make room for special and exotic trees (secondary planting) now favoured for shading and otherwise promoting the growth of coffee. But except for the arborescent growth, with a few orchids and parasites found upon it, the strictly industrial tract is not of great interest to the botanist. For profitable field work he prefers the primeval forest, the Devarakad, riverside and Cadanga, where the indigenous flora is more rampant. The latter position consists of primitive embankments or ancient lines of defence which are found at short intervals all over the country. Weeds of an exclusive kind were observed on several of these mounds, and are possibly due to a difference in the physical or mechanical condition of the soil. A wild or indigenous species of coffee is found in North Coorg. It was first brought to my notice by Mr. Wood, of "Ahtur" estate, who kindly procured me several specimens of the plant in fruit. The only indigenous species hitherto found in the south are *Coffea travancorensis*, W. & A., and *C. Wightiana*, W. & A., the latter being perhaps only a variety of the former. I consider this the most important find during the tour. But the most

* [Will be published later.]

attractive plant seen in quantity, in North Coorg, is the beautiful *Barleria Gibsoni*. The flora of the Sampagi ghat is of a ravishing description, and it is difficult to decide whether wealth of vegetation or beauty of scenery is the most attractive in this glorious spot. Of the fauna I practically saw nothing during my tour. Some of the birds of plumage are exceedingly attractive, and some are very destructive to the coffee. Of the latter class the green barbet, *Thereiceryx viridis*, is one of the worst. Bees are plentiful, and a giant tree having many tiers of honeycombs suspended from its upper limbs is indeed a novel sight. I am told that it is difficult to induce jungle experts (Kurumbers or Kaders) to collect honey from isolated trees owing to the limited means for beating a hasty retreat, if necessity should require it.

SOUTH COORG.

Formerly this region was the home of the bamboo, where it was the admiration of every traveller. But it is now the home of coffee, extending over a continuous area of many square miles. In no other part of India does one find so much coffee cultivated within a limited area. With the exception of a few intervening Devarakads (temple lands) the bulk of the cultivation may be described as an unbroken tract. Wherever one looks, hillside and valley is an unbroken sheet of shining green with thickly clustered berry, the whole being shaded by stately trees. Throughout the tract there is a close similarity in the nature of the shade, or over-growth, as also in the estate roads and boundaries ; so that a stranger has difficulty in finding his way about. The "Bamboo" is much the largest planting district in the province, and possesses about 70 estates belonging to Europeans. In extent these gardens vary from 80 to nearly 500 acres, but in some cases they are not fully planted in coffee. The fact of their being joined on to each other, as already stated, offers facilities for the easy spread of leaf disease and similar pests. The district differs from North Coorg in being 500 feet lower, with mostly an eastern or southern aspect. It is also warmer, somewhat drier, and more uniformly shaded throughout. The soil is rocky near the surface in some parts, while in others there are deep deposits of clay. As a rule the estates are very neatly kept, some of them being demarcated by thriving hedges of the shoe-flower, *Hibiscusrosa sinensis*. Pretty bungalows crest the lower hills, with flowers and other signs of social life about them.

NORTH COORG.

Here the country is of a bolder and wilder type, with mostly evergreen forest at intervals. Coffee estates are fewer in number and more isolated; not in one continuous stretch as in the "Bamboo." It is a more exposed region and the rainfall is comparatively heavy. The natural soil appears to be excellent, and old coffee looks well upon it. I was astonished at the steepness of the land in some parts, but withal in good growth and bearing. The scenery in North Coorg is delightful. Owing to the heavier rainfall and colder aspect, estates are not so heavily shaded as in the south. Taking them all round, the crops were heavier here than in the "Bamboo." There were also fewer complaints of the ravages of the borer, an insect which prefers to bask in the southern sun. The mean annual rainfall for the whole province is 123 inches : but the distribution is unequal, being always heaviest on the west side of the country. In some parts of the "Bamboo" it does not exceed 50 inches.

With the foregoing attempt to show how the Coorg planter is situated in regard to climate, soil, and environment, I shall now proceed to discuss more in detail, some of the vital questions bearing on the future prosperity of the planting industry.

SHADING.

What constitutes the best shade to coffee is still a keenly contested point among planters, and while one warmly recommends the indigenous "Biti"—*Dalbergia latifolia*, another rejects this tree, and, for example, wholly places his trust in the exotic "Silver-Oak," *Grevillea robusta*. But for reasons which shall be explained further on, it is preferable, in my opinion, to employ a selection of trees to shade an estate ; and most planters have adopted this plan either from necessity or choice. The trees mostly favoured for shading coffee are of two classes, *e.g.*, the indigenous and exotic. Their names are as follows :—

Indigenous.

Ficus Glomerata	*Atti.*
Dalbergia latifolia	*Biti.*
Erythrina indica	*Palwan.*
Pterocarpus marsupium	*Honne.*
Lagerstrœmia lanceolata	*Nandi.*
Terminalia belerica...	*Tare.*
Acrocarpus fraxinifolius	*Howlige.*
Cedrela toona...	*Noge.*
Ficus bengalensis	*Alada.*
,, tuberculata	
,, Mysorensis	*Goni.*
,, Tjakela	*Cap basuri.*
,, Tsiela	*Bili basuri.*
,, Asperrima. (Inferior)	*Gargatti.*
Albizzia odoratissima	*Bilvara.*
Artocarpus integrifolia	*Halasu.*
,, hirsuta	*Kad halasu.*
Antiaris toxicaria	

Also some undetermined species.

Exotic.

Erythrina lithosperma	*Mostly young.*
Albizzia moluccana	
Grevillea robusta	
Cinchona succirubra.	*Not classed as shade.*
Pithecolobium saman.	

The correct amount of shade to be maintained on an estate is another matter for which a fixed rule cannot be laid down, as it must of necessity vary according to circumstances. In situations where the rainfall is heavy or regular, soil good, and aspect cool, the shading should be comparatively light. But in the greater part of the "Bamboo" these conditions are somewhat reversed, and particularly in those parts where the soil is light, stony, and sunburnt, it is essential to have heavier shade. In furnishing this protection, however, care has to be taken not to remove an undue proportion of plant food from the staple cultivation, and in places where young shade trees are thickly planted there is the danger of doing this. During the early years of growth, trees of this class draw nearly their whole nourishment from the surface soil, and at all ages the surface roots of trees will contend for a share of its abundant food.

It is true that most saplings will soon establish their leading roots in the subsoil at depths far beyond the reach of the coffee bush, and as they increase in size, this tendency to draw nourishment from the substratum increases until in many fully developed forest trees surface rooting is reduced to a minimum. All other conditions being favourable, it is deep-rooting trees of this class that should be preferred to shade coffee. The only exceptions would be in the case of fig trees, which (probably from their quasi-parasitic nature) do not appear to exhaust the soil to the same extent as other shaders, and leguminous trees, which assist nitrification in the surface soil. On some of the estates visited, sapling trees ranging in age from five to fifteen years were so closely cultivated that the growth of timber almost appeared to be the primary object. On others, having a more advanced growth, the trees had been considerably thinned.

while the remainder had been "lopped up," *e.g.*, pruned from the base upwards, so that the actual shade was far above the coffee. This, again, conveyed an idea of arboriculture, the trunks being so numerous and bare. Of course, the object aimed at of admitting air and light in this way is perfectly sound, but the fact remains that a plantation of young trees is rapidly consuming food which by right belongs to the coffee.

Where the initial mistake has been made of removing the indigenous deep-rooted shade—and it is pretty universal—replanting has been compulsory, as no one now thinks of growing coffee successfully without shade.

But in addition to losing much valuable time in secondary planting, it will be felt that the land is called upon to do double service. This, however, is not the only disadvantage arising from the sudden exposure of forest soil long nurtured under shade. Such treatment causes a revulsion in the chemical action of the soil, and under strong sun-light the valuable process of nitrification is arrested. Possibly this may account for the infertility of long-abandoned coffee lands. It is, therefore, clearly to the planter's interest not to bare the land entirely, but rather by careful selection to retain and make use of the forest trees already in possession. The finest shade, with the least exhaustion to the soil, is provided by deep-rooted umbrageous trees growing at 60, 80, and even 100 feet apart. Specimens of this description are sufficiently abundant in the virgin forest, and planters should always utilise them when making new clearings. It is under shade of this sort, with perhaps a little secondary planting here and there to fill up gaps, where one sees the finest coffee. "Devaracadoo" in the south and "Hallery" in the north, may be quoted as good examples of mixed shade. These fine trees not only indicate the fertile nature of the soil but they also protect and manure it, while reserving the upper stratum for the growth of coffee.

They also drain the subsoil, and extract mineral solutions from the latter, which are indirectly conveyed to the surface soil in the fallen leaf and decayed roots. It is in this reciprocation of mineral food constituents that the use of a variety of good shade trees, in preference to a few, is chiefly commendable. But variety is also needed to produce the light and shade which is so necessary to effect the best results in growing coffee. When in the months of June and July the sun is often obscured for weeks together and the trees are dripping with superabundant water, it stands to reason that dense shade would do harm. Then, again, when tender growth is progressing during the hottest months of the year more shade would be necessary. In other words, conditions vary, as should also the amount of shade on a coffee estate. Different trees cast their leaves at different times of the year, hence the admission of light in a somewhat varying quantity. The greatest amount of exposure should extend from November, when the berry is ripening, until the flowering period, when the young fruit is set; the object being to insure the thorough ripening of the young wood. Naturally this is what happens, as with the cessation of rain the fall of the leaf is hastened and the coffee bush becomes more exposed to the ripening influence of sun-light. I observed that the "Palwan"—*Erythrina indica*—is a favourite shade-tree with many planters, and is looked upon as a fertiliser of the soil. The evergreen species, *Erythrina lithosperma*, is also under trial, although in some cases it is not true to name, being thorny and a doubtful evergreen. *Dalbergia sissoo*, Roxb., is a new shade tree which I have recommended for planting in stony land. Seed can be supplied in quantity from Bangalore, where the tree flourishes.

CULTIVATION OF COFFEE.

It is not my intention to write a treatise on the cultivation of coffee, as every planter is sufficiently skilled in the routine of his particular work, while many are clever experts in the whole industry. But there are certain details of an important nature, bearing on the results of cultivation, on which the opinion of an outsider might be of some value.

Lands selected for the cultivation of coffee are usually of three classes, *e.g.*, virgin forest, *Kumri* and *kanave;* and they are always the best of their kind, due allowance being made for other necessary conditions, such as rainfall, aspect, and shelter from prevailing winds. But forest soil is the best, as also the most enduring under shade. When fully exposed by the entire removal of shade, land of the latter class exhibits extraordinary fertility for a time, but under the influence of full sun-light it gradually becomes less fertile, and coffee eventually dies out. This is due to what might be called adverse circumstances, as, for ages, the soil had been accustomed to a wholly different course of treatment for which it was specially adapted. By its absorptive and retentive nature, a deep vegetable mould is peculiarly fitted for the dual support of forest trees and coffee, from which products there is an unceasing demand for moisture. But with the removal of this natural drainage (absorption by growth) the soil becomes wet, cold, and unfertile; while the influence of intense light induces denitrification and hence a state of at least partial sterility. It will thus be seen that shaded and exposed lands are differently constituted and that the one cannot be merged into the other without causing intermediate disadvantages to the cultivator. The planter now realises that entire felling is the biggest mistake he has made; but he attributes the cause, and perhaps rightly, more to the absence of shade than to a depreciation of the soil. In planting up abandoned coffee-land the growth is often slow and unsatisfactory, even when supported by liberal tillage and manuring; also in putting in "supplies" the reaction caused by undue exposure is sometimes felt. These difficulties I mostly attribute to a want of tone in the soil, caused by the absence of sufficient shade. Secondary plantings of coffee seldom do much until the shade is well up, when, it will be observed, the natural condition of the soil becomes re-established.

When an estate is planted, and during the first few years of its existence, the tillage of the whole land should be deep and thorough. The more the land is opened and aerated at this period the better, as at a later stage of growth when the bushes nearly meet there is both less opportunity and less necessity for deep tillage, should the land be well drained. To recommend draining the side of a steep hill may sound paradoxical, but during my travels I observed such land evidently in need of drainage. Then, where it is not very steep, especially in low-lying ground, a proper system of drainage is a most important factor in the sweetening of the soil.

Humus is not only very absorbent of water but it also retains it like a sponge.

Wherever there is sufficient foothold for soil of this description, plants will obtain moisture and grow readily, a fact which is strikingly exemplified by the steep cultivation at "Abiall" and other estates in North Coorg. But while the drainage system is intended to remove surplus moisture, care must be taken not to increase "wash" on the upper slopes. On a few estates I observed that open drains, a foot or more in depth and only a few feet apart (sufficient to accommodate one row of coffee bushes), were perpendicularly aligned from top to bottom of the slope. Unless the land is very heavy—a stiff clay—I should consider this practice open to question. Drains eighteen inches deep, following a gently sloping contour across the face of the slope, would be better, and would to a great extent intercept wash. The proper distance apart would wholly depend on the nature of the soil.

But as far as can be judged, twelve and eighteen feet are reasonable distances for heavy and intermediate soils. Stagnant water in the soil is a most hurtful thing, and should be removed at any cost.

"Renovation pits," or holes made at intervals for the deposit of weeds, are supposed by some to facilitate drainage. But this is a doubtful function, as the pits have no collateral outlet and soon become clogged with weeds and forest refuse. I should be inclined to call them *brood-beds* for the propagation of fungoid diseases. At anyrate they should not be allowed to supersede a proper drainage system when it is required. Many fig trees possess the advantage of being openers of the soil, a fact which would easily account for the luxuriant growth of coffee under them. The woody, lateral roots of these trees form vacuities and tunnels which readily admit liberal currents of oxygen for many yards around each trunk. This, now, brings me to the all-important question of digging in a plantation. Thorough tillage up to a given limit has already been advocated, and it is also admitted unconditionally that a moderately open tilth is beneficial at all times. But there are other conditions to be taken into account, and I hope to show presently that in the matter of digging, the planter has to decide between two evils. These are (1) the destruction of coffee roots and (2) the closing up of the soil to some extent. The coffee bush is naturally a surface feeder, a position of root-growth which is further strengthened by subdued light and the prevailing practice of manuring on the surface, or very near to it. On productive estates I observed that fine meshes of young roots pervaded the upper soil everywhere, and I contend that the periodical removal of these feeders by injudicious *mamati*-digging would do the estate an incalculable amount of harm. Certainly much more than would be done by leaving the land undisturbed for a season. For routine tillage on an established tote, the *mamati* should be entirely discarded in favour of the fork; which opens the soil lightly without cutting many surface roots. A good argument advanced in support of *mamati*-digging is its efficiency in removing the encroaching roots of trees, which would otherwise take possession of the land. In reply to this, I must refer the reader to what has been written about deep-rooting trees being preferred to all others where coffee is largely grown. When surface-rooting trees are retained for shade (unless they possess special merits, as it has been shewn may be the case) the evil cannot be remedied by surface digging without injuring the coffee, as it is unlikely that in using a *mamati* the ordinary cooly would take the trouble, even if he possessed the skill, to discriminate between the young roots of trees and the roots of coffee. It is rather by the thoroughness of preliminary operations, effectual drainage, and occasional surface forking that the planter can hope to oxygenise his land and thereby maintain its fertility and sweetness. But I can fully sympathise with those who are pestered by the surface roots of voracious trees, and if some implement could be invented to draw these out without doing much damage to the coffee roots it would be a good thing. Lopping off the principal root-limbs and leaving them with their ramifications to rot in the land is not a bad practice. Care must be taken, however, not to kill the tree or needful shade would be lost.

It may here be asked why so much importance is attached to coffee roots being near the surface. The answer is, that all fruit-bearing plants should have their roots well under the influence of light and heat to insure the best results in the production of fruit. This is all the more necessary in the case of coffee, where the soil is thickly covered by a mantle of vegetation. The food-stuffs required for the formation of fruit are not usually procurable in the subsoil, hence the advantage of shallow cultivation. Surface rooting is therefore desirable, although, to support vegetative growth during periods of drought, it is necessary to encourage fairly deep-rooting development also. But in this connection the admission of light, and regulation of growth, is controlled to some extent by careful pruning. I say "careful" advisedly, as the system of pruning which I have seen on some estates (not on the occasion of this tour) leaves much to be desired. It is a truism that bad pruning is worse than none, while hacking and reckless mutilation is often followed by troublesome diseases, such as rotting and canker. The object in pruning coffee is to equalise and encourage the growth of healthy bearing-wood. Anything not capable of giving crop, unless indirectly leading to the formation of crop-bearing shoots, should be removed by clean cutting. If this is done with care, shortly after picking, the soil, bush, and planter will each benefit by the operation. The organic and inorganic substances which combine to form plant food are well known to the intelligent cultivator. What he is more concerned about is whether these substances are present in proportionate quantity and soluble form, as if they are not, the soil will be unproductive. The mere fact that certain constituents are found in a soil is no criterion of its fertility. And when it is remembered that mechanically, chemically, and biologically, soils are subject to ever varying conditions, this is not to be wondered at. Uncertainty as to the natural capabilities of the soil has led to much investigation, and the truths revealed by agricultural research in recent years are not only very encouraging but of the highest importance to the cultivator. He now understands how the defects in a soil can be remedied at the least cost. Indeed a bad soil can soon be converted into a good one.

It has already been stated that the Coorg soils are naturally good, therefore the planting industry was commenced on favourable terms; and bumper crops, obtained without much cultivation, were the order of the day for many years. But as time went on the shrub became less productive, and coffee pests of sorts commenced to attack the cultivation. It was then realised that the natural soil was becoming deficient in something which only heavy manuring could restore, and henceforward, manuring estates became a necessity. What the planter is chiefly interested in at the present day is how to restore to the land, in the cheapest and most efficient form, what his crops remove from it.

Agricultural chemists tell us that only *three* principal substances need be applied in the form of artificial manures. These are *nitrogen*, *phosphoric acid* and *potash*.

WEEDING.

The incursion of weeds on cultivated land has always been looked upon as thriftless husbandry, and generally speaking, we should take that view of it in coffee cultivation also, as the demand made upon the land by tree and coffee roots is already more than it can bear. But the primness of a flower-garden is not required on the estate, and in some exposed soils of a stony nature I instinctively felt that a light covering of weeds would have done good, by cooling the over-heated surface. The prevailing weed in the plantations is *Blumea Wightiana*, DC. (Kan "Gabbu Soppu"). It is an annual herb of rapid growth, and abounds everywhere in two varieties, determined by white and purple flowers respectively. Considerable expense is incurred annually in the destruction of weeds, but the outlay is compensated to some extent by the green manure which is thus secured to the soil.

If weeds of annual duration, such as *Blumea*, have their tops cut off before flowering, they will do no harm to the coffee and comparatively little to the soil. I was favourably impressed by the clean cultivation which mostly prevails all over Coorg.

MANURES.

Valuation of Manures.

The manurial substances at the planter's disposal are of several kinds and may be roughly classed as follows:—

(*a*) Manures having both a direct and indirect action on the soil.

Cattle manure of all sorts.
Green manure of all sorts.
Sewage.
Composts.
Humus top-dressing.
Bones, when largely applied.
Guano do.

(*b*) Such as act indirectly.

Lime.
Marl.
Chalk.
Gypsum.
Salt.

Lime is of the highest importance to coffee land, as in addition to acting beneficially on humus, it is the salifiable base for the process of nitrification.

(*c*) Manures having a direct and comparatively quick action.

Bone-meal, dissolved, and in sulphuric acid, Guano, including fish guano, and flesh guano such as Mr. Petrie Hay prepares at Hunsur.
Oilcake—Poonac, castor, honge, etc.
Nitrate of Soda.
Superphosphates.
Sulphate of Ammonia.
Sulphate of Potash.
Muriate of Potash.
Mineral Phosphates.
Kainit.

A most valuable fertiliser of this class, recently discovered in the *débris* of steel factories in Europe, is *basic slag*.

Of the above named manures I shall now attempt, briefly, to show which are most valuable in providing *nitrogen*, *phosphoric acid*, and *potash;* leaving the cultivator to use his own discretion in a final selection. But manure in name and the substance in reality are often quite different things, and in the case of portable manures at least, I would strongly advise careful analysis.

Nitrogenous Manures.

Nitrogen in its different forms may be said to be present in everything. But for purposes of cultivation we mostly require it in the forms of *nitric acid* and *ammonia*, of which there is often a deficiency in impoverished or over-cultivated soils. It is, therefore, in the application of substances rich in nitrates and nitrites that we are likely to maintain this indispensable constituent in a form suitable to the growth of plants. The fixation of free nitrogen from the air through the combined action of leguminous plants and bacteria is a recent discovery of great value to the agriculturist. Nitrogen abounds in humus, and is found in varying quantity in all decaying organic substances.

The artificial manures which contain it in the largest proportion are nitrate of soda, sulphate of ammonia, Peruvian guano, bones, fish and flesh guanos and oilcakes.

All these are now used on coffee estates.

Phosphate Manures.

Next in importance to nitrogen, as a soil constituent, comes phosphoric acid. But as the latter enters largely into the composition of the coffee bean it is really of almost first importance to the planter. It is fortunate, therefore, that the crumbling rocks of Coorg are well charged with this useful acid, apatite, carbonate of lime, and the decaying felspars being the usual basis for it. Bare, arid tracts with occasional stunted vegetation indicate its scarcity, as plants are unable to grow without it. Coprolites abound in it. In nature, Phosphoric acid is mostly insoluble, occurring as phosphates of lime, alumina, and iron, etc. For convenient restoration to the land we have numerous artificial manures, such as guano, bones, basic slag and all the mineral phosphates. But for quick effect on growth, the soluble superphosphates are the best, especially the double superphosphates manufactured at Wetzlar in Germany.

Potash Manures.

Although not so important to growth and reproduction as the preceding constituents, still, potash is an indispensable factor in the raising of crops. It is naturally abundant in old rocks—especially felspar—in decaying vegetable matter and in the salt-water of the ocean. It is the principal ingredient of the ash when a plant is burnt. Mr. Sprott, of Hallery, burns the noxious *Lantana Camara*, to utilise its potash on the estate. In a country situated as Coorg is, one would think that Potash would never be wanting: dense vegetation, sea influence, and crumbling felspar rocks being natural conditions. Still, the application of this mineral by artificial means has proved highly beneficial, and it can only be surmised that the natural product is in some way slow or defective in action. Sulphate and muriate (chloride) of potash are the two artificial forms in which this mineral is quickly restored to the soil. Dried blood is also good for the same purpose.

Application of Manures.

Having now classified the important manures under their respective headings, it is necessary to say a few words regarding their application to different kinds of land. Soils poor in organic matter are usually the most benefited by the application of nitrogenous manures. But some of the latter, such as nitrates, ammonia salts, and a few organic forms of nitrogen act so quickly on the soil that they should only be applied as top-dressings at the time the crop most requires them. Of this class, nitrate of soda is the most volatile. But bones, guanos of sorts, and oilcake are of slow action, and should be applied some months before they are actually required as food to the plant. Powerful fertilisers, as nitrate of soda and sulphate of ammonia, should always be applied in limited quantity, and, if possible, on two occasions during the growing season. Nitrate of soda is of most value in a comparatively dry season, heavy rain having the tendency to wash it down into the subsoil.

Sandy soils are usually improved by the application of potash. Damp heavy soils, as also such as are rich in organic matter (humus), should have phosphatic manures in preference to all others.

Manures of a quickly soluble nature are best suited to a dry climate, while those of slow decomposition are just the reverse. Mineral phosphates and basic slag require time to ferment in the soil, and should, therefore, be applied several months before they require to be in action.

Superphosphate on the other hand acts speedily, and should be applied as a light top-dressing at two or three intervals during the period of active growth. It will thus be seen that special fertilisers can only benefit crops while active growth is progressing, and when the soil is sufficiently moist to induce chemical action. In the case of nitrate manures the same conditions are necessary to enable the micro-organisms in the soil and roots to work satisfactorily in the production of nitric acid, through the wonderful process called nitrification. It is now known that a fertile soil teems with bacteria, as also the roots of many trees, shrubs, and herbs of the natural order *Leguminosæ*.

Indigenous Manures.

It was pleasing to hear that a few manurial products of the country are growing in favour. These are, in addition to oil-cake, which is universally and deservedly popular, *lime*, *fish guano* from the Malabar coast, and a substance which I shall call *flesh guano*, prepared by Mr. Petrie Hay at the Hunsur works. It consists of the dried fleshy material which is separated from greenish bones in going through the mill, and as

now prepared by Mr. Hay forms a rich compost. If this manure could be prepared on a large scale, and in a somewhat different manner, it would be in great demand as an organic fertiliser. In this connection it may be asked if the millions of carcases (cattle and horses, etc.), annually put away in obscure places could not be applied to a more useful purpose? Being rich in nitrogen and phosphorus, the fish guano of the western coast should be liberally used on estates.

The lime procurable about Hunsur, and in some parts of Coorg itself, is supposed to be of questionable quality for manurial purposes. But this is a matter which chemical analysis would easily decide. In all probability it is better in some quarries than in others. There are two classes of land in Coorg which could be vastly improved by a liberal use of lime. These are the inert forest tracts and clay deposits. The mechanical and chemical action of lime on these rich soils would, in my opinion, be of the greatest value to the planter. Of course, phosphates in the shape of bone meal or otherwise, would, to some extent, have the same effect, but they are more expensive and have practically no mechanical action on the soil. Although not a direct food giver, it must be remembered that good lime is a great manufacturer of plant food.

The free admixture of decaying rocky material, containing felspars, etc., is another means of improving the mechanical condition of heavy soils. Indian cattle manure is much poorer in quality than the farmyard dung of western countries, where much pains are taken to make and preserve the latter. But where cattle are folded and littered on the estate, the manure is of better quality. The bracken fern, *Pteris aquilina*, which contains a good percentage of alkaline matter in its constitution, is an excellent material for littering cattle. The location of this herb is said to indicate the presence of a calcareous soil. It is strange that soils of this class are often improved by light topdressing of chalk and gypsum. In dealing with soils of different sorts, it is necessary to apply such manures as are best adapted to each condition, and the quantity to be applied has to be regulated on the same principle.

Practical experience is much the safest guide, and it is not difficult to conduct such experiments on a small scale in different classes of land.

NURSERIES AND SEED SELECTION.

Preliminary operations on the estate require much care, forethought, and energy; none more so than the selection of sites and formation of nurseries where the young coffee is to be successfully reared. It goes without saying that nursery land should be of the best quality, while specially prepared composts are necessary to provide soluble food for the little seedlings. But this in itself can only maintain and nourish young life. Mere culturable operations cannot prevent or remedy constitutional defects arising from external causes. Thus, although the situation, aspect, and soil of a nursery may be everything that can be desired, it does not follow that the seedlings raised in it are always the best of their kind. For constitutional vigour we have to study race, pedigree, and the quality of individual seeds. This constitutes what is called "selection" of the latter, and when carefully practised is usually the means of improving races or strains of cultivated plants. It is true, purity of strain is sustained by isolation so long as a plant retains its pristine vigour, but it has been observed in the case of many industrial plants that isolation accompanied by much seed-bearing has gradually led to degeneracy and loss of constitutional vigour. To prevent this the seed-bearer should not be allowed to produce more than a limited number of seeds, while the nourishment given should be in proportion to the important work such a plant has to perform. In coffee, seed-bearing can easily be regulated by removing 50 to 80 per cent. of the flower buds, leaving such as are favourably situated on the lower half of the primary.

But without taking special measures, a first picking of the finest beans from all over the estate will also be found useful for the propagation of nursery stock. And if such pickings are exchanged with planters situated in different localities, the results are likely to be better still. In nurseries and seed-farms in Europe, the raising and selection of seed forms a special department of work to which the greatest attention is paid. Small seeds are carefully examined under the microscope, so that only the very best may be chosen for sowing. Thus by eliminating the inferior and encouraging the cultivation of the best at one's disposal, an improved strain of plants will be gradually formed.

VARIETIES OF COFFEE SEEN IN COORG.

The species observed were only three in number, *e.g.*

1. *Coffea Wightiana*, W. & A.; Indigenous.
2. ,, *Liberica*, Hiern., West Africa
3. ,, *arabica*, Linn, Abyssinia.

No. 1 is somewhat sparsely found in North Coorg, and is never admitted into cultivation, I believe. It is a whippy-looking shrub 3—5 feet, leaves thinner, smaller, and more pointed than in *C. arabica*. The reddish-purple berry is also small, but contains two miniature beans of perfect form. There were very few berries on the specimens kindly gathered for me by Mr. Wood. The flower was not seen, but I am told it is much smaller than the flower of *C. arabica*. Of No. 2 Mr. Parsons possesses two, if not three, varieties at Beechlands, the most important being the one known as "Johore-Liberian." On this estate the cultivation of Liberians has been pursued for many years, and I had the pleasure of seeing a large number of fine specimens both in flower and fruit. There are also some seedlings in the nurseries with a distinctly hybrid look about them. Indeed it will be a wonder if natural hybrids are not freely produced on this estate before long. Mr. Parsons also deserves credit for the experiments he has made with grafted coffee. Although results in the latter are not great, the persistence in experiment shows the proper spirit of enterprise.

No. 3 affords the staple coffee of the province, as it does of South India generally. There are several well-marked varieties in cultivation known by the local names of "Coorg," "Chick," "Nalknad" and "Golden drop." Another variety, intermediate between "Chick" and "Coorg," evidently a natural cross, is abundant on the Hallery estate, where it was pointed out to me by Messrs. Mangles and Sprott.

Specimens of the "Golden drop" coffee, were seen at Mr. John Logan's place in South Coorg and also at Santagherry in North Coorg, where Mr. H. F. Davy is Superintendent. Instead of being red when ripe, the cherry in this variety is of a bright golden colour. But the most important variation in coffee is that which improves the size, colour, weight, and quality of the bean, conditions which the planter is no doubt on the alert to discover. It is not likely, however, that much improvement in this direction will occur without greatly enhanced vigour in the plant. In other words, the present strain of coffee should be improved by artificial fertilisation.

CROSSING AND HYBRIDISING.

In my last report on the Lal Bagh, at Bangalore, I have written as follows on the subject of hybrid coffee.

"The possession of hybrid plants on several estates in Southern India now appears to be an undisputed fact. These new forms are reported to combine, more or less, the characteristics of *Coffea Liberica* and *Coffea arabica*, and are only found in localities where the two species have been cultivated and propagated together. They have not been introduced by the planters as new varieties, and were unknown prior to the introduction of the west African species, *Coffea Liberica*. "It is therefore reasonably inferred that these intermediate plants

are true hybrids. The most remarkable thing about them is their immunity from coffee-leaf disease, a condition which can only be attributed to enhanced vitality in the constitution of the hybrid. This is a discovery of much importance to the planter, and will encourage him to pursue the operation of crossing on methodical lines, with a view to raising improved strains of seed, as has already been done in most of the chief products of agriculture and horticulture in Europe. What should be aimed at now is the systematic crossing and re-crossing of different species and well marked varieties until a really good hybrid or cross is produced. With this object, a small coffee-plot has been planted in the Lal Bagh. It consists of 135 bushes in two species and one variety as named in the margin. Most of the plants were of a good size when put down, and it is almost certain that a few of the Liberian and Maragogipe specimens will flower early next year, when crossing operations will be commenced.

Coffea Liberica (Liberian)
" *Arabica* (Arabian)
" *Arabica* (*var.* Maragogipe).

On the occasion of the Planters' Conference at Bangalore last August, the writer had the honor of being invited to attend the discussion on "Scientific Investigation," when the opportunity was taken before the representative planters of Southern India to advocate the advantages of crossing and hybridising coffee with a view to invigorating growth and increasing productiveness.

The same advice has been given in official correspondence with planters, and the institution is generally doing what it can to promote the welfare of the planting industry. Hybrids, or supposed hybrids, have been reported from the marginally noted estates."

Oosoor Estate,	Manjarabad.
Ubban "	"
Koppa "	Kadur Dist.
Panora Peak	S. Wynaad
Kalpatti	do.
Beechlands	S. Coorg.

It is now some years since the operations of crossing and hybridising were first advocated by me, and as time advances, I feel more convinced that in these operations, carefully conducted, we possess a potent means of resuscitating worn-out estates. Without a rotation of crop it stands to reason that coffee will become less productive, unless some radical change is brought about to modify or alter its condition. Change of constitution in a plant really means change of action on the soil as well, and where the effete plant must eventually languish, even under the best of treatment, the newly born one will flourish. Coffee-planting is a special industry which cannot conveniently or profitably be rotated with other cultures; therefore, to keep the plant going for an indefinite period we must change its nature a little, so as to be in harmony with its environment. Judging from the foregoing remarks, and from what has actually taken place on estates where *Coffea Liberica* is established with the older species, there is no doubt but the shrubs, in both cases, are predisposed to cross fertilisation. That important point being settled, it now remains to discuss how a good hybrid or cross is most likely to be produced. This I have already done when lecturing at Mercara and Pollibetta, but it will refresh the planters' memory to reproduce the more salient points here, while the information given under Appendix 1 affords the *modus operandi* of the work in some detail. A definition of the terms "cross" and "hybrid" will be found in the same place. As far as I am aware (but this is open to correction), no artificial cross or hybrid has yet been produced in the genus *Coffea*. At any rate not in this country, and the new or varying forms referred to above are all nature-crosses.

But artificial crossing, done with a definite object, has been productive of many useful and beautiful plants in Europe. Indeed it may be said that horticulture (and agriculture) is to a great extent revolutionised by this means. It is therefore not a fad but a potent reality in the improvement of both economic and ornamental plants. In crossing, the object chiefly aimed at is to reproduce the desirable qualities of two distinct individuals, of different kinds, in the body of one individual. It is not always easy to do this, but it can be and has been done extensively; and is well worth trying as a perfectly feasible means of improving an important and growing industry such as coffee-planting. A hybrid produced from two distinct species is called a "primary hybrid," and succeeding generations, if intercrossed, may become secondary and tertiary hybrids, etc.

When the characters of both parents are pretty evenly blended in the hybrid, the latter may be called the "mean" of the former. But it often happens that the prevailing characters are more approximate to one parent than to the other, in which case we have what is known as a "goneoclinic hybrid." Another way of producing the latter is to cross a hybrid with one of the parent stocks. Ternary hybrids are the indirect offspring of three different species.

It is in the production of the two latter forms (goneoclinic and ternary) that the greatest achievements in hybridisation have been made.

The hybrids naturally produced at Oossoor seem to possess the vegetative vigour of the maternal parent, *Coffea Liberica*, but are deficient in the productive quality of the paternal plant, *Coffea arabica*. To remedy this defect, a cross should now be tried between the latter and the hybrid, as the pollen of *C. arabica* would possibly be more potent in the second degree. In nature there are numerous and beautiful inventions to facilitate the crossing of flowers, but in a paper of this scope it is nexpedient to attempt more than a brief reference to what transpires in the short-lived coffee flower. The latter is structurally hermaphrodite, but not functionally so in every case, as I have observed small insects crawling over the mature stigma before the anthers had dehisced, having pollen from other flowers attached to their legs. I cannot say to what extent this provision is made for cross-fertilisation, but as the flowers open progressively for 24 hours and are visited by swarms of insects at the time of opening and during the receptive period, it is probable that a large percentage of the whole are cross-fertilised.

The active life of the individual flower is of short duration, and possibly within the first hour of its existence it has been fertilised, cross-fertilised, or sterilised. It belongs to the entomophilous class of flowers which are pollinated through the agency of insects, such as small bees, midges, beetles, small moths, and weevils, etc. Dull cloudy days with a lowering of temperature are unfavourable to fertilisation, hence a bright warm day is desirable when the blossom is out.

REVERSION OF HYBRIDS.

This is a matter which troubles the planter a good deal, and possibly causes him to pause before undertaking a series of precarious experiments which involve much time and may lead to nothing in the end. It may, therefore, be said at once that established hybrids of similar strain (slight variations being of little account) do not revert to the parental stock if they are not pollinated by the latter. To maintain purity of strain in a hybrid is simply a matter of protection. Trivial crossing between members of a select group of hybrids—all being very nearly related—is perhaps beneficial on the whole and cannot easily be prevented.

Then, when a really suitable hybrid has been produced, the proper course is isolation from all other varieties of coffee, with a view to inbreeding and seed production. I hope I have made this sufficiently clear, as on these final precautions must rest the success of the whole operation of crossing.

INARCHING.

This form of grafting, like the other, retards vegetative growth and promotes the development of fruit.

The coffee-grafts at Bangalore behave in exactly the same way as mango-grafts; *e.g.*, plant stunted and spreading, fruit

large, and not so plentiful as in the seedling. *C. arabica* on *C. Liberica* is the only combination of any value at head-quarters. Seedlings from the latter have been distributed for trial, and are being cultivated under my own observation. It is possible that some constitutional vigour may be gained from a mechanical connection of this kind, especially where the grafts are interbred. In other respects I do not think that grafted coffee is of much practical value. Some beans exhibited from the inarched bushes here were admired for their size and colour. The operation is chiefly useful in dwarfing vegetative growth, causing early fruiting, and reproducing the true qualities of particular kinds of plants.

COFFEE PESTS.

"We should be happy that it is an industry that involves a certain amount of trouble. Otherwise it would be taken out of our hands altogether.". Such is the pithy and hopeful remark made by an able and experienced planter on the occasion of the last Conference of the United Planter's Association at Bangalore. A statement of this sort indicates the true energy which underlies all the actions of British enterprise.

In the latter case obstacles are of little moment, and may be of real advantage in keeping out the faint-hearted. The same spirit prevails in Coorg, although borer, leaf-rot, leaf-disease, bug and other pests, have each done their best to diminish the planters profits—uncertain crops and foreign competition being a further tax on his patience. Leaf-disease, which is most dreaded, was not very prevalent on any of the estates visited. *Hemileia Vastatrix*, the fungoid parasite which causes leaf disease, by partially or wholly disorganising the functions of the leaf, made its appearances in Coorg in the early seventies, after committing great havoc in the planting districts of Ceylon. The peculiarity of the fungus is that it persistently follows the coffee bush all over the country and is more or less prevalent wherever coffee is grown. A virulent attack on the experimental plot in the Gardens (Lal Bagh), has just been temporarily checked by burning every infected leaf and coating the ground with a thick layer of quicklime.

Combustion, whether active or passive, is the natural enemy of fungoid organisms; and when Mr. Marshall Ward recommended burning everything that could be burnt with safety on the estate, he gave good advice. During the pruning and wood-ripening season, tons of leaves and twigs could be disposed of in this way, although it is admitted that a coffee zone such as the "Bamboo" provides but little space for kindling fires. It is the annual recurrence of the scourge which makes it so disastrous, and anything that would harass it or deprive it of nourishment at critical periods would have the effect of saving the host to a large extent.

Spraying operations were observed at Hallery, where Mr. Sprott thinks he has gained some advantage over the fungus. The mixture in use is 3 lbs. sulphate of copper and the same quantity of lime dissolved in 25 gallons of water.

The Californian remedies for fungoid and other pests are given at the close of this paragraph.

The Life-history of

Hemileia Vastatrix was thoroughly worked out by Mr. Marshall Ward in 1881, and readers cannot do better than refer to his scientific reports, written for the Ceylon Government on the subject about that time.

The Director of Kew Gardens gave it as his opinion, in 1892, that *Hemileia Vastatrix* is a species endemic to the Island of Ceylon. This great authority further adds,—"Like thousands of other microscopic leaf fungi, it probably maintained its existence in an unconspicuous manner in some native Rubiaceous plant (*i.e.*, belonging to the same family as the coffee). It was probably only by a kind of accident that about 1869 it found a suitable host in cultivated coffee, and thus was enabled to develop itself on a scale which speedily made it a scourge." Since the latter date; when first observed, the parasite has followed its host unremittingly to every coffee region of the old world. Change of food would possibly arrest its progress sooner than anything. Slight constitutional change in the host might bring this about, and the process of hybridising would be of much value if it secured even partial immunity to the coffee plant from the attack of *Hemileia*. That such a thing is possible has already been proved by the raising of certain varieties of potato which are wholly immune from *Phytophthora infestans*, the most hurtful fungoid parasite of that esculent.

THE BORER.

The next pest to be briefly considered is the borer (*Xylotrechus quadrupes*), which is indigenous to the country. In fact, there are several borers, and the remedies here recommended will apply to them all. It is only in the more exposed parts of South Coorg that the ravages of these insects are much felt, and even there the conditions are far more hopeful than they were thirty years ago. At that time the wholesale destruction of forest trees, accompanied by undue exposure and indifferent cultivation, aggravated the attack and was the indirect cause of enormous loss to the planter. But it is now understood that sufficient shade and moisture, supplemented by good tillage, are conditions inimical to the spread of borer. The rush for extension which prevailed a few years ago, when prices went up, must be held responsible to a large extent for the maintenance, if not increase, of coffee pests. A large area (in fragments here and there) of unsuitable land was placed under cultivation, and by a process of forcing in some cases and comparative neglect in others it was hoped to increase the average outturn of bean. But a cycle of dry seasons shortly followed, and the new openings were mostly found to be infested with leaf-disease and borer, which rapidly spread to healthy tracts that had not suffered before to the same extent. The occupation of such lands by coffee is therefore a standing danger to the whole local industry. I can imagine nothing more disheartening to a really good planter than to have neighbours who will act recklessly in the selection and treatment of land, to the jeopardy of the whole community. In addition to depth of soil, moisture, and shade, the presence of numbers of insectivorous birds is recommended for the extinction of borer. Of these, woodpeckers, jays, thrushes, mynas, hoopoos, sparrows, larks, jungle fowl, the crow pheasant and many others are insect eaters. When the larvæ can be got at, which is not very frequently, the direct application of neem oil is the surest remedy. If poured into the holes and tunnels caused by the insect, it will either bring out the latter quickly or cause its death inside. In this connection I may mention that neem oilcake, which is manufactured at Hunsur, might have a remedial effect if applied to land affected by borer. Rubbing the coffee stems at intervals with the oil would be a good practice.

LEAF-ROT.

Pellicularia Koleroga, or "leaf-rot," is an epiphytal fungus which envelopes the coffee leaf during the monsoon and subsequently kills it. Continuous or heavy rainfall, density of shade, drip, and stagnation of drainage, are the causes of this fungoid growth. A modification of the above conditions with the use of fire to destroy all affected leaves, and the application of flowers of sulphur in the early stages of attack are the best known remedies. Bordeaux mixture and other fungicides should also be tried. For the eradication of bug and scale insects, the importation of a useful species of lady-bird is under trial. The brown scale-insect, *Dactylopius adonidum*, is prevalent on many of the jungle trees, where it is farmed by ants for the secretion known as "honey dew." It is usually accompanied

by the black fungus *Trisporium Gardneri*, Berk. Kerosine emulsion is a good remedy for these pests.

REMEDIES FOR PLANT DISEASES.

Extract from spraying calendar, Central Experimental Farm, Ottawa.

FUNGICIDES.

Diluted Bordeaux Mixture.

Copper Sulphate	4 lbs.
Quick lime	4 ,,
Paris Green (for leaf-eating insects)	4 oz.
Water (1 barrel)	40—50 gallons.

Dissolve the copper sulphate (bluestone) by suspending it in a wooden or earthen vessel containing 4 or 5 or more gallons of water. Slake the lime in another vessel. If the lime, when slaked, is lumpy or granular, it should be strained through coarse sacking or a fine sieve. Pour the copper sulphate solution into a barrel, or it may be dissolved in this in the first place, half fill the barrel with water, add the slaked lime, fill the barrel with water and stir thoroughly. It is then ready for use.

Stock solutions of dissolved copper sulphate and of lime may be prepared and kept in separate covered barrels thrughout the spraying season. The quanties of bluestone, lime and water should be carefully noted.

Copper Sulphate Solution.

Copper Sulphate (bluestone)	1 lb.
Water	25 gallons.

As soon as dissolved it is ready for use. For use before the buds open only.

Ammoniacal Copper Carbonate.

Copper Carbonate	5 oz.
Ammonia	2 qts.
Water (1 barrel)	40—50 gallons.

Dissolve the copper carbonate in the ammonia. The ammonia and concentrated solution should be kept in glass or stone jars, tightly corked. It is ready for use as soon as diluted with the 50 gallons of water. To be used when Bordeaux cannot be applied on account of staining the fruit. Full particulars given in Experimental Farm Bulletin No. 23.

Corrosive Sublimate.

For potato scab soak the tubers for 1½ hours in a solution of 2 oz. in 16 gallons of water. When dry cut up for planting. Corrosive sublimate is a fatal poison if taken internally. It also corrodes metals. The solution should therefore be made in wooden vessels.

All treated seed should be planted, and any solution left over should be poured into a hole in the ground.

INSECTICIDES.

Kerosine Emulsion.

Kerosine (coal oil)	2 gallons.
Rain water	1 ,,
Soap	½ lb.

Dissolve soap in water by boiling; take from fire, and while hot, turn in kerosine and churn briskly for 5 minutes. To be diluted before use with 9 parts of water.

For bark lice and other sucking insects.

Paris Green.

Paris green	1 lb.
Lime (fresh)	1 ,,
Water	200 gallons

For dry application—1 lb. Paris green with 50 lbs. land plaster, slaked lime or any other perfectly dry powder.

For insects which eat foliage.

Hellebore.

White Hellebore	1 oz.
Water	2 gallons.

Or to be dusted undiluted over attacked plants.

Pyrethrum (or Insect Powder.)

Pyrethrum powder	1 oz.
Water	3 gallons.

For dry application—mix thoroughly 1 part by weight of insect powder with 4 of cheap flour, and keep in a close vessel for 24 hours before dusting over plants attacked.

Extract from the "Mysore Gazette," June 25, 1896.

[The following are some reliable formulæ for the treatment of fungi and insect pests. They have been taken from the Report of the Agricultural Experiment Station of the University of California, and are reprinted here for the benefit of the many inquirers in this country to whom the original reports are not, perhaps, accessible. It should be very constantly borne in mind that "Paris Green" and "London Purple" contain the powerful poison arsenic, and should therefore be used with the greatest caution, especially in the case of plants any part of which is used in the preparation of food or drink.

The same caution applies, though with less emphasis, to "Bordeaux mixture," which contains an irritant copper salt.]

For Powdery Mildews use sulphur, dusting it on the plants.

For Fungi in general use Bordeaux mixture, made as follows: For every 10 gallons take 1 lb. of lime and 1 lb. of bluestone. Dissolve these separately in hotwater and mix when cool adding the rest of the water. Spray on the plants. Or spray with Ammoniacal copper carbonate solution, made as follows: Dissolve 1 oz. of copper carbonate in 6 oz. of ammonia and add 10 gallons of water.

For Fungi and scale insects use lime, salt and sulphur mixture, a winter wash composed of lime 8 lbs., salt 3 lbs. and sulphur 4 lbs. for each 12 gallons of water. mix ¼ of the water, ¼ of lime, and all the sulphur, and boil for 1½ hours; put the salt with the rest of the lime and slake with hot water; add to the above and boil ½ hour longer; add the remainder of the water and apply as a spray.

For scale insects use resin soap as follows: For 100 gallons for summer use take resin 18 lbs., caustic soda (98 percent.) 3½ lbs., and fish oil 2½ pints; for winter use, resin 30 lbs., the caustic soda 6¼ lbs. and fish oil 4½ pints.

The material is put in a kettle and covered with 4 or 5 inches of water. The lid is put on and the mixture boiled two hours or more, and then the rest of the water is added, a little at a time. Spray on the plants. Or use the gas treatment: cover the plant with an oiled tent, and for each 100 cubic feet of contents place in a bowl beneath the tent ⅔ oz. of water, ⅓ oz. of suphuric acid (oil of vitriol), and ⅓ oz. of potassium cyanide (58 per cent.). Be careful not to inhale the poisonous gas, not to allow it to escape from the tent for ½ hour. The leaves may be injured if used during the middle of the day. For insects in general use kerosine emulsion, as follows: Make a soap solution of ½ lb. of soap to a gallon of water. Heat it to boiling and add 2 gallons of kerosine. Pump it through the spray pump, with good pressure, for 5 or 10 minutes. For use add 10 times as much water as you have of emulsion. Apply as a spray. Sour milk may be used instead of the soap solution. The emulsion is made more effective by the addition of a very small amount of arsenic to the soap solution, or of buhach to the kerosine.

For fruit or leaf-eating insects use Paris Green or London Purple as a powder at the rate of 1 to 5 lbs. to the acre, distributed by walking or riding over the field, carrying a pole, at both ends of which are hung muslin bags containing the poison. As a spray use 1 lb. to 200 gallons of water. In spraying these arsenites the nozzle should be held at some distance from the plant and no more should be applied after

the leaves begin to drip. Do not use these on crops where the poison would be injurious to health.

CATCH-CROPPING.

In advanced agriculture much stress is now laid on the desirability of keeping land clothed with crops, direct exposure to sunlight being considered more exhaustive than when the surface is protected. In this connection, I am of opinion that all inferior land attached to estates should be utilised for raising green crops either for its own improvement or to provide green manure to the coffee land. And of the latter, much which is practically unsuitable for coffee might be usefully employed in the cultivation of accessory products. Green manures are so beneficial to poor land that no favourable opportunity of growing them should be lost. The leguminous plants best suited for this purpose are *Mucuna pruriens* var. *utilis;* the Florida velvet bean; *Trigonella Fœnum-Grœcum*—Fenugreek; *Medicago Sativa*—Lucerne; *Indigophera enneaphylla, I. pentaphylla*, and other forms of wild indigo; *Cicer arietinum*—Bengal gram; *Phaseolus Mungo*—green gram; *Dolichos Lablab*—cow gram, and others. The first named is a new plant of which I have distributed some seed in Coorg and elsewhere. In the early operations of planting, especially if the shade is light, the addition of a green crop occasionally would be of benefit to the soil. Catch-cropping in the proper sense, means the sowing of a quickly-growing crop directly after the staple one has been removed, with the principal object of conserving nitrates and other plant constituents which would otherwise be lost from exposure. But coffee is a permanent crop which soon protects the surface soil from undue radiation, so that after the first few years the conditions are very different to what prevails in the cultivation of arable land at home.

OTHER PRODUCTS.

It is beyond the scope of this paper to offer hints for cultivation or to enter into detail on the commercial value of secondary products. Moreover, it cannot be said absolutely that any new culture will succeed until it has been sufficiently tried in various ways. In the "Bamboo" there is no room for other cultures, unless, as has been suggested, the inferior parts of the coffee zone are surrendered for experimental and fertilising purposes. So long as coffee is profitably worked the planter is wise in giving it exclusive attention. Pepper seems to do admirably in some parts, and it seems a pity that more is not grown. But in North Coorg there are facilities for starting new industries such as tea, fibre, and paper factories.

Mr. Parsons showed me a new tea opening in the Sampaghi Ghat which looks promising in the initial stage. The nurseries are in splendid condition and do great credit to the management. Cardamons should do well in the evergreen forest, although very little is produced. Other likely products are Camphor, Vanilla, China grass, Nutmeg, Rubbers (Pará, Indian, Central American,) Castilloa, and Ceará. The demand for *Cinchona succirubra* has gone up considerably and may be worth noting. Indian paper-grass, *Ischæmum augustifolium*—better known in the North as "Bhabar grass,"—would possibly do well on the grassy slopes of North Coorg. The consumption of paper is so great that the Indian supply is quite unequal to it.

In a cool station like Mercara, the Australian *Coniferæ* would succeed, as also the Moreton Bay Chestnut, *Schinus molle*, *Salix Babylonica*, and numerous other ornamental trees which would add to the interest and beauty of the place. I am of opinion that mahogany would also grow well.

SUMMARY.

In conclusion, I shall briefly emphasise what has gone before thus endeavouring to show in the fewest possible words what is best for the planting industry. To attain success, it must be admitted candidly that the industry has entered the forcing stage, a condition which has been hastened, in most cases, by indiscretionary treatment of the land in the beginning. What was wasted and taken from nature as a free gift, has now to be returned with more than compound interest, and it will take a long time, if ever accomplished, to readjust the debt. The planter who can return to the land a liberal percentage of his profits, will sustain the forcing system for many years to come, even if no other factor arises to infuse new life into the industry. But I am strongly sanguine that in hybridisation a factor will arise, and that the renovation of coffee is not wholly a matter of soil enrichment. In any case, good cultivation is a *sine qua non* of future management.

The application of proper manure in correct quantity and at the most serviceable time, are things which should be assiduously learned from practical experience.

A table showing quantities of different manures to be applied per acre for different crops is not of the slightest use to the planter, who possesses but one product on many different kinds of soil.

Next in importance to hybridisation and proper culture, the interchange and special selection of seed must take a high place. The coffee fields of the whole planet must be studied with a view to improvement being made by selection, a work which, I am glad to observe, is already being promoted by the Editor of *Planting Opinion*.

There are no magic remedies either for the prevention of pests or the improvement of coffee, but if the methods recommended in this report are correctly and patiently practised, the results, in the long run, should be satisfactory.

It now only remains for me to thank the planters of Coorg, especially the Honorary Secretary of the Association, for the help and courtesy which was everywhere accorded to me.

I have the honor to remain,
Sir,
Your most obedient servant,
J. CAMERON,
Superintendent,
Mysore Govt. Botanical Gardens,
Bangalore.

APPENDIX I.

Extract from "Planting Opinion."

Fertilization of the Coffee flower.

(By J. C.)

A good many planters who will recognise the above initials know that I am keen on the crossing of coffee. Wishing them and others to be equally keen in a work which may eventually lead to the advantage of the whole planting community, I venture to offer a few hints as to how the details of the crossing may be put in motion. The process of fertilization, if confined to individuals of the same species, will only result in producing "varieties" of the individuals concerned. But when it is extended to different species of the same genus, then an intermediate class of plants called "hybrids" are produced.

As this may not be quite clear to all, I shall give a practical illustration. When two bushes of *C. arabica* are growing near to each other and flowering simultaneously, they will be observed to attract many insects of the winged class. It is a marvel where these insects come from in such numbers and at such short notice. But there they are, the whole day, hurrying to and fro from one bush to the other, until, perhaps every newly-opened flower has been visited.

Now, although these insects have been most industrious in their own interests, collecting food and building material, they

chances are that they have unconsciously rendered a signal service to the coffee also, by carrying pollen from the flowers of one bush to that of the other. If they have done this inadvertently or otherwise, the insects have effected cross-fertilization to the extent of producing varieties, or new forms of the two bushes concerned. By excluding the services of the insects altogether, the same results, and even more effectual ones, can be secured by delicate manual operations. But of this further on. The difference between the fertilizing work of insects and that of man consists in its being promiscuous and haphazard in the one case and systematic in the other.

Now if individuals of two distinct species, such as *C. arabica* and *C. liberica*, were to blossom together in the manner described above, exactly the same activity of insect life would be observed, with, perhaps similar results, only that in this case the progeny would be more than a "variety," it would be a "hybrid." Planters know that year after year their nurseries are stocked with seedlings raised from local seed of which a small percentage appear to be new varieties, or at least different from their fellows. They know also that nature is herself responsible for such variation. If the life-history of a number of seedlings was carefully traced, it would be found that while a few differed in the form, size, and texture of the leaf, others in the size and quality of the fruit or habit of growth, the major part would be nearly identical with the prevailing variety on the estate. This is all right where the prevailing strain is good. But where the product for which a plant is cultivated shows signs of exhaustion, or has become deficient in quality or quantity, the strain is said to have "run-down," and in all such cases too much individualism in reproduction is undesirable. It is in all probability to prevent this running down of strain or breed that nature insists on cross-fertilization.

Coffea arabica, or Arabian coffee, of which there are several well-defined local varieties known by such names as "Chick," Coorg and "Nalknad," has been almost exclusively cultivated in this country from the time the industry was started, and it is only within recent years that one or two new varieties and species have been introduced and cultivated on the estates. This fact will explain the absence of hybrids over such an extensive area, there being no material to make hybrids from. Yet, within the past few years, some hybrids have made their appearance, shortly following the introduction of Liberian coffee, a distinctly new species. And, barring the fact that two distinct species have been placed in juxtaposition to each other, the hybrids are the work of nature. But in the instances referred to, man must get the credit of having materially helped nature by providing a new species for the latter to work upon.

If he would, therefore, do more in this direction, the chances are that worn-out strains of coffee would soon be replaced by better kinds.

This leads me on to the suggestion that approved varieties and new species of coffee should be freely introduced from other countries. The field for experiment would then be much widened, as planters would have sufficient material to work upon.

The cultivated forms of coffee in different parts of the world are already so far advanced of the indigenous or wild bush that it would probably be mere waste of effort to bring the latter into experiments, the object of which is to secure further improvement in productiveness and quality. Collections of species and varieties should, therefore, be confined, in the first instance at least, to well known jâts already in cultivation. These I shall leave the planter, being the best judge, to select for himself. Now supposing that some enterprising planter has already secured such a collection of coffee-bearing plants, how is he to dispose of them to the best advantage?

This is a question that I shall endeavour to answer in my next.

With one or two new species of coffee at one's disposal, and a like number of distinctly marked varieties, such as the "Maragogipe," which is an introduced variety (from Brazil) of *Coffea arabica*, an experimental plot could be started on the following lines :—

(*a*) Situation, as regards aspect, soil, water and shade, to be the best the estate can afford. Occasional irrigation will possibly be required to induce the different bushes to blossom together, so that the possession of a perennial water-supply would be a convenience.

(*b*) The crossing-plot need not exceed one-eighth or at greatest one-fourth of an acre in extent, while it is possible that equal results may be obtained by working systematically on a few bushes.

(*c*) In planting up the crossing-plot, an equal number of healthy seedlings of the estate coffee should be thoroughly mixed with the new kinds, so that winged insects may have full play on the whole. But in addition to the general and haphazard operations performed by the insects, a few bushes should be carefully isolated for hand-fertilization. For the latter purpose a few skeleton frames covered with fine muslin would be a sufficient protection, if placed over the bushes before the flowers opened. Plant in a square plot at 6 × 6 feet, so that air may circulate around the bushes freely. The preliminary details which I have emphasised under the sub-headings *a*, *b* and *c* will keep the planter employed for at least two years, or, to be strictly accurate, until a maiden crop of flowers is produced in the crossing-plot.

Then, at this latter stage, the work of fertilization will actually begin, should several distinct kinds of coffee flower simultaneously. Unprotected bushes will be pollinated through the agency of insects chiefly, while the protected ones will be self-pollinated, should no precautions be taken to prevent it. Where bushes are intended for hand-fertilization, it will be necessary in the early stages of reproductive growth to rub off a great many of the young flower buds, so that the inflorescence of an individual may be reduced to a manageable number of flowers. For that matter, the flowers could be reduced to what is borne on a single primary, or to a few clusters of the same. The necessity for this apparently ruthless treatment is contained in the fact that, during the short time the stigma is receptive of foreign pollen, the fertilizer could only pollinate a limited number of flowers with any degree of certainty. It is, therefore, wiser to make sure of getting a few good crosses than to attempt a larger number indiscriminately. Let us now suppose that the operation is about to take place. Having provided himself with the marginally noted requisites, and selected a protected bush to become the seed-bearer, the fertiliser places himself under the protective frame and eagerly watches for the opening of the first flower. Directly the flower opens (usually early in the morning), there will be seen, slightly projecting from its delicate-white throat (tube of the corolla) a bifid or two horned stigma supported by 5—7 arrow-headed anthers on short stalks. At the time of opening, the stigma, which is seen well in advance of the anthers, glistens with a sticky substance which holds fast any powdery matter, such as pollen, that may fall on to it. What the fertilizer has to do at this stage is to dust a little foreign pollen on to it by means of his camel's-hair brush. This done, he instantly, and as deftly as possible, cuts away the 5—7 anthers behind the stigma. But as the anthers are usually closed at this early period, they could perhaps do no harm if they were left. Everything would depend on the behaviour, so to speak, of the stigma towards the new pollen by which it has been fertilized.

A fine camel's-hair brush; small, sharp penknife; small sharp pair of scissors; pocket lens; flowering branch from male parent, with pollen.

The process as described above has to be done with every flower until the primary or clusters of flowers reserved for crossing have been exhausted. A register is then made of the parentage on both sides, and after a day or two the bush is liberated from its protecting covering.

I have examined many coffee flowers at the moment of opening, in most cases the stigma projects in advance of the anthers and the style lengthens rapidly. By this means the spreading horns of the stigma afford a good platform for small bees and other insects to rest upon when searching for honey. Then flitting from one stigma to another they deposit quantities of pollen, which readily adheres to their hairy limbs. Crossing operations being completed, the next step would be to select a suitable piece of land for the cultivation and trial of seedlings raised from the crossing-plot. It is in this final stage of the experiment that the exact result of cross-fertilization would become apparent, and not before.

But the operator needs to possess patience, for among 10,000 seedlings cultivated there may not be one showing real improvement in every respect.

With our limited experience in crossing, it is uncertain what would happen, although there is reason to believe that cross-fertilization would induce beneficial variation in the growth and production of coffee.

The land required for testing seedlings of mixed parentage should be of the best quality, and the cultivation should be on a liberal scale also. Area is a matter for the planter himself to decide, as it depends wholly on the extent of his operations. I do not, however, advocate large areas for mere experimental work. When the seedlings give their maiden crop, it will be seen approximately what merits they possess from a productive point of view. But other merits, which may be roughly termed constitutional, will only become apparent after a lapse of time and under different modes of treatment.

I can readily imagine that a judicious selection of the fittest would prove a most difficult task, even to an expert.

The operations discussed from the beginning until now, when the second generation has borne its first crop of fruit, covers a period of about six years. This is a long time, and some men would doubtless say "is the trouble worth the candle? especially as there is nothing to prove that much good would come out of it." In answer to such a remark, I am pretty firmly convinced that good would come out of it and have already planted up a small crossing-plot with the view of raising hybrids. The plot consists " of 130 bushes, and includes *C. arabica, C. liberica* and the variety—Maragogipe." A few of the bushes are already well advanced in growth, so that the first batch of crossed seedlings may fruit within five years from date. But when matured bushes can be cross-fertilized this season, the results might be known within four years, which is not very long for a young planter to wait. My object, so far, has been to explain the *modus operandi* of fertilization rather than to discuss side-issues bearing on its application to the genus *Coffeæ*. But now, I may refer briefly to argumentative views on the latter question. As the coffee bush possesses a hermaphrodite flower, it may be held by some that crossing is neither possible nor desirable. But it does not follow that a flower is self-pollinated because it contains both sexes. In numerous hermaphrodite flowers the sexes attain maturity at different periods, and in all such cases self-pollination is effectually prevented. That dichogamy prevails to some extent in the coffee-flower is certain, as I have often observed stigmas in the receptive stage when the anthers had not dehisced. I am unable to say, however, if this is a general condition, or if it only happens in occasional flowers. A flower may thus be structurally hermaphrodite and functionally unisexual. Then, the sweet-scented coffee-flower offers great attraction to insects, which is a pretty sure sign that the dispersion of pollen is favoured by Nature. Indeed, the condition of the pollen is such as would adhere readily to the hairy limbs of insects. It is not of the fine powdery kind (so-called dust of flowers) that would be suspended in the air or lightly carried by the wind.

Considered, therefore, from a morphological standpoint there is little doubt but the genus *Coffeæ* is subject to cross-fertilization and that its flowers are entomophilous. Lastly, I wish to dispel the idea that established coffee can be influenced one way or the other by operations of crossing, the results of which are only discovered in a subsequent generation.

But it is highly necessary that the planter should strictly conserve his testing-ground, and not allow any unknown seed to be utilised for estate purposes. The golden rule in the testing or experimental ground is to destroy all inferior forms as quickly as possible.

New strains of seeds reserved for trial could be treated separately until such time as their merits are fully established. This is all I have to say on the fertilization of the coffee flower at present.

LETTERS TO THE EDITOR.

E. LITHOSPERMA NURSERIES.

Dear Sir,—May I be allowed to point out in your columns that the best way of insuring successful *E. lithosperma* Nurseries is to shade lightly and water freely. The beds should never be allowed to dry. The seeds seem very susceptible to driage in the nursery. The seedlings should be grown as quickly as possible as until they have attained a height of a few inches they are very liable to insect ravages.

Arienkow, Shencottah,
8th March 1898. B. Nelson.

GENERAL ARTICLES.

MANICOBA RUBBER IN BRAZIL.

The official report of Consul Benjamin F. Clark of Pernambuco to the United States government has just reached us:

He says: The manicoba plant is grown in the north of Brazil especially in Ceara and Rio Grande de Norte and Parahyba. In price the rubber from those states is second to the seringueira or Pará rubber, and for certain classes of work is preferred to the latter.

The interest in the growth of the plant is steadily increasing through the three states mentioned above, and is also extending rapidly throughout Pernambuco, Alagoas, and Bahia, giving better results with less labour than almost any other agricultural pursuit.

The seed should be planted at the beginning of winter, red or brown soil giving the best results. At the time of planting the soil should be neither excessively dry or wet; once the tree has reached the age of two years it can resist any weather, but, of course, the amount of milk will always more or less depend on the climatic influence

At six years the plant will have reached its maturity, which, is the time best suited for tapping, though this may be begun at the age of two years. After six years the tree will produce annually, until the age of thirty years from 2 to 5 kilograms (4·4 to 11 pounds) of rubber, if in good condition. After thirty years the yield will slightly decrease, the life being at least a century, under fair conditions

The sap is prepared in exactly the same manner as the seringueira of Para, but is of a deeper brown color after smoking.

The way the greater part of the manicoba rubber is produced in the states above mentioned is to simply cut the bark of the tree, letting the sap run in drops to the base, where by the action of the sun's rays it coagulates and forms an irregular solid mass, which is gathered by the natives and sold to the middlemen, by whom it is shipped to America and Europe.

The prices per kilogram range, in the states from 2 to 5 milreis (28 to 70 cents. per 2·2046 pounds), according to quality.

Besides the manicoba, these states produce a great quantity of mangabeira rubber, which is of an inferior grade to the manicoba and is used for covering cables, &c.

Below is given a table of the rubber export from Ceara for the years 1893 to 1897, inclusive :—

	Quantity. * Kilos	Value. † Milreis	Value.
1893 ...	135,569	1,129,742	359 840·66
1894 ...	146,627	1,221,892	$ 242,378-30
1895 ...	146,627	1,592,567	302,587-73
1896 ...	324,327	2,702,725	486,490-50
1897 ...	475,663	3,964,108	594,616-20

—*The Rio News.*

EXPERIMENT WITH COFFEE SEED.

Mr. Kenneth J. Cameron writes to the *Central African Times* :— Most planters are aware that the sooner the seed is sown after it is harvested, the greater its strength for germination, and the longer it remains without being planted this strength declines.

There seems to be some doubt as to the proper way a seed should be sown in the seed bed. Taking a coffee berry containing two seeds enclosed in parchment we find them convex on the outside and flat in the inside. Both beans form an oval with the narrow end towards the peduncle and this narrow end contains the root. The exact spot from which the root springs may be noticed by removing the parchment when we find a light spot slightly to one side of the centre.

Sowing seed with the flat side down or the convex we find that the stem comes up first in a loop or like a hair pin, with the root and seed in the soil. In stiff soil the seed which contains the cotyledons and bud for the future plant is fixed so firmly that the bark and sometimes the stem breaks as it grows upwards

To see which was really the best method to sow the seed I made four experiments.

No. 1. with the flat side down.
„ 2. with the convex side down.
„ 3. with the broad end down.
„ 4. with the narrow end down.

To give them all the same chance I used the lightest and most friable soil.

No. 1 came up first. No. 2 six days after. No. 4 nineteen days after. No. 2 and No. 3 seven days after No. 4.

No. 1 is the most common way to sow coffee seed, but considering that I reversed the position in No. 2 the root did not come through the soil and grow in the atmosphere, it immediately went direct down, as it also did in No. 3 although it came out at the top of the seed in the position it was placed. Nos. 1, 2, 3, came above ground with the usual loop, but No. 4 came straight up with the seed first, but all the same it had for a few days a slight bend or incline. Of course the seeds in all four were sown near the surface.

Why did No. 1 and 2 come up first? Simply because I used *Jadoo*, and to give the other two the same chance of a friable soil I used leaf-mould.

From these experiments I consider No. 4 the best method to sow coffee seed and of course with *Jadoo* if it is procurable. The only objection to No. 4 is the greater care required to see that the narrow end is down, which the natives might be careless about, and another point in its favour is that it would not require to be so deep in the soil; while the narrow end is about ½ inch below the surface the broad end may be almost on the surface so that there is less to retard its upward progress.

With *Jadoo* it would not matter which way the seeds were placed, it being light and friable and having much more plant food gives the seedling extra strength, and in that way is an ideal soil for coffee. Seeing its effect on the seedlings what must it not do if used for a good coffee harvest?

COFFEE DIRECT TO CONSUMERS.

Mr. Robert H. Elliot writes from Cairo to the *Madras Mail* :— All coffee producers must have read with interest that part of your report of the proceedings of the Nilgiri Planters' Association's Meeting of the 27th January which relates to the formation of a Company for selling coffee direct to consumers. My object in writing now is to suggest that this project can only be of the fullest value if the Company undertakes to supply the consumer with roasted coffee, both roasted and ground, and in the shape of unground roasted berries. After having paid much attention to the subject I am convinced that the great obstacle to the spread of the use of coffee as compared with tea is that the former is often available only in the raw state, while the latter is always ready for immediate use. I have been assured on good authority that three-fourths of our British troops in India would prefer coffee to tea if it were supplied to them roasted The fact that the Army and Navy Co-operative Society at Bombay sells a considerable amount of roasted and ground coffee imported from England in tins, is a sufficient proof of what is required by the public in India. The Company then should supply coffee in three forms—raw, whole roasted berries. and roasted and ground. I have shown that coffee is roasted in England and exported to India. and I would suggest that some experiments should be made as to roasting coffee in India and exporting it for sale in England. As coffee could thus be supplied to the English consumer at much less cost, seeing that so many intermediaries would be cut out, I feel sure that the numerous Co-operative Societies in Great Britain would be glad to supply their customers with our Indian produce. The best check to adulteration will be found in thus supplying coffee direct from India, as it would obviously be in a form which would make adulteration difficult, or almost impossible. At present the identity of our Indian coffee is lost the moment it is sold, and all sorts of inferior coffees are palmed off on the public as Mysore or other Indian coffees.

BRAZIL CROPS AND THE COFFEE TRADE.

Commenting on Messrs. W. H. Crossman and Bro's. circular estimating the Brazil Coffee crop at not less than 16,000,000 bags the *Grocer* remarks :—

With the superabundance of the Brazil coffee crops for the present and coming season is indissolubly connected the maintenance of existing low prices. and the course they are likely to take in the near future Judging from statistics alone, and without taking into account the needless and harmful intervention of speculators in what are vaguely styled "Futures," we have no hesitation in saying that the quotations now ruling are as high as are consistent with the natural laws of supply and demand. Not only do stocks of coffee in the principal ports of Europe keep on accumulating—amounting to nearly 227,000 tons on February 1, in remarkable contrast with 178,000 tons last year, and 107,000 tons in February 1897,—but since we are on the eve of receiving liberal arrivals of the new season's crops of East India, Jamaica, Costa Rica, and numerous other places of growth, the quantities on hand are sure to be further swelled, and it will be a herculean task to lift and carry forward so great a weight of supply; especially so, if at the same time efforts are being made for sending up prices to much higher levels, as if the statistical position of coffee all round were the very reverse of what it is known to be by impartial and independent observers of actual events. It may even be reasonably allowed that, under the twofold stimulus of plenty and cheapness, the world's consumption of coffee will henceforth progress at an increasing rate; but it cannot by any means augment so rapidly as to neutralise the gain in production, least of all overtake it; and the natural inference is that, provided no unforeseen circumstance of overwhelming consequence happens to alarm the trade by a sudden and unlooked for cutting off or failure of the Brazil crops, no apprehensions of dearer coffee need be entertained.

Messrs. Norton, Megaw and Co. reaffirm their estimate of 8,000,000 bags for the present Rio and Santos crop, they expecting that the receipts for the balance of the season will average about 11,400 bags.

"CHEESY TEAS."

Messrs. Brooke, Bond & Co. (Ltd.) write to the *Grocer* as follows:—We venture to submit this note to you, as we believe its subject-matter is of serious, practical interest to the majority of your readers who are engaged in the tea trade, whether as buyers, blenders, growers, exporters, merchants, brokers, or dealers. The proportion of so-called "cheesy chests" is undoubtedly increasing. The most disagreeable, malodorous taint, strongly reminiscent of rancid cheese, is due to sappy, immature timber of unsuitable type being used in the manufacture of tea-chests on the Indian and Ceylon plantations. As showing the prevalence of the evil, we append a detailed list of 418 packages which have been rejected for "cheesiness" by our own warehouse inspectors during a period of only three weeks:—

January, 1899.

Date.	Mark.	Chest No.	Extent of Damage.
2nd	Invercauld	73/8	Slightly cheesy.
2nd	Venture	70/81	Mostly cheesy.
2nd	Heeleakah	1020/23	Mostly cheesy.
3rd	Venture	82 93	Mostly cheesy.
3rd	Heeleakah	1135 46	Mostly cheesy.
5th	Gairkhatta	2325/37	Mostly cheesy.
5th	Prospect	754 66	All cheesy.
5th	Heeleakah	1024/41	Mostly cheesy.
5th	Aibheel	2644 60	Mostly cheesy.
5th	Kud Kurmum	159 73	Mostly cheesy.
7th	Venture	94 111	Very cheesy.
11th	Ranicherra	101 2	All cheesy.
11th	Vembenard	1022/4	All cheesy.
12th	Prospect	767 9	All cheesy.
12th	Gairkhatta	2338/41	Mostly cheesy.
12th	Arcuttipore	324/43	Mostly cheesy.
12th	Arcuttipore	1818/21	Mostly cheesy.
12th	Arcuttipore	661/72	Mostly cheesy.
12th	Vembenard	1025 36	All cheesy.
12th	Vembenard	1070 1116	All cheesy.
12th	Venture	112 115	All cheesy.
17th	Prospect	767/9	All cheesy.
17th	Gairkhatta	...	Mostly cheesy.
17th	Ranicherra	...	Mostly cheesy
17th	Dinjan	...	Mostly cheesy.
19th	Gairkhatta	3887 902	Mostly cheesy.
19th	Heeleakah	151/88 184/216	Mostly cheesy.
20th	Ranicherra	—	Mostly cheesy.
25th	Cheroot Malay	—	All leads rotted.

Ceylon.

2nd	Debatgama	3938/49	Very cheesy.
3rd	Debatgama	3950 6	All cheesy.
3rd	Katooloya	211 15	All cheesy.
11th	K. A. W.	181 9	All cheesy.
11th	Etulgama	922 30	All cheesy.
11th	K. A. W.	190 201	Mostly cheesy.
19th	Etulgama	941 6	All cheesy.
19th	Katooloya	87 97 98 100	All cheesy.
20th	Etulgama	931 40	All cheesy.

To us, who have experts ever on the watch for any defective package, and who most carefully examine every one of all the thousands of chests which come into our warehouses every week, there is no possibility of a bad tea being passed into a blend; but in the case of the grocer buyer, who still follows the old-fashioned plan of buying unblended teas, there is grave danger of a more or less tainted package, or part of a package, being unsuspectingly included in a home-made mixture. Such an accident would probably contaminate a whole blend, and, by afterwards disgusting and driving away consuming customers, might cause a grocer grievous loss without, perhaps, his ever realising the reason.

There are two principal practicable remedies. The planters must more carefully select and dry all timbers from which they make chests; and all teas, whether previously "bulked" abroad or not, must be "bulked" in London, all the containing chests as well as all the contained teas being systematically and carefully examined by experts.

We trust you will think that the serious importance of this subject to most of your very numerous readers may justify our troubling you with these somewhat lengthy remarks.

THE SILVER CURRENCY QUESTION & PLANTERS.

Mr. Robert H. Elliot writes to the *Ceylon Observer*:—I have read (in your issue of Feb. 6th) with much interest your careful examination of a Currency policy in relation to the advisability of abandoning poor tea and coffee fields. In the course of your remarks you observe that in Ceylon, "an unusual influx of labour took place during 1898 just as depression had set in, and all further extensions were stopped and orders issued for the strictest economy in all departments." And the policy, you observe, resulted in a decline in the earnings of the labourers. But what caused the depression in 1898? Certainly, it seems to me, not prices, but the fact that whereas at first no one believed that the Government would continue its Currency measure, it became evident by 1898 that the Government was determined to persevere in the suicidal policy of placing India and Ceylon in the worst possible position for competing with other silver-using countries. That prices have probably had little to do with the depression in Ceylon seems evident, if we consider that there has been much depression in Mysore leading to a similar decline in the demand for labour, though fine Mysore coffee towards the close of last year was from 105 to 115 shillings a cwt.—a higher price than in the year previous. The fact certainly seems to be that while capitalists will face great risks which arise naturally out of the circumstances, they will not face those Currency risks which are liable to be created by the notices of partially informed and practically irresponsible Indian officials who have every interest in continuing to force up the rate of exchange.

You ask whether I can give you a case of "deliberate abandonment taking place in any part of India." Certainly, and on my own property. On mentioning this to one of our leading Mysore planters some months ago, he observed "That is just what others are doing too." But this is always the case when any cultivation falls into a state of depression owing either to artificial (as in the Indian Currency cause, or the effect of the sugar bounties) or natural causes. A farmer in Scotland once said to me: "How is it that you who have spent so much of your time in India know exactly what ought to be done here to meet those bad times?" Simply because, I replied, I found that you were doing mostly what we had been often doing in India, making money on the good land and throwing it away on the bad—and that the first thing to be done was to throw the latter out of cultivation. It is good policy in any times to diminish risk by cultivating highly the good and abandoning the inferior land. To adopt any other policy in bad times, and especially in the face of a Currency which is liable to be tampered, and re-tampered with, is certainly not the safest course to pursue.

TEA, &c., COMPANIES.

Tea Corporation (Limited).—A general meeting of the Tea Corporation (Limited) (of Ceylon) was held on Tuesday, the 14th ultimo, at Winchester House, E. C., to receive the report of the Committee of investigation appointed at the general meeting held on December 7, 1898. Mr. C. Gurney presided. The Secretary read the report of the Committee, which stated that the Committee had thoroughly investigated the accounts and the affairs of the company from the date of its incorporation, and are of opinion that since the company have had control of the estates they have been most satisfactorily and economically worked; and they consider that with careful management, and every economy in the working expenses, the company will be brought round to a satisfactory paying basis. . . The Committee are of opinion that the estates are now, judging from the manager's reports, thoroughly sound. Mr. Shand endorsed the statement in the report that with careful and economical management the prospects of the future of the company were satisfactory and encouraging. He found that the net profit for the past six months was about 4150*l*. He believed that for the next six months the company would do even better, and the probability was they would realise for the year about 9000*l*. On the motion of the Chairman, seconded by Mr Smith, the report and accounts submitted to the second annual meeting in December, 1898, were then unanimously adopted.

The Palmerston Tea Company of Ceylon, Limited.—The Annual Meeting of the above Company was held at Colombo on 13th instant, Mr. Sandys-Thomas presided.

The report stated:—

ACREAGE:

Tea in bearing	451 acres.
„ coming into bearing	8 „
„ not in bearing	4 „
Jungle and timber	26 „
Grass, &c.	4 „
	Total 493 acres.

The yield of the tea during the period has been 198,941 lbs., costing 29·55 cents, as against 32 18 cents last year, and realising 46·12 cents per lb as against 50 69 cents. As will be seen from the accounts, the net profits for the year amount to R22,287·73, after writing off the sum of R5,768 22 for depreciation on buildings and machinery. An interim dividend of 2 per cent. was paid on the 10th September, 18·8, absorbing R8,200, and the Directors recommend that a final dividend of 3 per cent. be declared, making a total of 5 per cent. for the year, and leaving a sum of R1,787·73, to be carried forward. Mr. W. Sandys-Thomas visited the estates in January, and found everything generally in a satisfactory condition.

The Roeberry Tea Company of Ceylon.—The Third Annual Meeting of the shareholders of the above Company was held at 3, P.M. on 13th instant, at the office of Messrs. Bois Bros., the Agents and Secretaries, Colombo. Mr. W. H. Figg presiding.

The report stated:—

ACREAGE:

Tea in bearing	542 acres.
„ planted 1896	127¼ „
„ „ 1897	40 „
	709¼ „
Cardamoms planted in 1897 ...	4 „
	713¼ acres in cultivation.

The yield of tea during the period has been 180.390 lbs, costing 30-94 cts. per lb., as against 35-31 cts. last year, and realizing 39·94, as against 38·50 cts. for the same period. On a reference to the accounts, it will be seen that the sum at credit of Profit and Loss Account, including the sum brought forward from last year, is R9,113 65, after allowing for depreciation on buildings and machinery, and out of this sum the Directors recommend that a dividend at the rate of 3 per cent. per annum be declared, absorbing R9,000, leaving a sum of R113·65, to be carried forward to the current year. Owing to very unfavourable weather during the latter portion of the year, the crop fell considerably short of the estimate, which was 200,000 lbs., and the result of the year's working is consequently not so satisfactory as was at one time anticipated. The estimate for the current year is 200,000 lbs., of tea as against an expenditure of R58,390. Mr. W Sandys-Thomas visited the estate on the 21st December last, and found everything generally in a satisfactory condition.

The Horrekelly Estate Company Meeting—The Annual Ordinary General Meeting of Shareholders of the Horrekelly Estates Company, Ltd., was held at Colombo on 13th instant. Mr. C. E H Symons, Chairman.

The Report stated that the accounts of the Company for the year ending 31st December, 1898, shew, after writing off R4,405·80 for depreciation on buildings, plant and machinery, a profit of R23.873 14, which, with the balance of R916·38 brought forward from 1897. and the sum of R58·62 unclaimed balances appropriated, gives a total of R24,848·14 available for distribution The Directors recommend that a dividend at the rate of 6 per cent on the capital of the Company be declared. This will absorb R24.000, and leave a balance of R848·14 to be carried forward to 1899. The crop secured has been a fairly satisfactory one. The mortgage balance of R5,000 has been paid, and the property is now free of encumbrances. The working of the estate for the years 1896, 1897 and 1898 compares as follows (the item of interest being excluded):—

		1896 Rs.	1897. Rs.	1898. Rs.
Expenditure on Estate and in Colombo Office	...	30,463·23	32,066·69	37,014·85
Number of Cocoanuts produced	...	1,548.081	1,400,835	1,437,885
Quantity of Coir Fibre made	Ballots...	23,859	28,553	35,474

EAST INDIAN COFFEE.

The *London Commercial Record*, of 24th ultimo, reviewing the Coffee market, says,:—

The week under review has passed away quietly and uneventfully, markets on the whole favouring buyers. Coffee still shows very little strength; good supplies and prospects of a large crop nip every attempt at a spurt in the bud. Coloury coffees are beginning to come in on a larger scale, but there is very little among the shipments worthy of the name of "fine." The berries, as a rule, are small, and the colour leaves much to be desired. This is decidedly disappointing to all concerned. To the planter, for the values he realises in our markets will fall considerably short of the advance he has received; and to the consumer and dealer, for they want fine East Indian sorts badly. The East Indian coffee season altogether has been a very poor one indeed, the total quantity contracted for on arrival terms being exceptionally small, and the prices realised ruinously low. Many of the best known and much-liked estates failed to create any interest in our market, owing to the exorbitant prices demanded by planters. These estates now begin to arrive in our market on consignment to be sold to the highest bidder. Their quality is so indifferent that it is difficult to understand the extravagant ideas entertained as to their value by their owners. Our trade may certainly congratulate itself on not having secured these estates at a high figure on c.i.f. terms; heavy losses would have been the unavoidable result. Now our consumers can secure their coffees at the market value, *i.e.*, at a reduction of about 25 %, and give the planters a lesson which they are not likely to forget in a hurry It seems to be the general opinion in the market that prices for East Indian Plantation Coffees have not touched the lowest point yet, that, being of indifferent quality, they will have to compete with lower grade descriptions, which at the present moment are several shillings below East Indian. Really fine fetches, owing to its scarcity, very high prices: but a few lots only have come before us so far answering to this description. This year's experience, we fear, will render the arrival business in East Indian Estate Coffee even more difficult than it has been so far, and that is saying a great deal.

AMERICAN TEA STANDARDS—HOW THEY ARE DETERMINED

Mr. Herbert G. Woodworth, of Boston, one of the Board of Tea Experts in the service of the United States Government, recently explained to a reporter of *Boston Transcript* how the Board goes about its work. "By the Act of 1897," said Mr. Woodworth "it is decreed that certain standards shall be established in order to prevent the importation into this country of impure or unwholesome tea, and further, that a Board of seven experts shall be appointed to meet at a stated time in New York to establish standards of every brand of tea which comes to this country. This is done solely to protect the consumer. When these standards have been decided on they are sent to the Secretary of the Treasurer, and after he has adopted them, they become law.

"There are 18 standards in all, and they are determined with great care and thought. Many think that the method used is that of tea buyers, but it really is much more exact and sure. In the first place the Board knows pretty thoroughly which teas are bad and which are good. So the essential task is to decide how poor a tea we can afford to allow the importers to bring into the country. This is our method." And Mr. Woodworth went through the process upon a table before him.

"We take the grade to be examined and into one cup pour tea to the weight of a silver half dime. This is for the single infusion. Into another cup we pour twice that weight for the double infusion. Upon the tea boiling water is then poured and the tea is allowed to steep for about two minutes. From the single infusion we determine the quality of the tea and the grade of the leaf, while from the double infusion we learn of its impurity. This last is shown by the coloured matter in the tea, and the congee, both of which float: Congee is a paste of rice water and tea dust, and its effect is to give the tea a uniform colour This matter of colour, by the way, gives the tea anything but a wholesome quality, and is one that we are fighting all the time. It is seen in the so-called country green

tea, which is coloured by Prussian blue or gypsum. The next step is to smell the tea leaf, after stirring it up with a spoon. In this way we detect any sourness or bad flavour. Then we pour off the liquor and examine the leaf carefully in order to learn what kind of stock is in the tea. A black leaf is one that has been used before or one that is dead; either of which is detrimental to the goodness of the tea. There may be a scum or impure matter upon the leaf. And that is not well. In this manner we decide whether the tea is wholesome and pure.

"The 18 different standards of tea," continued Mr. Woodworth, "represent the poorest teas that can come into the country. Every case of tea which is imported is compared to the standard of its kind, and if it fails to equal it, is thrown out. These standards are sent all over the world to every port of export, and now the exporters do not dare to send inferior tea here, as they used to send it, because they know that it will be condemned. In this way we get much better tea than ever before, and as we every year raised the standards a little, each year sees better and purer tea imported." In speaking of the reports that the American people are rapidly giving up tea drinking and are resorting to coffee, Mr. Woodworth said: "It is true that we are drinking more coffee every year, but not at the expense of tea. There is as much tea drunk at present as there ever was, and if we continue to compel importers to raise the standard of tea which they bring into the country tea drinkers will increase; for good, pure tea is better to drink than anything else."

CINCHONA-BARK AND QUININE.

An interesting circular has been issued by Messrs. C. M. & C. Woodhouse, of 30, Mincing Lane, E.C., regarding the position of cinchona and quinine, which has been causing some talk in commercial circles in London lately. They begin, says *The Chemist and Druggist*, with some rather ancient statistics (1878), which are not quite comparable with the figures of the last ten years as Ceylon and Java cinchona have entirely revolutionised both the prices and the qualities of manufacturing-bark. Columbian barks of 1879 contained 2 per cent. of quinine, the Ceylon and E.I. barks 2 to 3, and the Java barks 5 per cent. In 1879-80, of the 8,224,000 lbs. of bark sent to Europe 6,961,000 lbs. came from South America, 1,172,000 lbs. from India and Ceylon, 70,000 lbs from Java, and 21,000 lbs. from Jamaica. The highest importations into the U. K. (according to the Board of Trade) were in 1886, when 16,281,104 lbs., valued at 1,812,501*l*, was the total; last year (1898) the imports were 5,143,000 lbs., valued at 98,132*l*. In an appendix to the report the firm give a number of interesting tables of statistics. Those in regard to bark show that the world's supply is well maintained. We quote the more important of the figures, which, unless otherwise stated, represent English lbs:—

	1894	1895	1896	1897	1898
Ceylon, exports ...	2,229,261	919,877	1,328,498	591,136	975 784
E. I., exports ...	1,674,833	1,137,420	754,384	816,077	3,090,000
Java, exports ...	9,813,753	9,807,457	11,079,234	9,349,867	12,303,424
U. K., imports ...	6,535.000	3,562,000	3,952,000	2,758,000	5,143,000
U. K, exports ...	6,462.000	3,280.000	2,883,000	2,625,000	3 269,000
Holland, imports ...	10,498,000	8,967,000	10,922,000	9,070,000	11,657,000
Holland, exports ...	6,910,000	7,186,000	10.160,000	12,440,000	11 891,000
Germany, imports...	8,004,000	4,465,000	7,649,000	9,279,000	7,805,000
France, imports ...	1,788,000	1,949,000	2,603,000	2,270,000	2,30 ,960
U S A , imports ...	2,684,000	2.018,000	2,599,000	2,696,000	3,302.128

The French imports for 1898 represent eleven months only. The figures regarding African and South American barks are stated in bales, and are therefore excluded. The most notable point about the above figures is that Holland was accumulating stocks up to 1896, when the exports began to approach the imports, and in 1897 and 1898 the exports exceeded the imports In other words, U. K. and Holland, in 18 3–95, imported 47,622.0 0 lbs. and exported 39,5 4,000 lbs., leaving a surplus of 8,038,000 lbs., and in 1>96-98 the imports were 43.502,000 lbs., the exports 43,26 ,000 lbs the surplus for that period therefore being 234,000 lbs. The stocks in London and Amsterdam at the end of 1895 were 43,597 packages and at the end of last year 32,254 packages, these not including second-hand stocks in Amsterdam. The conclusion that Messrs. Woodhouse come to is that the supply of bark is barely sufficient for the consumptive demand. "Increased shipments from Java will be required to supply manufacturers and make up for the expected deficiency from British East India and Ceylon, and in any case we fancy the days of quinine selling below 1s. per oz. are numbered."

We have on several occasions referred to the world's consumption of quinine as being in the neighbourhood of 10,000,000 oz. annually. There are no absolute data for a true estimate, many of the figures being interchangeable, and they are complicated by bark which is not used for quinine-making. Taking the above line of German imports of bark it is interesting to compare with it the following exports of quinine from Germany—viz., in 1894, 4,927.000 oz.; in 1895, 5,616,000 oz; in 1898, 6,930,000 oz.; in 1897, 8,876,000 oz.; and in 1898, 7,094,000 oz. The exports from France have been well maintained during the period, and amounted to 924,000 oz. last year; while Java exported 3 0,000 oz. (according to Messrs. Woodhouse, but our official figure is 468,800 oz.) Italy is responsible for exports of 86,405 oz, but the exports from the United Kingdom are not declared. We import roughly 1½ million ounces of German quinine yearly, and the United States 2,747,0 0 oz. in 1898. The bark figures scarcely leave British manufacturers anything to work upon (another example of statistical trouble), but we may safely take it that quinine is made in this country, as our manufacturers would not buy bark to pitch it away, and we give the following estimate of quinine production as a deduction from the foregoing figures:—

	Oz.
Germany exported	7,094,000
Germany consumed	500,000
U.S.A. manufactured	3,333,000
France exported	924,000
France consumed	500,000
U.K manufactured and consumed	1,500,000
Java and other countries manufactured ...	1,000,000
	14,851,000

This represents the production of quinine sulphate in 1898. The figure seems excessive, but only a fourth of it is estimated, so that the total cannot be far wrong. As 100 lbs of Java bark yield at least 85 oz of quinine sulphate, last year's exports of bark from Java alone represented 10,000,000 oz. of quinine sulphate.

COCOA IN TRINIDAD.

The following are notes by a Visitor:—

General Remarks on Cultivation.

In the oldest Cocoa growing districts, these estates are situated in the valleys formed by the ridge of hills running along the north of the Island parallel to the coast.

The soil in these valleys was said by many planters to be getting exhausted, and to be giving poorer crops than some of the newer lands opened up more recently.

The centre of the Island has been opened up within the last 20 years, and at the present time, there is a great quantity of young Cocoa just coming into bearing.

It is said to be the richest and most productive part of the Island, the Cocoa estates situated here giving a higher return per tree than elsewhere.

This is a slightly undulating district, and the hills and valleys are clothed with Cocoa trees.

Varieties of Cocoa Grown.—The varieties of Cocoa grown in Trinidad are the Criollo, Forastero and Calabacillo.

The quality of the Criollo Cocoa is better than that of the Forastero, and the Forastero is again better than the Calabacillo variety.

Formerly the Criollo Cocoa was grown in Trinidad, but some 10 years ago, a blight destroyed nearly all the trees, and these were replaced by the hardier Forastero variety from the Main, (probably they would come from the district round Carupano).

The Calabacillo is the commonest kind of Cocoa grown, it is the hardiest variety of tree and gives the largest yield

The Criollo variety gives the smallest yield of the 3 varieties, and the tree is more subject to disease than the other two.

Whilst these 3 varieties exist in Trinidad, the bulk of the trees are strains of the Forastero and Calabacillo, the Forastero variety largely predominating.

In Grenada the Calabacillo predominates; in the west of Venezuela the Criollo is grown.

The various varieties of Cocoa are distinguished by the pods and seeds, the shape of the pods and the size of the seeds.

The Calabacillo has a small round pod—the Criollo a long narrow one—the stalk end being constricted. The Forastero has a long pod without the constriction. The beans of the Criollo Cocoa are round and thick, and when cut are white in the centre and of a sweet flavour. Those of the Forastero are not so round, and flatter than the Criollo beans and when cut, have a purple colour, and bitter taste.

The Calabacillo beans are smaller, flatter and more purple than the Forastero beans. When these beans have been fermented and dried, the Criollo is of a light brown colour, the Forastero a dark brown, the Calabacillo a purple colour. The "break" of the Criollo Cocoa is better than that of the Forastero, whilst the Calabacillo has a more "slatey" appearance when cut across. The commoner varieties of Cocoa require longer fermentation to make them at all palatable (*i.e.*, to remove the bitter taste).

All the varieties of Cocoa bear both red and yellow pods, this being no indication of the quality of the Cocoa.

The value of Cocoa depends upon.

(1) The variety of the tree from which the beans are gathered.

(2) The method of fermentation adopted by the planter.

(3) The quality of the soil on which the Cocoa is grown.

The very finest flavoured Cocoas can only be grown on certain soils.

One planter attributed the quality of his Cocoa to the care that was taken in the selection of the trees and the difference in quality between his and another estate was due to this fact, as they are both grown in the same valley on contiguous estates.

The Criollo Cocoa had been tried, but it was difficult to grow, and the yield was small, consequently the trees had been pulled up.

Seeds have been taken from the trees grown in the Ocumare and Choroni Valleys of Venezuela and planted in other parts of Venezuela and Trinidad, but have not given Choroni Cocoa, and trees from other districts planted at Ocumare in 4 generations produced Ocumare Cocoa.

However, one must not forget that there is only 1-10th of the original strain of Cocoa, if the tree is planted at Ocumare surrounded by trees of the true Criollo type.

Probably it would be safe to say one could grow Cocoa in any West Indian Island, like the average Cocoa produced in any part of the world, but not equal to the best of any particular kind. It would be necessary to take seed from the variety of Cocoa one wanted to imitate, ferment it in exactly the same way, and to take care the flower was not crossed by any local variety growing near.

Formation of an Estate.—The estates in Trinidad are nearly all formed by contractors. That is to say the planter gives a certain portion of his land to a contractor, generally a negro, who clears it and plants the Cocoa trees. He grows plantains and ground provisions between the young Cocoa trees for his own use or for sale.

At the end of five years he hands the land back again to the owner, who gives him 80 cents of $ per tree, according to the arrangement made.

A single contractor generally planted 1,000 trees.

Some planters supply the contractor with seeds bnt generally they are left to provide their own.

When we were in Trinidad, the planters said it did not pay to take the trees over so soon, and some left them with the contractor a year or two longer.

The advantages of the system are its cheapness, but the disadvantages are that unless the contractor is supplied with seed and well looked after, he will put in a common and hardier variety of plant, as it is easier to grow.

Arrangements of an Estate.—The Cocoa trees are planted in lines, some 12 feet apart, whilst every 36—40 feet the Bois Immortelles are planted. In the hilly districts where the Cocoa trees are planted on the steep hillsides they are placed closer together and fewer shade trees are employed This method of planting seemed generally employed throughout the Island, though of course some estates were better lined out than others.

One planter thought a better yield might be obtained per tree by planting the trees further apart.

The Bois Immortelles were used in nearly all cases as shade, though in some places the sand box tree was used instead.

The timber of the Immortelle is valueless, but it has always been found to be the most successful shade tree by the planters.

The manager's or owner's house is generally situated in the centre of the estate and is surrounded by the sweat boxes and drying sheds.

Kind of soil, adapted for the Cocoa estate is a light, loamy one; sandy soil gives a better quality Cocoa than heavy ones. It is essential that the soil should be of some depth.

All the planters in Trinidad said it was not worth while planting old sugar estates, as the soil had been exhausted by the sugar and as there was plenty of virgin soil to be obtained, it was better to clear fresh land than plant that partly exhausted.

Work on an Estate.—This consists, after it has been handed over by the contractor, in the careful weeding of the ground, the pruning of trees the gathering, breaking, fermenting and drying the Cocoa. There is work on an estate all the year round, as the men are employed in pruning and weeding when the picking is over.

Thus a small body of men are constantly employed. and there is no necessity for a large amount of labour at one time, and neither is a very large amount of labour required as on a sugar estate.

Gathering Cocoa.—This is done by the men who cut off the Cocoa pods within easy reach by means of a machette: those higher up they remove by means of the Cocoa hooks which are mounted on long bamboo poles. The Cocoa hook is sharpened at the tip and on the underside of the hook, so that the Cocoa can be gathered by means of a thrust or a pull.

The pods are known to be ripe by their colour, some being green, others red It is not easy to say at first when they are quite ripe, but the men employed soon gain experience and are enabled to tell by the appearance.

When the pod is cut open it is easy to tell whether it is ripe, as in a ripe pod the beans are separated from the shell, but they adhere to it before ripening.

The Cocoa gatherers leave the pods upon the ground where they fall. Women are employed to collect them into baskets.

The women deposit the pods into large heaps at different parts of the plantation.

Breaking Cocoa.—This consists in cutting open the pods and removing the beans. A planter told us that it improved the quality of the Cocoa to leave pods a few days in the heaps on the ground before "breaking," but he said that he always had the Cocoa broken as soon as it was gathered, to prevent it being stolen in the night.

In the other plantations we visited it was generally left three or four days in the heaps on the ground before "breaking."

If the Cocoa is left too long in this manner, it will ferment and go mouldy.

When "breaking" the Cocoa the men take a short knife (*i.e.* machette with the end taken off) and cut the pod in two, throwing the top half on one side and the bottom half (to which the placenta with the beans is attached) into a basket. The beans are removed from the bottom half of the pods by means of little wooden spoons and put into large wicker baskets.

This part of the process is performed by women.

These baskets are emptied into the panniers of the ponies whcih take the Cocoa to the sweat boxes. Whilst breaking on the best estates the brack and decayed beans are put on one side and not mixed with the good Cocoa

Sweat Boxes.—These on one estate were large wooden troughs with a cement bottom some 6 feet square and 4 feet deep arranged in sets of 12 under one roof, there being an opening between the top of the boxes and the roof, and sufficient space between the bottom of the box and the ground to allow of the juices liberated during fermentation to escape. Arrack is put at the bottom of the box and when it is filled with Cocoa, banana leaves are spread over the top with sometimes a lid over all, and most of the sweat boxes we saw were arranged on the same principle. Some had fewer divisions.

The boxes on another estate that they were using held from 30 to 40 bags of Cocoa.

On another the fermenting troughs were arranged somewhat differently. There were 6 side by side with a door opening into each box.

Fermentation.—The method of fermentation was the same all over Trinidad with some slight difference. The difference between an estate mark and a common Trinidad is mainly in the fermentation, the better Trinidad Cocoa being fermented the longest of all.

One planter only fermented 5—8 days. The Cocoa on another estate was fermented 10—12 days, being turned over two or three times. During fermentation the white pulp which surrounds the beans is largely removed—part being used in the process, and part draining away as a liquid at the bottom of the troughs.

NOTES ON GINGER-GROWING.

The Journal of the Jamaica Agricultural Society publishes extracts from a pamphlet by Mr. J. B. Kilmer, of New Brunswick, N. J., on the subject of ginger cultivation in Jamaica. We find therein some valuable facts relating to the methods employed in that island in planting and preparing ginger for the market by the small settlers in the ginger-producing districts. Nor can we avoid noticing how much the local Botanical Department and Agricultural Society are doing to advance cultivation. The absence of similar enterprise in this Presidency is a standing reflection upon the otherwise progressive administration of the Local Government.

The following are excerpts from Mr. Kilmer's observations:—

One of the essential requirements for the growth of this plant is—sunshine. Another requisite is moisture.

The underlying soil (in the ginger districts of Jamaica) is white and yellow limestone, with trappean formation This is covered in some of the nooks or valleys with a pulverent mould or loam deposit several feet in depth. The plant grows luxuriantly in such soil, but will apparently not thrive in marshy soil, nor where there is present more than 10 to 20 per cent. of clay or 30 per cent. of sand.

The Government returns for the whole island give only about 250 acres devoted to ginger. This amount of acreage would not give the amount harvested. But the real cultivation is not in acres, many cultivators having beds varying from 6 feet square up to the size of a building lot. A few cultivate from one to six acres. Large lots are very rare.

From 25,000 to 50,000 of the people of Jamaica are more or less dependent on the ginger crop for such ready money as is essential to maintain their existence.

The ginger planter divides ginger into "blue" and "yellow" from the colour of the rhizome. These are also known respectively as "turmeric" and "flint." The root of the blue is hard and fibrous, and less valuable commercially.

There is also a division into "plant" and "ratoon" ginger. The latter is a product of laziness, and is a return crop secured by leaving a part of the "hand" containing a bud in the ground. Ratoon ginger is smaller in size of hands than the planted, and loses each year in flavour.

Ginger-Planting.

The process of planting differs little from potato-planting. Each finger containing an "eye" or embryo is planted in trenches or holes a few inches below the surface, and about a foot apart. The plant needs plenty of sun, and weeds must be kept down. The growing plant grows to a height of 4 or 5 feet. Its cone-topped flower-stems reach from 6 to 12 inches.

On wet soil, and during very rainy seasons, the root is subject to what is termed "black rotten." The root fills with water, swells in spots, turns black, and emits an offensive odour. In this condition it is attacked by insects and worms, which has given rise to the belief among planters that the rotting is caused by a so-called ginger worm. (It is possibly a fungus disease).

Growing ginger must be well watered. An all-important feature is the rapid impoverishment of the soil that follows the ginger culture. The soil which produces the very highest quality of ginger-realising, perhaps, £[illegible] per cwt. in the London markets—is the very deep, black soil of virgin forest.

Ginger can be and is grown in many places year after year on the same ground. When the soil becomes too poor to grow "white ginger," the "blue ginger" (the inferior variety) can be grown

More depends on the curing of ginger than on the soil. Regularly shaped "hands" command the highest price in the market.

Gathering the Crop.

Ginger is known to be ready for harvest when the stalk withers. This begins shortly after the bloom departs. The rhizomes are twisted out of the ground with a fork. In this operation every bruise or injury to the hands is detrimental to market value.

The hands are thrown in heaps, the fibrous roots are broken off and the soil and adherent matter removed. This must be done quickly after removal from the earth, for, should the ginger be dried with the soil and roots still adhering, the product would not be white; and if it lies in heaps before drying, it will mould. The custom is to throw it immediately into a dish of water; it is then ready for the uncoating or peeling operation. This is done by hand.

Peeling Ginger.

Ginger-peeling is an art. The ginger-knife is simply a narrow-edged blade rivetted to a handle. In large operations the expert peels between the fingers of the "hands." Examination of a transverse section of ginger will show the importance of the operation. There is an outer striated skin, under which there are numerous layers of very thin-walled cork cells. These layers contain numerous oil cells, the oil cells being most numerous at the bud points. The oil contained in these cells, in specimens fresh from the ground is almost colourless, very pungent, and exceedingly aromatic. It becomes yellow very quickly on exposure to the air, and even upon drying without removing the epidermis its delicate aroma is found to be fleeting. On drying the ginger, the contents of these cells appear as a yellow, pitchy mass. (It has been stated that this colouring matter is identical with that of Curcuma.) As this cork layer is the seat of the greatest amount of oil and resin cells, it will readily be seen that the deeper the peeling, so much the more of these substances will be carried away with the epidermis, and more cells opened from which these principles may exude.

As fast as peeled, the roots are thrown into water and washed. The purer the water, and the more freely it is used, the whiter will be the product. Generally a very little water washes a great deal of ginger. The hands are peeled during the day, and allowed to remain in the water overnight. This water acquires a slimy feeling, and, if concentrated, becomes mucilaginous and acquires a warm and aromatic taste. The natives claim that this process soaks out the "fire and poison" from very hot ginger. I placed some pieces in a stream of running water for twelve hours, and succeeded in making them several shades lighter in colour. The sample proved to be less pungent to the taste, and it is quite possible the force of the water carried away some portion of the aromatic principles. A few planters use lime juice in the wash water. This gives a whiter root, having some solvent action on the colouring matter; but, as the lime juice contains saccharine and pectose matter, it prevents drying, and mildew follows. In another experiment I supplied the natives with citric acid, vinegar, and acetic acid. They all worked fairly well, citric acid being the best whitening agent, but it was reported that the process was expensive and troublesome.

It is generally stated that ginger is deprived of its coat by being plunged into boiling water before being scraped. This practice is not used to any extent in Jamaica. Its effect is to swell the starch and bassorin-like gums. I found that after keeping the freshly peeled root-stalks in boiling water for an hour, they were suddenly swollen, and the steam was filled with the aroma of ginger. Under this treatment the coating comes off easily, but, if the action of the boiling water is prolonged, the starch and fibre acted upon, the product dries hard, and the colour is darkened. In fact, what is known as "black ginger" of the market is the result of this process. Ginger is found in the market coated with calcareous matter such as carbonate of lime, &c.; this is said to be to fill a demand for "white ginger." Such a proceeding is apparently unknown among the planters. Well-cured ginger has a decided white coating, and that is all they know about it. It has been stated that it is a common practice to bleach ginger with the fumes of chlorine or sulphurous acid. It may be done in the other parts of the world, but no instance of it is known in Jamaica.

I tried chlorine gas as a bleaching agent, but at best the product was of a dirty yellow colour. By using the fumes of burning sulphur, the whole being partially enclosed in glass, the heat of the sun aiding in the experiment, the ginger was whitened, and mildew prevented. I found, on trial, that it might be of service to place the ginger in a weak solution of chloride of lime before drying; this would aid in bleaching, and prevent mould.

Curing Ginger.

After washing, the process of drying follows. The tropical sun is the drying agent in all cases. Large operators have what is called a "barbecue." This is a piece of ground several feet square bevelled off and laid with stone, and the whole coated with cement

It is placed so as to receive the greatest amount of sunshine. The small planter uses what is called a "mat," consisting of sticks driven into the ground, sawbuck fashion, and across these sticks are laid boards, palm, banana or other large leaves; oftener than otherwise the place for drying is a few palm-leaves spread on the ground.

Careful handlers put their ginger out as the sun rises, and turn it over at mid-day, taking it in at sundown. Rainy or cloudy weather invites mildew. It requires six to eight days for the root to become thoroughly dry. I made several tests to ascertain the loss in weight by drying in the sun, and found the average to be nearly 70 per cent.

The loss in the peeling and drying process takes, some say, 66⅔ per cent., others 80 per cent. So that if the planter lifts 100 lbs. of ginger from the soil, he has, after it has been peeled and dried, say from 20 to 33⅓ lbs. of cured ginger ready for market.

In a portion of the island given almost entirely to the cultivation of this product, a few years ago a wet season prevailed. It was impossible to dry the crop in the sun; as a consequence there was a loss of the crop, followed by a considerable distress among the planters.

During my observations an attempt was first made to dry without removal of the skin coat. This, if successful, would have meant the saving of considerable labour. The product was quite dark, the flavour not as good as that of the sun-dried. By removing a part of the coat the drying was hastened. Dr. A. G. McCatty, a practising physician and owner of a plantation, at my suggestion, placed in operation an American fruit evaporator. It was necessary to use wood as a source of heat, and, partly owing to the high temperature and partly from the ignorance of the operator, the product so far has been rather poor in quality, the colour many shades darker, much of the aroma was lost, and a smoky, burned flavour acquired. Other planters are trying the process on this year's crop.

A curious incident resulted during these experiments. The natives, through prejudice against innovations, boycotted the drying apparatus, and refused to furnish supplies at any price. Experiments were made with calcium chloride as a drying agent. The result did not equal samples produced by the native method of drying in the sun. Attempts made to dry the ginger after first slicing, as might be expected, resulted in great loss of flavour and pungency. My conclusions were that, when well conducted, the native method of careful peeling and curing in the sun would produce a handsomer and a better product than any process yet suggested.

These observations were not undertaken with a view of making any complete analysis, and it was found that a microscopic examination by expert judges was far more reliable than any assay that could be made with the limited facilities present in the ginger fields. A few such examinations were made as follows :—

Ethereal Extract.—Exhaustion of the ginger with ether in a Soxhlet extraction apparatus. The resultant extract, after evaporation of the ether, was dried over sulphuric acid to remove moisture. From this extract the volatile oil was calculated by the loss on drying the ethereal extract at 110 degrees C. for three hours. The only results from this process that seemed to be of value was that the finer grades, when carefully dried, contained a higher percentage of volatile oil.

Ginger dried, without removing the peel, gave somewhat higher results as to volatile oils than the peeled. The loss of this constituent was greater in a product dried by artificial heat, than when dried by sun. The amount of volatile oil found by aforesaid process was :—Lowest, 1 per cent.; highest, 3·20 per cent. The results as to ethereal extract, exclusive or volatile oil or of alcoholic extract from the ether-exhausted residue, seemed to be of little value, the different specimens giving such greatly changing amounts as to afford no guide . . . . . .

The ruling price in Kingston and Montego Bay, for the heap, is 1½d. (about 3 cents.) Heaps purchased by me varied according to quality, but the average weight was from one quarter to half a pound.

The buyers of ginger for shipping are expert and accurate. They grade, sort, and price, with a quick eye and ready touch gained by years of practice. The highest grades are larged-sized hands of light and uniform colour, free from evidence of mildew. This grade is brittle and cracks easily, but broken pieces depreciate the value. Buyers also require the hands and fingers to be firm and full, without wrinkless or spots. They generally assort into four or five grades, that which is shrivelled and small being the lowest. The dark varieties form another ; the heavy, tough, and flinty, a third. These four are finally assorted by placing hands which are small, but of good texture and colour, as one grade ; the larger-sized, well-bleached hands into the highest grades.

The ratoon ginger sorts generally bring the lowest price, as they are small, soft, and soggy, and lack flavour. Ginger gathered green shrivels much in drying, and is less aromatic and pungent than when fully matured. Ginger that has mildewed is spotted, and the mildew starts a decomposition that effects the flavour. Ginger put in bags or laid away before being thoroughly dried will mould and acquire a musty odour and flavour, which it is impossible to remove.

The largest-sized hands are carefully selected by buyers and shipped to special markets, usually to England. I noticed hands weighing as much as 8 oz.; many of them weighing from 4 oz. upwards.

Ginger is packed in barrels for shipment.

ECONOMICS.

The amount of ginger exported from this island during the last ten years is shown in the following table :—

	lbs.
1187	1,121,827
1881	1,141,877
1889	1,002,653
1890 (half-year)	554,193
1891	1,219,197
1892	1,822,331
1893	1,526,884
1894	1,672,384
1895	1,736,460
1896	1,960,609

The yield and profit of the ginger crop depend somewhat upon the nature of the soil. In favourable seasons rainfall, sunshine, planting, care, and curing are also factors. An average yield can be estimated at from 1,000 to 1,500 lbs. dried ginger per acre. In exceptional cases, 2000 lb. have been gathered. There are planters in Jamaica who plant ginger here and there in patches, and gathering as little as 100 lbs. in a year. Ginger is well adapted to the small planter, admirably suited to the peasantry of Jamaica, who, by slow evolution, are passing from serfdom to manhood and independence.

The Botanical Department, through its crops of agricultural instructors, is now going among the people and showing them exactly what may be done in the way of improving their methods of cultivation. The Jamaica Agricultural Society is conducting practical and extensive demonstrations to show the use and value of fertilisers. These have already an important bearing upon this crop. Information recently to hand states that the crop which will be gathered in the coming season (spring, 1898) will probably be the largest ever grown upon this island. This is due to the improvements in cultivation, together with an abundant rainfall. Unfortunately for the ginger planter, a largely increased production will tend to lower prices.

I am aware of the fact that these notes will add but little to the already recorded observations upon ginger. It may be questioned whether such a common article of *materia medica* merits any extended research. We should, however, realise that any drug that holds a name and place in medicine is of sufficient importance to merit our best efforts.

Our knowledge of the changers which take place in crude drugs, due to the methods of preparation, is very meagre. Karl Dieterich (Berichte der Dutschen Pharm. Gesellschaft, 1896, p. 335) says :—

"Thus it is that I am convinced that the study and development of this branch of pharmacy will yield far more than theoretical results, and that the analysis of fresh and dried drugs at different stages will be of great practical advantage in directing the proper manipulations to be employed in producing uniform and superior products"

My convictions are strong that the study of drugs should begin in their habitat and extend to the bedside of the patient. That it is important to know every change that may take place in their cultivation and collection, as well as those incident to their preparation for administration, this seems to be sufficient warrant for these observations taken in the Land of Ginger—Jamaica.

THEORY OF THE FLAMING SWORD.

"Ah, talk of blessings! What a blessing is digestion! To digest. Do you know what it means? It is to have the sun always shining and the shade always ready for you. It is to be met by smiles and greeted with kisses. It is to hear sweet sounds, to sleep with pleasant dreams, to be touched ever by gentle, soft, cool hands. It is to be in Paradise.

"There came a great indigestion upon the earth and it was called a deluge. All the evil comes from this. Macbeth could not sleep; it was the supper, not the murder. His wife talked and talked; it was the supper again. Milton had a bad digestion, and Carlyle must have had the worst digestion in the world. Ah! to digest is to be happy!"

There!—how does that strike you for a burst of eloquence? I quote from Trollope. If there is anything wrong about the theology you must hold him responsible. As for its physiology and pathology (pardon all these "ologies") I can answer for the correctness of these two. And so can millions of people besides me. They speak of the curse of indigestion continually in every language; they groan and writhe under it in every land and climate.

"For many years," says one of this innumerable army of martyrs, "I was obliged to bear as best I could the torments of indigestion. My appetite was practically destroyed. I ate, of course, because one must eat or die! but after meals, I had great pain at the chest and around the sides.

Sleep almost forsook my pillow, and naturally I was tired and exhausted. Sometimes better and then worse, but never free from pain and illness, I lived on with little or no hope of getting well. It is hardly necessary to say that I had medical treatment, yet no real benefit resulted from it. Happily at this time Mother Seigel's Syrup was brought to my notice, and so strongly commended that I laid aside other medicines, which were doing me no good, and began using this one only.

"In a short time I realised a great improvement; food agreed with me and I gained strength. A little later—continuing to take the Syrup regularly as directed—the pains at the stomach, sides and chest wholly ceased, and I have not felt them since. My indigestion was cured at last, and I enjoyed the blessing of health. My son, who suffered severely from rheumatism has been relieved by Mother Seigel's Syrup as by nothing else he ever tried. In gratitude I give you full permission to publish my letter should you desire. (Signed) (Mrs.) Ann Barker, Field Lane, Braughing, Ware, Herts. Oct. 7th, 1898.

It was a fortunate circumstance for Mrs. Sarah Gell, of Melchbourne, Bedfordshire, that one day she had a personal talk with Mr. Smith, the butcher at Rushden. He told the lady that in his opinion if she went on suffering from indigestion and asthma (one of its consequences) it would be because she neglected to use Mother Seigel's Syrup. "And," said Mr. Smith, "I speak from knowledge." She had been ill with this abominable ailment for many years, and had spent time and money in unavailing efforts to obtain relief.

Acting on Mr. Smith's advice, Mrs. Gell began using this remedy at once, and tells the outcome in a letter of which we have room for the conclusion only:—

"I was better almost immediately, and was soon as well and healthy as one could wish to be. Now I keep 'Mother Seigel' in the house and it never fails to help us when needed for any passing complaint." (Signed) Sarah Gell, Oct. 5th, 1898.

Judging from the force of his comment on the disease, I should say Mr. Trollope knew something about indigestion from experience. Most literary people do. To them, and to all other victims, I confidently commend the best remedy yet found—Mother Seigel's Syrup.

MARKET REPORT.

[*By Mail advices of 24th February* 1899.]

COFFEE.

The *London Commercial Record* reports that a generally flat tone has prevailed during the week and prices for most descriptions have been in favor of buyers, except for the small proportion of colonry qualities, for which previous prices have been maintained. Some parcels of Plantation Ceylon sold with good competition at full rates. The further supplies of new crop East India continue to shew a depreciation in quality, and, in consequence, sales have been made with difficulty at a fresh decline of 1s. to 2s. per cwt., a small proportion of fine being sold at about former prices. Jamaica partly quitted at about valuations. The quantity of Costa Rica and Central American kinds offered has been on a restricted scale, and the sales shew a similar variation in prices to other growths. "Futures" have shewn a continued downward tendency and prices are again lower; yesterday the reduced rates resulted in large sale; closing rates are—

London ...	Santos ...	March delivery	... 29s. 6d.
New York ...	No. 7 Rio...	„ „ ...	... 5·35 cents.
Hamburg ...	Santos ..	„ „ ...	... 30¼ pf.
Havre ..	Santos ..	„ „ ..	... 36½ francs.
Holland ...	Good ordinary Java	...	.. 31 cents.

Imports Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.
Tons ...	12,421	9,877	2,859	4,729
	Home Consumption.		Export.	
	1899.	1898.	1899.	1898.
Tons ...	2,058	1,957	2,792	2,478

The preceding figures exhibit—

In the Imports a decrease this year of 1870.

Home Consumption an increase of ..	101 tons.
Export an increase of	314 „
Stock an increase of	2,544 „

Auctions this week have gone off as under:—

Ceylon.—*Plantation.*—28 casks 6 tierces 17 barrels 4 bags mostly sold, smalls 60s. to 67s., low medium to bold rough greenish 68s. to 86s., low middling to middling brownish 102s. to 107., bold and extra bold 104s. to 114s., pea-berry 74s. to 125s.

East India.—1,889 bags mostly sold as follows:—*Mysore*, smalls 42s. to 72s., middling blue 71s. 6d. to 72s., good to fine bold 100s. to 105s. 6d., pea-berry 98s. to 116s.; *Coorg*, smalls 44s. 6d. to 51s., low middling greenish to colory 61s. to 67s., middling to good middling 68s. to 75s 6d., good to fine bold 83s. 6d. to 95s., pea-berry 83s. 6d. to 106s.; *Neilgherry*, smalls 45s., low middling 56s, bold dull colory 80s. 6d., good bold grayish 105s.; *Nelliampathy*, smalls 44s. to 46s., low middling 59s., bold dull green 80s., pea-berry 78s. to 96s.; *Wynaad*, bold dull colory 82s.; *Pulneys*, smalls 57s. 6d. to 61s. 6d., pea-berry 90s. 6d.

Mocha.—30½ bales withdrawn.

Penang.—*Liberian.*—7 bags sold, bold yellow pea-berry 40s.

Jamaica.—Of 210 barrels 514 bags offered 150 barrels 255 bags sold, smalls 26s. 6d. to 37s. 6d., good to fine ordinary greenish 38s. 6d. to 44s., fine fine ordinary to low middling faded gray 45s. to 52s., pea-berry 38s. to 46s.

Costa Rica.—Of 762 bags offered about 280 bags sold, good ordinary dull green 36s. to 38s., middling dull gray 60s., pea-berry 57s. 6d.

Guatemala.—Of 363 bags offered only 60 bags sold, low middling dull green 53s. to 53s. 6d.

Colombian.—1,151 bags mostly sold, smalls 32s. to 47s., ordinary dull pale 32s., fine ordinary gray 40s. 6d. to 44s., low middling greenish 65s. middling to good middling blue and green 57s. 6d. to 64s. 6d., bold dull mottled gray 65s., good blue 68s. to 76s. 6d., fine middling 78s. to 81s., good to fine bold 75s. 6d. to 96s, pea-berry 60s. to 76s.

Mexican.—Of 123 bags offered 56 bags sold, smalls 38s. to 40s.

Peruvian.—66 bags half sold, fine ordinary dull green 41s.

Vera Paz.—405 bags catalogued and 110 bags sold—middling faded green to good middling blue 59s. to 65s.

Venezuelan.—Of 464 bags offered, a small part sold at 45s. to 50s. for fine ordinary to low middling grey.

Salvador.—141 bags withdrawn.

Auctions to-day comprised 677 packages Jamaica, 3,957 bags East India, 59 bags Columbian, 145 bags Guatemala, 145 bags Costa Rica and 278 bags New Granada. The sales went off quietly, Cannon's Mysore and other fine qualities sold well at high prices but the less desirable grades were dull of sale, and in some cases 1s. per cwt. lower.

TEA.

China.—Auctions this week have offered 3888 packages, the greater proportion selling at somewhat irregular but, on the whole, steady prices, viz.:—new make Congou 5¼d to 7½d. Scented Caper 6d to 7d. Scented Orange Pekoe 8½. Panyong 6d to 6½d. Lapsang Souchong 6¼d to 6¾d. Oolong 5¾d to 11d. Moyune Green—Gun-

powder 4⅞d to 1s 1d, Imperial 4d to 5½d, Sow Mee at 5⅞d to 1s 1¼d, Foong Mee 7½d to 9¾d, Hyson 3¾d to 4d, Young Hyson 3d to 4¾d, Ping Suey 5¾d to 6d.

Indian.—Public auctions were of similar dimensions to those held since the commencement of the month, having comprised 41,800 packages, against 42,100 packages in the previous week, and 32,600 packages at this time in 1898.

The demand generally continued good, common to fair Pekoe Souchongs and Pekoes being again in strongest request and often dearer. Dusts and Pekoe Fannings also participated in the advance recently established. Medium Pekoes and Orange Pekoes ruled firm, but there was less disposition to secure Broken Pekoes and occasionally lower rates had to be accepted. From South India 800 packages were catalogued, for the most part of useful quality, and results in sympathy with those of shipments from other districts were more satisfactory.

Including what is advertised for Monday next, 169,800 packages have been printed during the month, contrasted with 134,500 packages, in 1898, making the amount of the crop disposed of to the 28th inst., say 1½ million lbs. more than to the end of February in the season before.

For 32,100 packages on Garden account, 9½d. was obtained against 8½d. per lb. for 23,600 packages, and 9⅞d. per lb. for 28,400 packages in the two preceding years.

Ceylon.—About the same quantity was brought for forward, viz.:—14,100 packages versus 14,600 packages on the 14th inst. and 17,100 packages a year ago.

A better tone was noticeable, the small offerings combined with moderate prospective supplies encouraging purchases. Spirited competition prevailed for leafy kinds, Pekoe Souchongs and Pekoes under 7½d per lb, showing a rise of ¼d to ½d per lb., while medium to fine Pekoes and Orange Pekoes were taken more freely for export at enhanced quotations. Broken Pekoes under 10d per lb. also passed rather better in some instances, though the finer lines did not mark much alteration.

The average has risen to nearly 8¾d per lb. On the 16th inst. it stood at 8½d per lb., while in this period of 1898 it was barely 7½d per lb.

Java.—Slightly over 1,900 packages, chiefly of direct import, were submitted to the trade and received good attention, leaf grades being somewhat higher.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, of February 24th, 1899, states :—

QUANTITY BROUGHT TO AUCTION IN LONDON

From 1st June to Date.

	Indian.	Ceylon.	Java.
1898-1899.	1,288,901 pkgs.	827,415 pkgs.	34,554 pkgs.
1897-1898.	1,260,799 „	876,603 „	30,489 „

42,490 pkgs. Indian
15,124 „ Ceylon
1,924 „ Java
} Total 59,538 packages were offered in public auction this week.

Foreign and Colonial markets absorbed over 62 million pounds of Indian and Ceylon Tea during 1898, an increase over the previous year of 11 million pounds.

The total consumption of Indian and Ceylon Tea in 1898 was 33 million pounds more than in 1896, 20 millions of this quantity being taken by new markets; production during this period only increased 18 million pounds. It is mainly owing to the expansion of these new outlets that the market has advanced from the very low level to which it had been forced down by excessive production in recent years. Should consumption expand, as seems probable, better average prices may be looked for.

Export of Indian and Ceylon Tea (in lbs.) to places outside the United Kingdom from 1st January to 31st December.

Indian.

	1898.	1897.	1896.	1895.
Re-exports from U.K. ...	7,855,495	5,496,539	4,399,640	3,973,531

Direct Exports from Calcutta.	16,746,974	13,253,015	11,659,984	10,511,201
Total lbs. ...	26,029,767	22,198,810	19,206,172	16,815,323

Ceylon.

	1898.	1897.	1896.	1895.
Re-exports from U.K. ...	11,522,434	10,502,178	8,496,663	7,147,086
Transhipments from U.K. ...	1,541,537	2,153,501	1,482,619	983,712
Direct Exports from Ceylon..	23,335,994	16,293,635	13,486,451	11,793,005
Total lbs. ...	36,399,965	28,949,314	23,465,733	19,923,803

Indian. With continued strong demand prices for all grades under about 8d. showed a further advance of ¼d. to ½d. per lb., better grades being well competed for at firm rates. The following averages are worthy of note:—"Seeyok," 1/1 1; "Beheating," 1/6¼; "Poobong," 1/5¾; "Amal. T Co. Dooteriah," 1/4¼; "Assam Fron. Co. Hapjan," 1/3½.

Ceylon. Teas under 8d. rose in value to the extent of nearly ½d. per lb., other grades being firm. The official estimate of the Ceylon Tea crop for 1899 is given as 125 million lbs., against 119,769,071 lbs., and the quantity available for the United Kingdom as 93 million lbs., against 96,133,833 lbs in 1898. Average for week 8·66d., against 7·23d. same week 1898.

Ceylon Tea sold on Garden Account, 1st Jan. to date 1899, 155,730 pkgs., av., 8·16d. 1898, 178,700 pkgs., av., 7·95d.

		1899.	1898.	1897.	1896.
Pekoe Soug.	(Ordinary leaf; fair liquor)	7¼d.	5¾d.	6½d.	6½d.
Pekoe	(Ordinary leaf, little twist; fair liquor)	8d.	6½d.	7⅝d.	7⅝d.
Pekoe Soug.	(Rather bold leaf; indifferent liquor)	6¼d.	4¾d.	5¼d.	5¼d.
Pekoe	(Somewhat bold leaf; indifferent liquor)	6¾d.	5¼d.	6d.	5¾d.

Java. Sales passed with strong competition at a further rise in the lower grades of ¼d. to ½d. per lb., prices being steady for other descriptions. Auctions included several parcels brought from Holland.

CINCHONA.

Amsterdam Bark Market.—The *B. and C. Druggist* remarks :—We have received our report of the results of last week's bark auctions in Amsterdam, and it confirms the main particulars published in our last issue from the telegram received on Thursday last week. It appeared that after the auctions some of the bark which had been credited to the purchases of the chief factories was not bought on their account, and this has had the effect of reducing the purchases of each of the German factories. We repeat last week's table, therefore, corrected by the later information, and now stated in English weights :

English and American Quinine factories (principally).	Brunswick factory.	Mannheim and Amsterdam factories.	Frankfort and Stuttgart factories.	Miscellaneous buyers.	Total sold.	Bought in or withdrawn.	Total offered.
Tons. 4.525 (say 4½)	Tons. 3.673 (say 3⅗)	Tons. 2.951 (say 3)	Tons. 3 197 (say 4⅕)	Tons. 2.969 (say 3)	Tons. 18.564 (say 18¼)	Tons. 3.214 (say 3⅕)	Tons. 21.778 (say 21⅘)

It also appears that part of what is given as sold in the above table was disposed of privately before the auctions, and also that of the 3⅕ tons noted as "bought in or withdrawn" nearly two tons were not put to the hammer, but held in reserve. The bark was divided as follows :—*Succirubra*, 42 tons; *Ledgeriana*, 341 tons; *Hybrid* and other barks, 44½ tons. Of the total thus made, root bark formed 33 tons.

QUININE.

Our last report closed, says the *B. and C. Druggist*, at the point where the result of the Amsterdam bark auctions had been received in London, and with it instructions to the agents for the chief German makes to advance the bulk figure to 1s. 2d. Howard's had withdrawn their standing prices, and on Thursday evening sent out notices of an advance in the *sulphate* to 1s. 6d. in 1 oz. vials (100 oz. lots; 1d. less in 1,000 ozs.) They did not, however, notify any change in the bulk price until later. The advice as to

the bulk price of Howard's *quinine sulphate*, which followed later, made this 1s. 4d. in 100. oz. tins, less 1d. in quantities of not less than 1,000 ozs. The prices of the alkaloid itself and of salts other than sulphate in one-ounce vials, and in small lots were put up to the following figures:

	s.	d.		s.	d.
Quinia	2	4½	Hydrobromate	2	0
Arseniate	2	0½	Hydrochlorate	2	0
Benzoate	2	1½	Salicylate	2	0
Bihydrobromate	2	3	Salicylate (physiologically pure)	2	3½
Bihydrochlorate	2	1½	Valerianate	2	3
Citrate	2	0½			

Since our last the second-hand market has been quiet. It was feared that the result of the Amsterdam auctions might lend activity to the speculative market through its being forgotten that the advance in bark had really been anticipated by the rise in quinine; but these fears have not been justified, and the result has been that probably less than 100,000 ozs. have been sold this week in the second-hand market, most of this being done on Friday and Saturday. The spot price has not got beyond 1s. 2d. for German brands in bulk, and 1s. 2¼d. for May delivery. The German agents are selling in small wholesale lots to "non-speculators" at 1s. 2d.

PEPPER.

Black.—The market is steady but rather quiet—decidedly quiet at the close. On the spot sales have been at $5\frac{5}{16}$d to $5\frac{3}{8}$d for fair Singapore, and at 5d to $5\frac{1}{8}$ for Lampong. For arrival 100 tons Singapore have changed hands, at $5\frac{1}{2}$d February-April shipment, and at $5\frac{15}{32}$d March-May and April-June.

At auction on Wednesday 67 bags Singapore were bought in at $5\frac{1}{2}$d, and 40 bags Penang at 5d. 50 bags fair brown Lampong realised $5\frac{1}{8}$d per lb.

White is firm and in good demand for parcels on the spot. Singapore has been sold at $8\frac{3}{4}$d for fair, and Penang at $7\frac{7}{8}$d. For arrival 100 tons are reported sold, viz., Singapore near at hand at $8\frac{7}{8}$d; Penang near at hand at $7\frac{15}{16}$d, and March-May at $8\frac{3}{16}$d to $8\frac{1}{4}$d per lb.

Public sales on the 22nd inst. offered 241 bags Singapore, 80 bags Siam, and 62 bags Penang, all of which retired unsold with the exception of 7 bags of the first-named description which were placed at $9\frac{3}{8}$d per lb. for fine boldish.

INDIA RUBBER.

The market has been quiet and easier Fine Pará quoted at 4s $1\frac{1}{2}$d. Negroheads neglected and little demand this week, but good medium Rubber is scarce and wanted. No auctions to-day.

CARDAMOMS.

These have been moving freely at the usual premium on last auction rates.

East India Coffee sold in Public Sale since 16th February 1899.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 31st instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Please note the change of address.

Coorg.

Polli Betta, *23rd Mar. Weather.*—Brazen sky, blazing heat, high east wind. Not the least sign of rain. *Crop.*—Some gleaning of old crop still going on, buds still fresh; but rain soon would be desirable. *Labour.*—Some estates have paid off. Nearly all will have done so by first week in April.

SOIL FERTILITY AND LEGUMINOUS PLANTS.

Mr. B. Nelson's interesting letter on the result of his experiments in Coffee-planting without manure should be widely read by planters, not only in Southern India but elsewhere also. Mr. Nelson has been doing what we should like to see all planters do. He has been giving practical application in the East to scientific theories expounded in the West. Not that he is alone in this. We are glad to know that similar experiments have been made in Ceylon with somewhat similar success, and are now being made by other planters in Southern India. In the United States also the agriculturist has begun to recognise the nitrogen-giving properties of leguminous plants. But the trial made nearest to his own estate deserves most attention from the South Indian planter, particularly as it is a trial made in regard to coffee-cultivation, and with leguminous plants that are easily obtainable throughout this Presidency and adjacent to the Native States. We do not for a moment deny the use of chemical fertilisers. In many cases the action of leguminous plants would no doubt be painfully slow, whereas that of chemical manures would be fast. Then, too, the one system of fertilisation is resorted to for

the *nitrogen* it enables the plant to obtain. The other in many cases gives less reliable help in the matter of nitrogen, though it counteracts any deficiency of potash or phosphoric acid, according to the kind of manure employed. Whether an estate can be run on leguminous "manuring" principles alone, or can be worked to greater advantage on a system combining leguminous cultivation and chemical manures, is a matter to be settled by the man in charge. In some cases actual experiment will be necessary before he can arrive at a right decision; in others, he may be able to form a sound judgment from soil analysis or by other methods.

Mr. Nelson has stated how it came about that he gave this "leguminous manuring"—if we may for convenience use an expression that is not literally correct—a trial. But it may be well to impress upon readers who have not studied the matter as he has done, the principles upon which the theory referred to is founded. The object is to fix the free nitrogen that is so abundant in the atmosphere, and to put it in harness, so to speak, for employment in the service of the plant world. It has been definitely determined that the *leguminosæ* family of plants are "born Jehus." They are able by the aid of certain micro-organisms in the soil to fix this free nitrogen and make it available for the use of plants. Nitrogen is the most fickle, unstable and unreliable of the elements of plant-growth It forms no stable compound. It has a never-ceasing tendency to leave its chemical combination. Eminently fitted in this way for the life processes that require continued changes in the plant, it is for the same reason very difficult of control. It is costly, and may be approximately rated as worth three times as much as either potash or phosphoric acid. Even in a fertile soil there is only a limited amount of nitrogen An American authority has stated that in some fertile soils it has been determined that the potash would suffice to produce crops of wheat exclusively for 360 years, the phosphoric acid for 140 years, but the nitrogen only for about 100 years. We may take it, therefore, that replenishment of nitrogen is more frequently required than replenishment of the other two elements just mentioned. Any method or practice that will increase the store of nitrogen in the soil will greatly improve its fertility. Here, then, lies the explanation of one point that the farmer or the planter has to keep in view if he wishes his crops to flourish.

The means he has to adopt to secure what he wants, lie in the cultivation of leguminous plants, and the ploughing in or burying in of these in cases where rotation of crops cannot well be resorted to. As already stated, it has been determined, by careful experiment, that all leguminous plants have the peculiar power of fixing the free nitrogen gas of the air, and changing it to the form of nitrates, in which form it can be readily used by all species of plants. This fixation, as explained by Mr. T. B. Mumford, of the Missouri Agricultural College, "is accomplished by means of a minute micro-organism in the soil, which attaches itself to the root of these plants, causing the development of a small tubercle or swelling, and inside this tubercle or swelling the free nitrogen gas of the air is changed to nitrates." So far as is yet known, the *leguminosæ* are the only plants that are able to fix the nitrogen in this way, in quantities large enough to be of practical importance to the cultivator of the soil. They thus open to us an easy way of maintaining soil fertility. It has been found that the fertility of the soils so far as nitrogen is concerned may be maintained by giving a sufficient number of crops of clover or other *leguminosæ*. Not only this: taking the clover as an instance, we may state that its roots grew deep in the soil, so that it will often find food below the level at which other plants refresh themselves. It then brings the potash and phosphoric acid from the deeper layers of the soil to the surface. Soil fertility is drawn up from the depths, and the roots of plants growing in contact with the soil are continually dissolving the elements of plant food, particularly potash and phosphoric acid, and any crop grown upon the soil for the purpose of green manuring is at the same time increasing the available plant food in the soil by dissolving the unavailable compounds. This is, we think, a brief outline of the theory that has guided Mr. Nelson's experiments, which may, perhaps, be said now to have passed the experimental stage and entered that of practical planting. It is to be hoped that other planters will follow the lead he has given them, and that one result may be progress in the direction of reduction of cost of production. This we must always regard as the best weapon for use in the struggle of competition.

INDIAN TEA FOR INDIA.

A Parsee Tea-merchant of Bombay has sent the *I. P. G.* an interesting paper on "Indian Tea for Natives of India." He says that the suggestion that tea manufactured by Europeans will never become a popular drink among the mass of Hindus, is entirely against his experience of nearly a quarter of a century. Indian tea, whether manufactured by Europeans or natives, can, he says, "be extensively introduced among the natives in every part of India in the manner it was done in the city of Bombay and many other parts of this Presidency." Besides, the Hindus are not the only natives of India: we have to take into consideration the vast Mohamedan population, who now-a-days make use of certain kinds of tea in place of coffee. The Parsee writer says:—"In the year 1874, when our firm was first started, Indian tea was hardly known in this city, and was never used among the natives, including the Parsees, who were nevertheless great China tea drinkers. But now the times are changed. Indian teas have superseded China teas with the exception of a small consumption for blending purposes. Not only high-caste Hindus, but even the working classes, such as mill hands and others, go in for Indian teas. There are now more than a 1,000 tea drinking shops in the city of Bombay alone, where Indian tea can be had at ¼ and ½ an anna per cup, and as many more where it is sold in packets and loose. And further, the natives are too well aware of the fact that, although the planters are mostly Europeans, the tea is manufactured by natives under their supervision." He considers that the chief reason why Indian tea is not extensively used by the natives all over India is that no systematic endeavours have yet been made to create a taste for Indian tea, and to show the advantage they will derive from the use of pure tea in preference to alcoholic drinks. He suggests that it should be introduced among the masses of the people, chiefly through the medium of native agency.

In addition to the Indian demand, there is also the Anglo-Indian and Eurasian, and we scarcely think anyone will

assert that this is either catered for or met as it should be. Packet tea in India is, in too many instances, irregular in quality and dear in price. It is beyond the reach of many of the poorer classes of Eurasians, among whom coffee continues to have the preference. South India has set a good example with its United Coffee Growers' Company for distributing tinned coffee. It might now follow up with a Tea blending and distribution Company, to select and blend South Indian teas, and distribute them in packet and in bulk. There is a hoary old advertising phrase:—"Ask for . . . . and see that you get it." In how many cases is the buyer outside India in a position to ask for South Indian tea and see that he gets it? As regards buyers in India, planters do not, for the most part, encourage them. Prices are asked that are quite out of proportion to current values in London, and it is perhaps scarcely an exaggeration to say that a Madras concern, such as Spencer & Co., Ld., for instance, could import its India teas from London at as low a cost as most planters quote for supplies deliverable at Madras. This sort of thing must in the long run tell against the producer.

THE GOVERNMENT GARDENS AND PARKS IN MYSORE.

The Annual Report on Government Gardens and Parks in Mysore for the year 1897-98 contains much that should interest planters, as well as a great deal that has no special interest for their community. Among the chief sections noticeable are those dealing with Agricultural pests and Hybrid coffee. The pests noted are not such as have been observed in coffee, but all pests should have an interest for our readers, seeing that the principles that guide the treatment of one class are often similar to those that relate to another. One pest was a caterpillar that was doing much damage to 'Gid Ragi' and other crops in the Hassan district. The India Museum authorities identified them as larvæ of the Noctues moth, *Heliothis armigera*, Hübn. the latter being identical with the dreaded 'Bollworm' of America. Various questions were put to raiyats, and warnings sent to them along with suggestions as to remedies. This is not a new pest. The second one noticed is the 'American blight' or 'Woolly aphis' of the apple, *Schizoneura lanigera*. Brown scale accompanied by a black fungus was prevalent on some trees during the dry season. The trees that suffered most from these mutual pests, are *Antidesema* sp., *Anthocephalus cadamba*, *Vitex altissima*, and *Psidium guyava*, but other trees and shrubs were affected also. This scale insect has been identified as *Dactylopius adonidum*, and is possibly farmed by ants for the secretion known as "honey dew". At any rate numerous ants (both black and red) accompany the insect and render the fungoid growth, which subsequently develops, less injurious than it otherwise would be. The fungus is possibly *Trisporium Gardneri*, Berk. Kerosine emulsion is the best remedy for these pests. It is also reported that the maiden-hair fern, *Adiantum cuneatum*, has been frequently attacked by a small insect which hides in the surface soil and gnaws off the tender fronds. Specimens were submitted to the Indian Museum for identification, when the following interesting letter was received from the Superintendent, Surgeon Major A. Alcock:—"With reference to your letter No. 360, dated 24th January 1898, the little animals are *Isopod crustaceans* of, I think, the genus *Porcellio*. They are allied to the "Wood-louse," (Slater) and "Sowbug" of English gardens. I do not know who could give you their specific name, or even that they have ever been named and described. I should think not, as I know of no systematic work whatsoever on the Isopods of India. I myself have been engaged for the last three years on Indian Crustacea, but it will be years before I get to the Isopods. It is difficult to suggest a remedy for the pests, that would not be equally destructive to the ferns. The conditions that suit the ferns best (namely, warmth, moisture, subdued light and plenty of decaying vegetable matter) are just those that best suit the "Sowbugs" and their relatives." Major Alcock adds:—"Centipedes flourish where "Sowbugs" do, and feed upon them; but I do not suppose any one would like to encourage centipides as a remedy."

Passing from the "General" section of the report to Cultivation and Experiment, we come to some interesting remarks on experiments with Hybrid coffee. Mr. Cameron opens by stating:—"The possession of hybrid plants on several estates in Southern India now appears to be an undisputed fact. These new forms are reported to combine, more or less, the characteristics of *Coffea Liberica* and *Coffea Arabica*, and are only found in localities where the two species have been cultivated and propagated together. They have not been introduced by the planters as new varieties, and were unknown prior to the introduction of the West African species *Coffea Liberica*. It is, therefore, reasonably inferred that these intermediate plants are true hybrids. The most remarkable thing about them is their immunity from coffee-leaf disease, a condition which can only be attributed to enhanced vitality in the constitution of the hybrid." Mr. Cameron then proceeds to state that this is a discovery of much importance to the planter, and will encourage him to pursue the operation of crossing on methodical lines, with a view to raising improved strains of seed, as has already been done in most of the chief products of agriculture and horticulture in Europe, and that what should be aimed at now is the systematic crossing and recrossing of different species and well marked varieties until a really good hybrid or cross is produced. With this object a small coffee-plot has been planted in the Lal Bagh. It consists of 135 bushes in two species and one variety, namely *Coffea Liberica* (Liberian), *Coffea Arabica* (Arabian), *Coffea Arabica* var. (Maragogipe). Most of the plants were of a good size when put down, and it is almost certain that a few of the Liberian and Maragogipe specimens will flower early next year, when crossing operations will be commenced. Mr. Cameron concludes by saying:—"On the occasion of the Planters' Conference at Bangalore last August, the writer had the honor of being invited to attend the discussion on 'scientific investigations,' when the opportunity was taken before the representative planters of Southern India to advocate the advantages of crossing and hybridising coffee with a view to invigorating growth and increasing productiveness. The same advice has been given in official correspondence with planters, and the institution is generally doing what it can to promote the welfare of the planting industry." Hybrids, or supposed hybrids, have been reported from the Oosoor and Ubban estates, Manjarabad; Koppa estate, Kadur District; Panera Peak and Kalpatti estates, S. Wynaad, and the Beechlands estate, S. Coorg.

OUR PRIZE ESSAYS.

The choice in respect to the five essays submitted in response to our offer of a prize of Rs.100 was easy enough until we arrived at the two essays dealing with the Wynaad district. Then it became difficult. We have finally selected as the prize-winner:

Mr. W. V. Hudleston's Essay

on

The Past, Present and Future Supply of Labour in the Wynaad.

For other than journalistic purposes we should have given the palm to "1874's" essay on the same subject, but having strongly urged the need for brevity, we feel that the very comprehensive paper that "1874" has sent us must be put aside in favor of its more compact rival. We hope to publish the Prize Essay next week; meanwhile we have remitted Rs.100 to Mr. W. V. Hudleston, of Kalpatty, South Wynaad.

A New Prize

of

Rupees one hundred

is now offered for the best essay on "The lines that a Madras Labour law should follow." The aim of writers should be to point out, *briefly* and *concisely*, the lines they think the Madras Government should follow in amending Act V. of 1866 in accordance with the resolution of the Government of India anent the report of the South of India Planters' Enquiry Committee.

The following are the rules of the competition:—

1. Write on one side of the paper only.
2. Give your name in full, and state address (not for publication, except in the case of the winner).
3. Be as brief and concise as possible.
4. Cite your authorities where possible.
5. Mark your MSS. "Prize Essay Competition."
6. Submit not later than 20th May, 1899 (in Madras).

It should be clearly noted that all essays sent in will be the absolute property of *Planting Opinion*, and that the proprietors will have the right to publish them, in full or abridged or revised, in *Planting Opinion* or elsewhere, and to republish in pamphlet or book form. No limit of length is fixed, but brevity is strongly urged. Rs.100 will be remitted to the winner immediately after publication of the prize essay.

THE "ROYAL EXPERIMENTAL TEA GARDENS OF INDIA."

"Secatur Indicus" suggests in the *Planter* that there should be some such gardens established as could properly bear the name given above. He puts forward a "purely financial" side of his scheme for discussion to begin with, remarking:—"working plans we can easily discuss subsequently." We do not propose to follow his year by year estimates through all their details. The first figures he gives are as follows:—

Capital Account.

	Rs.	A.
1,000 acres planted at per acre Rs 300	3,00,000	0
Buildings estimated	1,00,000	0
Machinery ,, ...	50,000	0
Furniture and fittings	20,000	0
Chemical laboratory	15,000	0
Library	10,000	0
Tools and stock	10,000	0
Microscopical laboratory	5,000	0
Total capital account ...	5,10,000	0

Annual Establishment Charges.

	Rs.	A.
The Director, at per month Rs.1,000	12,000	0
Chemist ,, ,, Rs.400	4,800	0
Doctor and entomologist, Rs.500	6,000	0
Engineer and surveyor, Rs.300	3,600	0
Secretary, Rs.300	3,600	0
Two estate managers, Rs 250 each	6,000	0
Storekeeper, Rs.100	1,200	0
Two clerks, Rs.50 each	1,200	0
Four overseers, Rs.15 each	720	0
Four tindals, Rs.10 each	480	0
Tea maker, Rs.250	3,000	0
Miscellaneous Establishment, calculated ...	2,400	0
Coolie labour, estimated	60,000	0
Total establishment charges ...	105,000	0

Among "miscellaneous charges" we find an item of Rs.5,000 for stationery, stamps and printing, which perhaps gives an indication of the scale of estimates generally. Disbursement accounts are then given for each year up to the thirteenth, and the closing remarks are as follows:—

It may be fairly held pending payment of interest it should be compounded, and following is the calculated amount that would fall due on the eighth year when interest regularly ensued:—

Compound interest account.

	Rs.	A.
On first year's establishment loan, eight years' compound interest	2,100	0
On Second year's establishment loan, seven years' compound interest	1,837	8
On third year's establishment loan, six years' compound interest	1,775	0
On stationary loan calculated six years' compound interest	262	8
On tea charges loan of third year	61	4
On capital eight years	10,200	0
Total compound interest account	16,236	4
Balance in hand	96,225	0
Less Compound interest	16,236	4
Nett credit balance	79,998	12

One invaluable item has, however, been omitted from the estimate, namely, Rs.5,000 per annum for chemical substances. Manure and purely experimental work accordingly I set it down Rs.5,000 for the past 13 years, Rs.65,000.

Balance carried to next account Rs.14,998-12.

We hesitate to comment on this beyond remarking that while Rs.5,000 is religiously set down for stationery every year, Rs.5,000 per annum for 13 years, for artificial manures and experimental work is thrown in at the last minute as an after-thought, and the "interest compounded" thereon is not even hinted at. Certainly, "any discussion" that ensues will be interesting.

INDIAN TEA IN FOREIGN MARKETS.

The undernoted excerpts from Messrs. Baines & Co's. (Calcutta) Tea review, dated 9th instant, are very instructive, especially if we bear in mind that the term "Indian Tea" does *not* in this case include South Indian tea; or, at any rate, that the quantity of South Indian leaf exported to foreign markets is so infinitesimally small as to be unworthy of special comment. Messrs. Baines say:—

Australia.

Our trade with this country has been somewhat disappointing showing as it does no increase on last year, while Ceylon has exported 15,126,891lbs. against 13,258,456lbs. in 1897. No doubt the superior freight facilities which Ceylon enjoys has something to do with this, there being four or five lines calling weekly at Colombo, while we can only boast of one steamer a *month*! Besides

the freight question, many gardens, notably Darjeeling, have preferred to sell in London, in spite of the growing enquiry for flavoury kinds in this market. During the past season many orders could not be executed for want of supplies, at a time when Darjeeling Pekoe Souchongs were obtainable in London at 5¾d. and 6d.

America

Has shown a growing appreciation of our teas, and one of the largest wholesale houses in London is pushing the trade there with great effect, and the grower should avail himself of the orders which are sent to this market, and not be only dependent upon the export from London

Asia

Has shown the biggest increase in consumption of any outside market, which has been gratefully welcome to those Cachar and Sylhet growers who have sold in Calcutta, for the bulk of this export has been Pekoes from these districts, with which throughout the season the London market was fully stocked, and which were plentifully obtainable at 5¼d. to 6d. there, against 5-6 to 6-6 annas in Calcutta.

The class of Pekoe in favour in the Asian trade is a well-twisted, black, even leaf, with fair tip, free from broken and small, and all Cachar and Sylhet gardens should carefully note this.

Well-made strong chests, *not half chests*, are required as the teas have long transport on camel, which none but the strongest boxes will bear.

Foreign Europe.

Orders continue to increase steadily from Germany, Constantinople, and other European markets, and there is a growing preference in those centres to obtain their supplies from the country of growth. With regular lines running direct, buyers are saved time and freight by operating in this market, a fact not to be lost sight of by the producer.

Of course, in the matter of freights, South India is at a great disadvantage, while Ceylon has the pull over both Northern and Southern India. We cannot but think, however, that the time has arrived when Nilgiri and Travancore Teas should be specially pushed in those foreign markets for which they are suitable. Whether it would pay South Indian tea planters to manufacture tea specially for, say, the American market is a matter for further consideration. It is a sound general principle, however, that one should have a reserve string, whether for a bow or a banjo. To rely entirely on London demand is shortsighted policy.

NOTES.

Mexican Coffee. Exports of coffee from Mexico in 1897-98 amounted to about 354,300 cwt.—nearly all the crop.

Low-grown Tea. At the forthcoming Agri-hoticultural Show to be held at Colombo on the 21st and 22nd July, a special gold medal will be given for tea grown below 1,500 feet.

Our "Plebiscite." We have to hold back until next issue remarks on the results of our reference to subscribers as to what subjects they would wish *Planting Opinion* to deal with.

Coffee, &c., in Coorg. During the official year ending 31st March 1898, there were 86,155 acres under coffee in Coorg, and 8 acres under Cinchona. The exports of coffee totalled a value of Rs.19,69,600. About one-third of the land revenue of the district is derived from coffee.

The Chemistry of Mate Tea. The *British and Colonial Druggist* says:—Polenske and Busse have examined a number of commercial samples of this tea, and find that the percentage of caffeine varies from ·5 to ·88 per cent. Of great interest is the discovery that small quantities of vanillin are almost always present. This substance has never, we believe, been found in any of the caffeine-containing plants before.

Wild Vanilla in Zanzibar. The *Shambas* reports that vanilla-plants grow wild out there in large quantities, but the plants are weak and straggling. Fruit was forming on many of the plants. Some insect must have been at work fertilising the flowers, and if the wild why not the cultivated? asks our contemporary.

The United State's Tea Market. Mr. Blechynden's "1898" report is published to-day, and will well repay perusal. Hopes and fears alternate in a somewhat bewildering manner, but we take it that if India and Ceylon prosecute energetically the work they have begun they stand a very fair chance of tenfold success on success.

The drowsy South. The United States and Canada took last year 13,608,696 lbs. of British-grown tea, against 11,361,840 lbs. in 1897. The quantity has steadily increased from 3,075,900 lbs. in 1892. Of the total quantity, vast India exported only 5,971,701 lbs. and little Ceylon 7,636,995 lbs. As regards *South* India, we very much doubt if it totalled up 200,000 lbs.!

The Rubber Forests of the Congo. An important order has been signed by King Leopold of Belgium, whereby a certain number of trees or caoutchouc-bearing lianas are to be planted each year in all the forests of the Congostote State. A new forestry staff of one inspector, six controllers, and six sub-controllers is to be organised for the purpose of seeing that the new order is fully enforced.

A new Planter's Association in Ceylon. At a meeting held at Galle on 18th instant, it was resolved to establish an Association called the "Galle Districts Planters' Association," and that all proprietors and representatives of estates in the Southern Province wishing to join be eligible for membership. Mr. C. G. Simmonds was elected Chairman, Mr. C G. d'Hauteville, Secretary.

The London Tea Market. Cabling to Colombo on the 17th instant, Messrs. Gow, Wilson and Stanton reported that the market for Ceylon tea was

generally unchanged, but the average showed a fall of ¼*d.* standing as 8½*d.* Reuter still gave it as 8¾*d.* and stated th t 25,000 packages had been sold out of 26,000 offered. Of 33,000 packages Indian offered 30,000 were sold, the average continuing unchanged at 9¼*d.*

Coffee in Canada. We alluded recently to the practical absence of demand for coffee in Canada. This week's mail has brought us papers in which an advertisement attributes the fact that "the consumption of coffee in Canada is not what it should be" to the fact that "the public is imposed upon by inferior coffee and compounds." The United Coffee Growers Company may find Canada a useful market.

The Tea Duty in Austria-Hungary. The Vienna Chamber of Commerce lately passed a resolution :—"That the duty on tea be reduced to 50 kreutzers per kilogramme without any regard to quality or country of production, the differential tariff in favour of all sea-borne teas remaining the same."

Mr. Cameron's Visit to Coorg. In a generally appreciative review of Mr. John Comeron's report of his visit to Coorg, the *Madras Mail* criticises two points, remarking (1) that Mr. Cameron does not show *why* he has arrived at the conclusion that the Coorg coffee industry has "entered the forcing stage," and (2) that though one object of his visit was to conduct certain experiments, there is no allusion in the report to any experiment whatever.

Coffee in Zanzibar. A recent report says :—"About 60 young Arabica coffee trees are growing in the Nursery from seed obtained from Nyassaland. They look well and will be planted out, though they can hardly be expected to prosper in Zanzibar as the elevation is too low. Liberian coffee was sown late in the year and has not yet germinated. Attempts have been made to procure seed of the Maragogipe coffee, Brazilian variety, but none has yet been received."

Natal Tea. Mr. J. Austen, of Messrs. Tarrant, Henderson & Co., Colombo, has returned from a trip to Mauritius. South Africa and the Transvaal. He considers Natal tea poor stuff, and says that the bulk of that grown in the colony compares unfavourably with Ceylon. The sale of Natal tea is considerably assisted by the fact that both in Cape Colony and the Transvaal there is no duty imposed, whereas outside teas are taxed to the extent of 6d. per lb., and, of course, that is a heavy handicap on Ceylon.

Brazilian Coffee. In the course of a long letter, dated Rio de Janeiro, 14th January 1899, to the *Ceylon Observer*, Mr. A. Scott Blacklaw remarks :—"Coffee No. 7—the Brazilian middling type—is 6⅞ cts. per lb. in New York; and, I write it with the sentiment of one revealing a secret, the arrivals of coffee at the sea port towns are not diminishing in quantity, nor the stocks in consuming countries are not getting smaller. The weather is all that the incoming crop is in need of—occasional hot days with evening thunder showers."

Tea for Thibet. The *I. P. G.* remarks that there is a peculiar fact about Chinese brick tea in Thibet which would tell severely against the introduction of Indian tea. The Chinese bricks circulate as a sort of money, like Indian currency notes. The Chinese descriptive wrappers form a kind of face-value stamp. With gentle irony our playful contemporary enquires :—Even if it were possible, would it be justifiable to introduce confusion into the Thibetan monetary system and bless them with a "currency question ?"

Eighty years ago and now. The following table gives a comparison of approximate prices in England in 1819 and 1899 :—

Tobacco, per lb.	6*s.*	5*s.*
Tea. in canister, per lb. ...	7*s.* 4*d.*	1*s.* 8*d.*
Sugar, moist ,, ...	10*d.*	1½*d.*
,, lump ,, ...	1/1*d.*	2*d.*
Cheese ,, ..	10½*d.*	8*d.*
Salt ,,	5½*d.*	1½*d.*
Candles ,, ..	11*d.*	4*d.*
Soap, yellow, per cwt. ...	11 6*d.*	2/6*d.*

The figures point their own moral.

The Canadian Market. In a letter to the *Canadian Grocer* anent increasing imports of Japan tea, the 'Salada' Tea Co. state that much of this tea passes through Canada to the United States and is never intended for Canadian consumption, and that practically every wholesale and retail dealer and every commercial traveller knows that the consumption of Japan tea is quickly falling off in Canada, and that of Ceylon and Indian tea is fast increasing. There is no bonded warehouse system in the States, so many American importers use Canada as their bonded warehouse.

Uncle Sam buys Tea in Canada. The *Canadian Grocer* of 17th ultimo reports :—Buyers from the United States have been on the Toronto market during the past week in search of China green teas, and they are understood to have secured about 600 half chests. This has helped to appreciate the value of these teas in the "Queen City," and descriptions which were, three weeks ago, selling at 11 to 12c., are now firm at 13 to 14c. per pound. China green teas are decidedly scarce in the United States, and shipments to the North American continent, this season, are only 12,000,000 pounds, compared with 20,000,000 pounds last season.

Mr. R. Blechynden. *Apropos* of the report published on another page, we note that the London correspondent of the *Times of Ceylon*, remarks :—"I presume it is now known in Ceylon that Mr. Blechynden's agreement, which concludes in April, is not to be renewed as far as America is concerned. The Indian Tea Association have decided that the work is done, that the introduction of Indian Teas into the States may now be left in the hands of those who have been induced by past efforts to handle the teas; and the money thus saved to be used for pioneering other countries—Russia and France in particular. Seven years Mr. Blechynden has been working in the West.

Colouring and Coating Coffee in Belgium.

It has been officially notified that article 3 of the Belgian royal decree of September 28, 1891, relative to the traffic in coffee, has been completed as follows:—

Will be tolerated, the total coloration of coffee by aid of inoffensive matter, as well as the coating of coffee with alimentary fatty matter or with sugar, only on condition that the proportion of foreign substance added shall not exceed 1 per cent. of the total weight of the coffee.

Coffee prepared with inoffensive matter other than coloring, alimentary fatty matter, and sugar, as, for example, gum, lac, may be sold, exposed for sale, held, or transported for sale or delivery when bearing a label indicating in plain characters the nature of the added substance, as per example, *café laqué* (coffee gum lac).

Coating with hydrocarbides (vaseline, paraffin, etc.) is declared injurious to health, and is consequently prohibited.

A "Tree of Gold."

Indian Gardening says:—A Rangoon paper tells the story of a young banyan tree of only three years growth that has sprung up in Burma and which "has the appearance of being made of pure gold." Making allowance for exaggerations, it would be possible, perhaps, for botanists to name the particular species of tree that might be so described. The field in which the tree grows is near the Kodok "pick-up" station between the railway stations of Phyinbongyi and Poundaw, on the Sttang section of the Burma railway, and the owner of the field is a Karen, who lives near the spot; and who has had many thousands of excited visitors to see his wonderful tree, during the last few weeks. The Rangoon Paper goes on to relate that all sorts of superstitious beliefs have sprung up amongst the Burmans in the neighbourhood.

Downcast Ooty.

"Flora" writes from Coonoor to *Indian Gardening*:—"Ootacamund is most depressing in many ways. The planters and gardeners are all so downcast, that they don't seem to be able to make anything out of their efforts. Coffee is not what it used to be. Tea pays pretty well, but the man who goes in for fruit culture is a fool for his pains. There is no sale absolutely for anything, save at such low rates that it actually does not pay carriage; and when you add to that the inroads of vermin, thieves, and 'Acts of God,' as they say, when a hail storm batters your trees, or a drought lays them low), you may imagine what the outlook is. A Kotaghiri planter who has grown fruit for years now, says it is the most profitless undertaking 'He prefers to let his oranges rot under the trees rather than sell. The coolies and birds and beasts get their share.'" Surely that Kotagiri planter cannot expect his fruit to "sell itself." If there is no market at his very gate, he should try to find one.

Advertising in Canada.

Whoever is conducting the India-Ceylon Tea Campaign in Canada has a happy knack of drafting advertisements. One sets out "a little problem for calculating grocers." The growth of demand for Ceylon and Indian tea is contrasted in figures with the decay of demand for Japan and China leaf, and the problem follows in these terms:—"*Problem*: Take the average of the above years as the normal consumption of tea in North America; deduce from the statistics given the number of years from 1898 within which the positions of Machine-made, and Hand-rolled tea will be reserved. The name of those successfully solving this problem will be published on this page. A second advertisement gives a picture of "A group of Singalese tea pickers at ease" and the accompanying letter-press says:—"Every possible care is taken in the cultivation, in the picking, and in the preparing and the packing of *Ceylon and Indian Teas* for the market. This is one reason why they are so pure, cleanly, appetizing and healthful. Thousands of dollars are being spent to thoroughly advertise them throughout the country. Grocers should try and reap their share of the benefit."

Say Coffee about 3¾*d.* to 15½ per lb. or 35*s.* to 144/8*d.* per cwt. (*no* Indian) ; and Tea (bar siftings) 6*d.* to 2/6*d.* per lb. (*no* South Indian.)

Adulterated Coffee.

We note that it has been suggested at Home that there should be *uniformity* throughout all the United Kingdom in regard to the quantity of chicory used in a mixture of coffee. It is scarcely likely, however, that any such suggestion will be seriously considered. By far the simplest plan would be to make "mixers" label their compound '. . . . per cent. coffee, ... per cent chicory,' or, at the very least :—' this mixture contains, in addition to chicory, at least . . . . per cent. of pure coffee. The Bill in regard to the Sale of Food and Drugs that has been introduced into the House of Commons by Mr. Long, the Solicitor-General, and Mr. T. W. Russell, deals mainly with agricultural products. There is, however, a part devoted to foods and drugs in general. Section 12 of the Bill is perhaps the most likely to interest coffee-planters, as it deals with the labels for notifying that the substance sold is a mixture, and so far amends the Section 8 of the Act of 1875. that a label shall not be deemed to be legibly printed within the meaning of the section unless it is so printed that the notice of mixture given on the label is not obscured. We need scarcely remark that any such provision as this is ridiculously inadequate to the requirements of honest trade.

"Cheesy" Teas.

Alluding to these, Messrs. Whitworth, Hillyard and Wade, of London, write :—"In many instances the objectionable flavour of these teas passes away on exposure to the air, but the tea is prejudiced at the start by the short-sighted policy of the growers in not seeing to it that the wood is thoroughly dry and inodorous. It is surprising that the managers of the various gardens are not more jealous of the reputation of their respective marks. Wholesale firms ought not to be thus placed under the grievous necessity of warning their customers, who buy direct from bond, to be on the alert for a defective package of this character in a consignment of Indian and Ceylon teas for their own blending, for after all the great majority of the larger country wholesale and retail buyers prefer to blend their own teas, each retaining his own special characteristics in preference to those of the universal blender, who will supply the same blend to his competitor—or even to his customer. Many a teadealer has turned his back upon a mark which was once a favourite with him, and for no other cause than the "cheesy" character of one or two lots." A Darlington grocer pertinently remarks :—"It would be of service to the trade if some solicitous for others' welfare would tell us what becomes of the many hundred packages rejected by experts. Do the merchants take the tea back, or do they put these remnants on the market and sell them as damaged packages ?"

LETTERS TO THE EDITOR.

E. LITHOSPERMA.

Dear Sir,—In Mr. Cameron's interesting article in *P. O.* of the 18th instant, in referring to *E. lithosperma*, he writes as follows :—"The evergreen species, *E. lithosperma*, is also under trial, although in some cases it is not true to name, being thorny and a doubtful evergreen." In writing this he has fallen into the not uncommon error of assuming that the thorny trees are not *E. lithosperma*. He is slightly in error in writing as he does, as the true *E. lithosperma* is a thorny tree, the thornless one being a type evolved by cultivation. In common with all cultivated types it displays a tendency to reversion to the parent stock when grown under altered circumstances. This reversion is more pronounced under extremes of dry, heat and cold, the percentage of thorny plants grown under similar conditions of climate and altitude as the parent trees being nominal. I have observed trees that were completely thornless occasionally throw up thorny shoots on being cut down, the thorns ultimately disappearing as the tree recovers from the shock. I should not have troubled you with this explanation only

that Mr. Cameron's remarks may lead some planters to think that the occasional thorny plants that occur in nurseries from Arienkow seed are not the true *E. lithosperma*. *They are only too true.* That they are the perfectly true type anybody can ascertain for themselves by letting a thorny plant go to seed, the seed pods will be the unmistakable pods of *E. lithosperma*, totally different from the pods of the thorny *E. Indica* and fully justifying the name by which the tree is known in Java, *E. Hypapahoros*, the lower half of the pods being barren, being, I believe, totally distinct from any Erythrina known. That the tree goes very thin in the dry weather is perfectly true, and is probably the reason the tree is so appreciated in Java, the automatic conversion of the shade overhead into a mulch on the ground in the hot weather being eminently favourable to retention of vigour in the tree, and maturing the wood, and development of blossom.

B. Nelson.

NOTES ON BUILDING WANTED.

Sir,—A column in each, or every other, issue of *P. O.* devoted to notes on building generally, but more especially as relating to coffee and tea estates, would, I am sure, be of interest to many of your readers, more especially to those who like myself have very little experience in such matters.

Rough plans or sketches might be annexed for explanatory purposes.

Beginner.

GENERAL ARTICLES.

THE COLOMBO TEA SALES.

Impressions of a Visitor.

The first thing that strikes one on entering the Colombo Sales' Room at the Chamber of Commerce is the comparative quiet with which the proceedings are conducted; the room is airy, well ventilated and cool, with Japanese punkahs in full swing, and there is no crowding. Bidders sometimes speak in an undertone, but their voices are instantly spotted, and swept up into the continuous flow of the sellers' auctioneering harangue. To any one accustomed to the Tea Sales at Mincing Lane there is, of course, something lacking in the excitement of the proceedings. Of the latter I attended two at home, not long ago, the second time with Mr. Wm. Somerville himself, who also kindly accompanied me on this my first visit to the Colombo Sales Room, and by running over the names of those present, greatly added to one's enlightenment on the *personel* engaged in capturing the various breaks and grades that were put up and bid for with eagerness, deliberation, or sometimes distinct indifference. At Mincing Lane men stand in a throng round the auctioneer's desk, the biggest buyers nearest, every desk in the room being crammed—the majority of the company it is true being lads who have come to take down the prices for the papers or for firms other than those represented in the room. There the London auctioneer's task is vastly more trying and to pick out the first voice among six that are roaring together like a hurricane is no simple matter. Here in Colombo too there is more time for conversational remarks, quite a little spar being raised now and again over some abnormal bid or point of sale with which a bidding-claimant happens to be dissatisfied. Of course, at some the interests concerned and the consignments dealt with are vastly more immense, so it is scarcely to be wondered at that the business proceeds with far more continuous briskness. However, under the conductorship of Mr. W E. Drury of Messrs Forbes and Walker this contrast was not so marked, and the largest of the three sales lists was tackled with the greatest despatch. One of the largest,—if not, the largest—prices among those in to-day's sale was that fetched by *Palmerston* Broker Orange Pekoe— namely 79 cents; 77 cents was given for the same grade of tea from *Petteresso*, while *Queensland* (another of the Palmerston Co.) fetched 76. *Inverness* broken Pekoe was offered at 65 but not sold, 60 being the nearest bid. In Mr. E. John's list 76 cents were given for *Mount Everest* B. P. and 63 for its Orange. *St. John's* B.O.P. was started at 70 and knocked down at 77; for Orange Pekoe of the same estate the price given was 66, for Pekoe 51, and 45 for Pekoe Fannings. In Somerville & Co.'s list *Dalhousie* O. P. fetched 55 *X. Y. Z.* broken Pekoe 54, and *Woodthorpe* (ditto) 51. These were the chief prices among the larger breaks.

Most of the bids were made and won by Mr. F. F. Street, who seemed always ready to step into the breach when bidding flagged, or to meet a piteous appeal from the desk, such as: "What only—— cents? Oh, I can't sell. I'll take——(perhaps one cent higher)." Mr. Garrett was there buying for Lipton, but his bids were by no means over frequent. Mr. Croll for Messrs. Crosfield, Lampard & Co. bid very little on the whole, but generally destroyed the competition with a bold and well-timed offer whenever there seemed a certain hesitancy in the room to advance as far as the shadowy boundary lines of market value. As far as I could learn, the market was, if anything, rather better than usual, one bidder averaging something like a 2 cents rise on that of last week. To turn to the lighter side of the proceedings, the following will give a selection of the remarks that passed aloud, here and there:—

At one point a break of 2,340 lb. in the catalogue was announced to be only 270 lb. "Why don't you correct the catalogue?" called one. "I'll send it to you to correct next week!" returned Mr. Drury. "All in Venesta packages!" said the auctioneer, in putting up some B. P. fannings of Kennington for sale. Later on the question whether they were packed in Venestas was considered so important that Mr. Drury was requested to send a clerk to telephone an enquiry as to the chests used. The tea was Nahalma Broken Pekoe. "I'll give you 45 cents if they're not in Venestas" was one exclamation. A finish-up bid of 41 cents for Clunes' Pekoe made the room musical, or the reverse,—for several notes were blended in a discordant whistle. For *O.S.S.* an offer of 40 cents being unsuccessful, a non-bidder called across "Don't sell without seeing me." Over Lamiliere teas business was proceeding so rapidly that several were unaware exactly which lot was being dealt with. "Where are you now?" called one. "Pekoe!" was the reply. "What did you do with the Pekoe Souchong?"—"You bought it—at 42 cents!" was the crushing rejoinder. When things were going to sleep a little, and someone, missing a bid he thought was his, gave vent to his feelings a little, he fetched a sharp retort from the person reflected on. "Oh! O!" said a few. "Well, I won't stand *that* from anybody" the injured one replied: "No don't" went the chorus. "Knock him down. Sit on him. Jump on his chest!" and so on *ad lib.*

Even to an outsider the Colombo Tea Sales are far from dull. —*Ceylon Observer.*

NOTES ON TEA.

The following extracts are from Messrs. Baines & Co.'s (Calcutta) review of Tea in 1898:—

Assortment.—There is plenty of room for greater attention to this part of the manufacturing process, and the fewer the qualities made the better; for a garden producing fair medium teas, four qualities are quite sufficient; this specially applies to small gardens, whose managers should try to cut down as much as possible the number of grades in their assortment; it is better to have two full-sized breaks of Pekoe and Pekoe Souchong, than four or five qualities in small breaks. Where small breaks are unavoidable, it would pay to pack and keep them until a sufficient amount of tea is manufactured, then bulk the whole.

Good appearance in make should be aimed at, as America and Asia select teas of this description,—large, rough, bold leaf should be avoided; if this class of leaf is being taken from the bushes, owing to quick growth and the flush getting out of hand, it is better to have it equalized in the breaker, thereby saving the wholesale houses and blenders the trouble of cutting it for themselves; a well equalized leafy Broken Pekoe Souchong, or small Pekoe Souchong, free from dusty broken, sells much better, and is a far more useful tea than a bold leaf.

Invoices should comprise breaks of not less than 20 full chests, 30 half-chests or 50 boxes, which are the minimum breaks sampled by the trade, and it is as well to have a few extra chests in the

event of damage, reducing the size of the break, for in these days, when the weekly auctions of Indian tea frequently amount to 50,000 packages, small breaks meet with very little attention, and are sold on a separate day, when large buyers scarcely think it worth while to attend the sale.

Our advice to growers therefore must be to pay the closest attention to improvement of quality, and to avoid sending forward any produce which, from inferiority of quality, or undesirable packing, will damage the reputation of the article. There is no doubt that careful supervision on these matters will bear fruit in due course.

Equality in tares, and well-made packages, are matters which should have the attention of every manager.

The consumer attaches great importance to getting his teas in well-made strong boxes, and although there has been great improvement in recent years, there are still many gardens from which teas are sent down in weak chests, made of bad wood, causing loss in weight, and consequent claims. Where a garden once gets a name for bad packages, buyers will fight shy of the mark in the future. This year badly seasoned wood has resulted in frequent cases of "cheesy" taint upon Cachar and Sylhet invoices, losing to the grower often 1d. per pound in value.

The weight of tea in chest should not exceed 100lbs. to 110lbs. of broken leaf and 80lbs. to 90lbs. whole leaf, while Dusts should never exceed 100lbs. nett, in order to avoid loss in weight.

Prospects.—With the extensions of 1896-98 shortly coming into full bearing, there is no probability of short supplies, nor are prices likely to show any great rise from the level they have reached in the past three years, nevertheless the industry is in a healthy condition, and consumption is growing, and there is no reason, with careful attention to manufacture and expenditure, why the tea trade in India should not continue on a safe remunerative basis.

TEA, &c., COMPANIES.

Atal Tea Co., Limited.—Shows a profit of Rs. 16,578-7-8 for 1898. A dividend of 5 per cent. is recommended.

The total outturn from the gardens of the company weighed out 309,605lbs. which has sold at an average of 5 annas 5 pies.

Durrung Tea Co., Limited.—The crop amounted to 2,750 mds as against 2,682 mds. in 1897 or some 50 mds in excess of the estimate. The quality of the tea has been satisfactory throughout the season, and the average annas 6-11 per lb. obtained is fair in a season like the one just closed, when the market ruled unusually low. There has been a good labour force on the gardens, which has enabled the manager to cultivate, well. Sulphur has again been applied with success and the bushes have been kept fairly free of blight. The result of the season is a small profit of Rs. 16-10-11, and the balance at profit and loss is Rs.433-0-6, including Rs.416-5-7 brought forward from the previous season.

Hoolungore Tea Co., Limited.—After writing off a deficit on the season's working of Rs 5,141-6-7, accounts shew a balance at credit of profit and loss account of Rs.7,474-5-11 to be carried forward. The crop was only 2,557 maunds, 34lbs., against an estimate of 2,900 maunds, and an outturn in 1897 of 2,769 maunds 78lbs. The average price was 8 annas 5 pies per lb against 9 annas 1 pie in 1897. Fifty-two acres of new tea were put out during the year, which brings the planted area up to 943·89 acres.

Mothola Co., Limited.—Accounts show profit of Rs.21,454-9-5, and a dividend of 7 per cent is recommended.

The crop weighed out 2,377 mds. against in 1897, 2,456 mds. and against in 1896 2,679 mds. The whole of the crop was sold in Calcutta, yielding a gross average price of As. 8-10 $\frac{13}{16}$ per lb., and a nett average of As. 8-9 $\frac{3}{16}$ per lb., the corresponding figures for last year being As. 8-11$\frac{7}{16}$ and As. 8-9$\frac{7}{8}$ per lb.

Dehing Co., Limited.—Profits Rs. 12,614-11-11. Crop 7,031 maunds against 6,314 in 1897. The entire crop was sold in Calcutta, and has realised a gross average price of annas 8-3 per lb. against annas 9 1¼ per lb last year.

The Gangawatte Estates Company of Ceylon, Limited.—The Second Annual General Meeting of this Company took place on 17th instant at Colombo, Mr. T. G. Hayes (Director) presided. The report stated:—Acreage.—Tea in full bearing, 335 acres. Tea planted in 1898, 10 acres. Grass and ravines, 10 acres. Total, 355 acres.

There was a shortfall on the estimated crop of tea, no unusual circumstance this year. The crop from the Gangawatte division was sold in green leaf, and that from Bitterne was manufactured partly at Rickarton Factory and partly at Gangawatte, which work commenced in July last.

The Bitterne crop analyses as follows:—41,348 lbs. made at Rickarton, and sold in London at the equivalent of 36·6 cts. net. 23,605 lbs. made at Gangawatte and sold in Colombo averaged 38 55 cts. net. Computing the outturn of Gangawatte leaf at the same rate as that given by Bitterne, the total crop amounted to 141,445 lbs tea against an estimate of 150,000 lbs., which realized R55,598·55, or an average of cts. 39·58 per lb. The profit on the season's working amounts to R19,204·65, subject to miscellaneous expenses, interest on mortgage, Secretariat and Auditor's fees. Out of the available balance an interim dividend of 5 per cent on the capital has been paid, absorbing R8,925; and the Directors now recommend the payment of a final dividend of 3 per cent., leaving a balance of R1,715·91, which, after meeting Directors' fees, they propose should be carried forward to the new year. The estimate of crop for 1899 is 150,000 lbs. against an expenditure of R38,992.

The Union Estates Company of Ceylon, Limited.—The Annual General Meeting of the above Company was held at Colombo on 18th instant. The Chair was taken by Mr. W. D. Gibbon.

The Annual Report stated:

Hayes Group—tea in full bearing, 517; tea not in bearing, 11; cardamoms 25; total cultivated, 553; grass, jungle and waste land, 1,658; total 2,211. Dea Ella—tea in full bearing, 235; tea not in bearing, 13; cocoa, 91; total cultivated, 339; grass, jungle and waste land, 147; total 486.

The tea crop amounted to 308,025 lbs against an estimate of 360,000 lbs., for which the average nett price realised was 34·32 cents per lb. compared with 32·64 cents in 1897, or an increase of over 1½ cents per lb.; 149 cwts. cocoa were sold at an average of R41 per cwt., and there were small receipts by sale of cardamoms. The shortfall in the crops must be attributed to the very dry season.

The estimated crops for the current season are 327,000 lbs. tea, 150 cwts. cocoa, and 300 lbs. cardamoms on an expenditure on working account of R97,441·11. In addition a small profit is anticipated from purchase of outside leaf and from manufacturing teas for other estates. On capital account R7,356 is estimated for completion of machinery on Hayes and the upkeep of the new clearings on both places.

The Estates Company of Uva, Limited.—A Meeting of the Estates Company of Uva was held in Colombo, on the 18th instant. Mr. W. D. Gibbon presided. The report stated:—

Acreage: Dammeria Group.—Tea in full bearing, 46 acres; in partial bearing, 110 acres; not in bearing, 27 acres. Total tea, 602 acres; other products, 30 acres; timber, grass, forest and waste land, 558 acres. Total 1,190 acres. Battawatte and Forest Hill.—Tea in full bearing, 413 acres; in partial bearing, 140 acres; not in bearing, 38 acres. Total tea, 591 acres; other products, 5 acres; timber, grass, forest and waste land, 159 acres. Total 765 acres. Gampaha.—Tea in full bearing, 332 acres; in partial bearing, 124 acres; not in bearing, 119 acres. Total tea, 575 acres; other products, 45 acres; timber, grass, forest and waste land, 246 acres. Total 866 acres. Total tea in full bearing, 1,210 acres; total in partial bearing, 374 acres; total not in bearing, 184 acres. Total tea 1,768 acres; total other products, 80 acres; total timber, grass, forest and waste land, 963 acres. Total 2,811 acres. The tea crop, which was estimated at 505,000 lbs., only amounted to 485,712 lbs., the shortfall being altogether attributable to the unfavourable weather experienced during the last few months of the year. The coffee crop however amounted to 462 bushels, as against estimate of 120 bushels, while there were also crops of 89 cwts. cocoa, 553 lbs. cardamoms, and 56,632 lbs. cinchona bark, which latter was harvested from trees cut down to improve the growth of the tea planted underneath. During the year, 60,658 lbs. tea were manufactured for other estates. The average nett price realised for the tea sold was 39½ cents, as against an average of 41 cents last year.

The Directors recommend the payment of a dividend of 2 per cent. for the year, and that the balance of R9,842·10 be carried forward to the current year's accounts. The crops for the current year are estimated at 540,000 lbs. tea, 210 bushels coffee 600 lbs. Cardamoms and 65 cwts. Cocoa, on expenditure of R174,483 on the estate, while a small profit is anticipated from manufacture of 60,000 lbs. tea for another estate.

"RUST" FUNGUS ON TEA.

Mr. J. B. Carruthers, the Ceylon cryptogamist, shortly before he returned to England, paid a brief visit to a low-country estate to report on a form of leaf-disease on the tea plants which had been noticed there for three years. His examination was not thorough, but he has prepared the following report:—

As requested, I visited estate and examined the tea plants which were diseased. The Superintendent has observed the same phenomenon for about three years past. An area of about 40 acres contained affected bushes, but about one plant in five was the most observed on any given square ten yards. In no case had the disease killed any plants, and always disappeared after pruning. I took specimens of the leaves, and these I have examined microscopically. There is just a "rust," *i.e.*, a fungus belonging to the *Uredineæ* a group to which the *Hemilea vastatrix* of coffee and the rust of the wheat belong. This fungus can be recognized on the tea leaf by its fruit, which appear to the naked eye as a reddish-brown mould, covering a space varying from the size of a pin's head to that of a threepenny piece. With an ordinary field lens this shows itself to consist of a number of thread-like stalks, swollen at the top, and bearing on the swollen portion a series (5 or more) of orange-coloured spores (*Basibiospores.*) These spores in all probability (that is judging by what is known of the life-history of allied fungi) will on falling on to another tea leaf, or another portion of the same leaf, produce another spot of rust. There is also another fungus which produces a yellow or brown patch, and this is covered in some cases by a series of minute black dots, which are lighter when older. These small spheres contain ascospores—which places this fungus in the large group, characterised by such spores, the ascomyates, to which the cocoa canker belongs. That these are the only spores on the tea leaves, or that they are alone responsible for every diseased bush, I am not willing, after so cursory an examination, to state, but a careful search revealed no other spores produced on the leaves. Both these fungi live in the leaf, and, as they do not re-appear in the plant after pruning, it is evident that they are confined to the leaf, and therefore, if the leaves are taken off and burnt, the spores will be destroyed. From the fact that the young leaves plucked for tea-making are not rusted, even on affected bushes, I should imagine that the time taking for the spores to reproduce themselves is more then ten days. The mycelium of roots of these fungi ramifies among the loose cells of the leaf, and gains it nutrition from the juices of the plant. A greater strain, therefore, is put upon the plant in supplying food, both for itself and the fungus. There was no case in the fields I examined of a bush being so badly attacked as to cause death. A purely leaf-disease very rarely produces fatal effects. If measures are taken to prevent the spores of these diseases spreading, by burning diseased leaves, there is no reason to expect that they will spread to any serious extent. A cooly, or gang of coolies, might be specially employed to collect and burn affected leaves. It has occurred to me that any tea being left to go out of cultivation might easily foster these or other diseases; and it would be well that at any rate an inspection of such untended tea should be made to ensure that it is not a "spore farm" for the rest of the island. As the report has been written after a most hasty examination, I must ask to be allowed to state that I consider the statements it contains open to correction.

(Signed) J. B. Carruthers.

October 14th, 1898.

TEA WITHERING.

The Planter remarks:—A correspondent, who says he has had no personal experience in the manufacture of tea, makes some suggestive remarks. He writes:—I have had many conversations during my tours with some of the most experienced tea makers, and have always been impressed with what I learnt from them as to the need for some improvement in the ordinary system adopted in the initial and important process of "withering." It appears to me, in short, that the style of "wither" should be more in keeping with original method of the Chinese. Tea making is agreed to comprise chemical and mechanical processes, and though no one suspects the Chinese of much chemical knowledge, there is no doubt that in blindly following the methods handed down to him by his predecessors, the Chinaman was to a large extent carrying out a system of chemical processes. It is true we have advanced a long way ahead of the Chinese makers of tea, while the celestials have retrograded, but in considering how our present day tea-makers are sometimes charged with turning out teas inferior to those which they placed on the market some years ago, it is as well if we ask why this is, and whether they have gone too far in their mechanical modification of the old Chinese methods? Unless the "withering" be properly conducted, unless tea be subjected to precisely the *right degree* of "curing" in the withering, it is in vain to expect to turn out a first class tea with the true strength and aroma.

Our correspondent then goes on to speak of a visit which he paid to a factory where perforated wooden *boards* were used for withering, and where at the same time the closest attention was paid to the *gradual* drying of the leaf by means of a current of warm, but *not hot* air passing through and over it, with the result that the teas manufactured were all of the best quality. He writes:—From what I have learnt, care has to be taken that the withering is not pushed to excess, for by so doing the leaf will run a chance of desiccation, in which case it will not give a full-bodied liquor. The proper decree of wither is known by the pleasant aroma arising from the leaf. Regarding the process of firing, he says that the work of "tea-curing" should be by a slow, rather than by a rapid desiccation, for reflection will show that a high temperature, no matter for how short a period, will seriously affect the character of the "roll," dissipating the fine elements in the leaf which go to impart the quality of "point," so much sought for by tea buyers. In conclusion, he remarks that it is possible that any falling off in the quality of teas, instead of being due to deterioration of soil, may be owing to errors or defects in manipulation caused by a desire to work off increasing flushes of leaf, a point which it would be well to have determined. At the same time he says:—In writing as I have, I am merely conveying lessons which I have learnt from others, and must not be supposed to be taking up the *role* of amateur tea-maker

* * *

A young planter, under the *nom de plume* of "Chella," wishes us to obtain the following information for him from our district correspondents—

(i). What thermometrical and hygrometrical conditions are *the* best, for (*a*) withering, (*b*) oxidation and (*c*) firing?

(ii). Should hot moist air be employed for withering leaf? Some of the withering machines at present in use apply heated moist air to the leaf to such an extent that the leaf *discolours* in the process, turning a light fermented colour. Should the processes of withering and fermentation be combined, as they are in these machines? Should they not rather be kept quite distinct? If the combination of the processes does no harm, why should the machines not be so constructed as to include the rolling process also, at one and the same time? As a matter of fact the leaf, when it is discharged from these machines, is so bruised and mashed that it is in reality half rolled. Why then should the operation of rolling not be thoroughly accomplished in the withering machines? It would be an advantage, saving both time and the expense of rollers.

BRITISH-GROWN TEA.

Brighter Outlook.

The Statist of February 25th, remarks:—

The heavy fall in the sterling value of the rupee which took place some years ago was, for the time being, a source of considerable profit to the tea producing industry, enabling planters to reduce the cost of cultivation; but after a few exceptionally prosperous years a reaction set in This was largely owing to great increase in the acreage brought into tea cultivation. The Indian famine and the almost coincident rise in the value of the rupee completely changed the situation, and increased expenses of production to such an extent that the year 1897 proved a bad one for the industry, especially as the price of tea had fallen considerably owing to the largely increased production. The results for the year 1898 have not yet been published, and will not, as a rule, be

generally known until next May or June, but prices of both Indian and Ceylon teas were low, and will probably be below 1897, although the remainder of the crop still unsold will probably realise better figures, and consequently raise the year's average to some extent. The cost of the rupee was greater than the previous year, and in consequence production will be more expensive; while the price of rice was also high during the greater portion of the year. Bearing the above facts in mind, it is probable that 1898 will be in some instances as bad as 1897, although for some of the better teas grown in Assam the result will possibly be slightly better. Cachar and Sylhet have suffered severely from abnormal weather, which has not only caused a reduction in the output, but also interfered with the quality of the teas, and many gardens in these districts have therefore been obtaining very low prices. In Ceylon the crop has been short, so that results will also suffer from this cause.

Looking now beyond the 1898 season, there appears very strong reason to believe that the industry has passed through the worst part of the late crisis. Consumption of Indian and Ceylon tea in 1898 was 33 million pounds ahead of 1896, while production had only increased by 18 millions; and, more important still, there was an excess in production during 1896 of 12 millions, which had been turned to a deficit of 3 millions in 1898. Such a remarkable change has been brought about by a greatly increased use of British-grown teas. Not only is the home market taking more tea, but foreign and colonial markets are rapidly acquiring a taste for the teas of India and Ceylon; and whereas in 1897 51 million pounds were used outside the United Kingdom, in 1898 the quantity had risen to about 63 millions, and there appears every reason to believe that large increases will take place in the quantity used in these outlets in future. Now that the Americans have started a line of steamers, under the United States flag, going from Calcutta and Colombo direct to New York without coming near the United Kingdom, the sympathy of American shipowners will be enlisted on the side of British-grown tea. The Russian Volunteer Fleet, which calls at Colombo, is already taking large quantities of tea to South Russia, and the fact that Russian tea purchasers have established houses in Ceylon goes far to show the probability of an increased liking for Ceylon teas in Russia. The quantity shipped from Colombo direct to Russia in 1897 was only 439,349lb., and had risen to 2,714,003lb. in 1898. The absorption of British-grown tea by Russia is by close observers in the trade regarded as only in its infancy. We may now turn to production. The Ceylon output last year was reduced owing to bad weather, and it is therefore probable that the following crop may be somewhat larger. With respect to Indian, the output in Cachar and Sylhet was also reduced from the same cause as in Ceylon, and it is possible that this may not occur this year; but, considering the very large area over which tea is now grown in India and Ceylon, the weather is not likely to be suitable everywhere for the growing of large crops. So that we need not, perhaps, look for a very large increase in the 1899 crop, taken as a whole. Even though a large quantity of land was brought into cultivation some few years ago, which should now be coming into bearing, it must be borne in mind that there is reason to believe many estates have allowed some of their unprofitable tea to lapse, and that others have not had the money to carry on the cultivation which they had commenced, or even to fill up some of the vacancies which occur through plants dying out. So that, taking all these things into consideration, it is doubtful whether we shall have a very large increase in production for the present.

Looking, therefore, at the industry as a whole, the position seems to have entirely changed from what it was a year ago, and for the first time in the history of the British-grown tea trade consumption appears likely to overtake production. The possibilities opened out by the new markets are very great. For years past it has been a case of educating consumers. The efforts have had little result till quite recently, but in nearly all countries which use tea largely there is reason to believe that a very large development will take place during the next few years. It must not be forgotten that the world's consumption of tea outside countries of production amounts roughly to 500 million pounds, while the total production of British-grown tea in 1898 was only 278 million pounds, (3 millions less than the consumption), so that there still remains 222 million pounds of other growths which will, doubtless, eventually be further displaced by the energy of the Indian and Ceylon tea planters. The question of exchange must not altogether be forgotten, and, leaving out the policy of the Government, it would, perhaps, be the best thing for the tea-producing industry if the rupee were to be steadily maintained at its present level. The rapid rise in the rupee cost the tea industry an enormous sum of money, but it has had its effect in causing great efforts to be made to reduce expenditure in all directions, and has resulted in checking the annually increasing cultivation which had previously been taking place. Should the rupee remain stationary, it is possible that production would only slowly expand, and that prices of tea would advance to some extent. The trade has passed through what may be termed a very severe surgical operation. The painful process has saved the industry from a still more serious crisis, bound otherwise to have come upon it in the course of the next year or two; and if the value of the rupee be maintained where it is at present, it will probably produce a continuance of the sounder position into which the industry has now entered.

THE INDIAN TEA ASSOCIATION (LONDON.)

Mr. Blechynden's Report for the Year 1898.

New York, *Jany. 10th*, 1899.

Ernest Tye, Esq., London.

Dear Sir.—I have the honour to submit my report for the year 1898, and, as requested, make it as brief as possible.

Joint Action with Ceylon.

I have great pleasure in recording that our relations with the Ceylon Association continue most close and intimate, as I am satisfied that both Associations are great gainers by the arrangements we are thus both enabled to make. The interests of India and Ceylon tea in this country must remain identical for many years. Each country gains by the increased quantity of tea from either country taken off the London market.

Subsidies.

During the year we have continued to make grants, or subsidies, to firms pushing India and Ceylon tea in packets, and have secured the co-operation of one or two firms to push these teas in bulk. The latter method is, in my opinion, the one which would be to our greatest advantage to foster, but it presents the disadvantage that firms cannot, under present conditions, be certain of retaining the trade they open up, as there are no means of insuring the repeat orders coming to them. It is only when the tea is packed under some copy-righted name that pioneer work can be made to pay. Loose teas of almost, sometimes exactly, the same quality can be supplied by any firm in the business; and competition is so keen that our friends find that trade, that they have been at the trouble and expense to open up, is seized upon by rivals. So far as the Association is concerned, it is of course quite immaterial, so long as the tea is sold, who finally reaps the benefit; but such experiences are very discouraging to our allies. The packet tea business is, so far as firms are concerned, a much more lucrative investment. But packet teas have to be advertised to consumers, which is a very expensive matter, and though there are numerous packets in the market, there are but few firms with sufficient capital at command to make this business succeed. We have some staunch allies, and also some who are half-hearted. Others again have gone into the business with energy for a short time, but have dropped off, or will do so as the stronger houses gain ground. Our object in aiding packet dealers is not so much for what they actually sell as for the advertising they must do to have any prospect of making a business, all of which day by day familiarizes the public more and more with the merits of our teas and makes them better known. The packet teas also act as standards of quality which grocers selling our teas loose must compete with.

Lettering Stores.

We continue to letter a few stores with the words: "India and Ceylon Tea;" but as the packet business increases, the demand for a general advertisement of this nature falls off.

Demonstrations.

Less of this class of work is being done by us, and it will continue to grow less as we try to turn such work over to packet firms. These are equipped to supervise the details and to follow up work by direct sales. In my half-yearly report I referred to some work of this nature we had inaugurated in the Jewish quarter of the town, where a great deal of black tea is consumed. As there seemed to be good prospects of success, we had no difficulty in transferring the entire care of the matter to a firm which started

a special packet to meet the local requirements. They also undertook to spend a reasonable sum, in addition to our grant, in exploiting this field. They have opened a store for the sale of their packet, and have added the sale of coffee to their business, for, as usual, it is in the greatest demand: the profits on the latter go towards paying part of the expenses. So far the experiment is promising; but whether it succeeds or not is of no great moment, as demand for our tea is being established, and other packet tea firms are also reaping the benefit. Not knowing of our interest in this section of the town, one of our other allies mentioned, as a matter that might be of interest to us, that their sales in the Jewish quarter, which they had done nothing to foster, had suddenly got a start. It is thus indirectly we frequently benefit from the work we cause to have done.

TEA-ROOM.

I stated in my half-yearly report that the tea-room we had started in the previous year, and which we ran for twelve months, has been closed for want of success. While this room was in existence, it was of some use as an advertising medium but was too expensive, and we closed it with regret. Since it was closed a large dry good store in that neighbourhood has more than once been on the point of opening a similar room on its own premises, and the scheme may yet take shape. The large number of tea demonstrations given in dry good stores by firms we are in close contact with is probably one of the main obstacles to the success of independent ventures of this kind.

ADVERTISING.

During the year we have narrowed down the number of magazines we use for advertising purposes, and now use only those where our advertisement appears absolutely next to reading matter. We have for some time discontinued the use of magazines, otherwise excellent in all respects, style, circulation, &c, but which have from forty to sixty pages of advertisement matter in which any single advertisement is buried out of sight.

The newspaper advertising we do is much on the same lines as heretofore; but although it comes under the head of advertising, it might frequently be more appropriately charged under grants. The reason for this is that when firms are pushing their teas vigorously in any given town, they ask us to advertise India and Ceylon teas there We take our usual space, and advertise the teas generally. They then take a small space immediately under our advertisements. extolling the merits of their special brand of India and Ceylon tea, and thus gain the benefits of our advertisement as well as their own, getting also the advantage of the reduced rates we can secure as large advertisers. In some places we have several firms following our advertisements in this manner. We are not using a single paper in which one or more packet firms are not following us. Our advertisement of course makes the words India and Ceylon prominent; and by this means we not only advertise these teas generally, but those firms wanting to benefit by our advertisement have to use the same words on their packets and in their advertisement, instead of merely pushing the packets under the name of the brand.

We have continued to issue a large quantity of advertising matter in the shape of cards, pamphlets, &c. As has been previously described, this matter has always space reserved whereon the name of a brand or firm can be printed. We distribute all our printed matter through large firms, and they in turn distribute through stores. By this method the expense of distribution is brought down to a nominal figure. Were we to attempt to distribute independently and directly, the cost of stamping, addressing envelopes, &c, would greatly reduce the amount of work we could do, and would exceed the cost of printing. As the space reserved on the printed matter can be filled in with the name of the grocer as well as that of the brand, all parties have equal interest in getting it into circulation, and we can be satisfied that there is no waste. We have been fortunate so far in being able to prepare subjects which have proved popular and are in great demand. We could get them out by millions, instead of thousands, with equal ease and to great advantage if funds permitted.

UNFERMENTED TEAS.

Some samples of unfermented or Oolong teas made in India were sent to me early in the year. They were found so suitable for the market, and firms were so ready to give immediate large orders, that I have had to revise the opinion I formerly had as to the impossibility of Indian gardens preparing suitable teas of this class. I now believe that there are certain districts in India where Oolong teas of a character to command ready sale can be made, and that if such teas are produced, there is practically no limit to the business that could be done. I have dealt with this matter at length in another place. so will confine myself here to adding a warning, so that the same stumbling block which our black teas encounter every day may beavoided. I refer to the

INEQUALITY OF THE TEA.

It does not appear to matter what tea finds favour here, as soon as one lot of it is sold, and orders are ready for more of exactly the same tea. there seems an impossibilty of supplying them. In filling the repeat orders the leaf or liquor, or both, differ from the original, and there is no firm in business on this market which will guarantee to duplicate any given sample of tea exactly This is one of the most serious obstacles to the expansion of the trade. More than two years ago I urged careful consideration being given to the question of blending teas in Calcutta for this market as the one possible means of supplying a standard article. Now that there is a question of manufacturing a special tea, I feel it my duty to make this point very clear, as the success of the enterprise will depend in a great measure on supplying exactly the tea ordered—not a tea which resembles it, or which may even be thought better. The experience of what was done in the London market cannot be taken as a guide, conditions being different. It a tea (black or green) is found acceptable here, means should be found to supply that identical article. The cost of holding the tea and blending until the standard is reached will not be lost.

GENERAL.

The year 1898 will long be rememberd as an exceptional one by the Tea trade of America. The period under review was marked by the war with Spain which necessitated the taxation of tea as a war measure. The imposition of duty having been threatened in the previous year, and being withdrawn in the face of the objection of its undue incidence on the poor man, came as a surprise to the trade, and caught it quite unprepared. The only tea it was possible to rush in before the act became law was that in the Canadian market, whence a fair quantity was drawn. There was a sudden boom in prices and a great deal of tea changed hands, but with the imposition of duty the merchants cabled to China and Japan cancelling buying orders and a long period of great depression ensued. During the previous season the new Tea Act had become law under which certain standards of tea were selected and much inferior rubbish heretofore finding a ready market here was kept out. The action of the law had been to reduce the imports of the previous season, and the imposition of a duty of 10 cents per lb, added to the impossibility of importing cheap teas, still the retailers would not pay an enchanced price and business came to a standstill. It was then found that there were quantities of tea left over from previous seasons which had been looked upon as unsaleable, and some of which had been stored in this country over 20 years The novel conditions placed a premium on the antique rubbish, valued previous to the passing of the duty, at say 4 cents per lb. It was dragged forth once more into the light of day and sold at prices ranging up to 20 cents per lb. The stocks held all over the country proved a surprise to the trade, and it is only now that they are getting exhausted. What these stocks must have been can be gathered from the fact that, although the importations of all teas into this country since the 1st of June to the 30th November were approximately 40 million lbs., the amount of tea which has paid duty, or in other words has been put upon the market, was only 12 million lbs., approximately, in the same period. I am unable to quote the figures for December, inclusive, as they have not so far been published. With the trade in this condition, the sales of India and Ceylon tea have of course suffered, but less I think than those from other countries The fact that any India and Ceylon tea has been sold speaks highly for the vitality of the demand which has been created for them. It must be borne in mind that China and Japan manufacture a distinct class of tea for sale to America alone, and which has no sale elsewhere. These teas once manufactured must come here, there being no other market for them and once here have to be sold, even at great loss, to meet bank obligations and so on. India and Ceylon teas have other markets, and are imported only to meet actual or anticipated demand, and can be diverted to other markets. Under the circumstances, it is a matter of some surprise to me that so much business has been done in them during the last disastrous six months. There is an artificial demand for the packet Indian and Ceylons, created

purely by advertising; and it is within my knowledge that the past year has been quite up to the average with the packet tea firms: indeed some of them have done quite well, and even extended their business. Now that stocks are approaching exhaustion, I look very confidently forward to a widespread and lasting demand for tea from all parts of the country Stocks must be renewed, and though the fear remains that the duty may be removed at any time, and will curtail orders to actual requirements, the market will gain by the steady demand this method of doing business will bring about, and will be saved the unhealthy effects of a sudden boom. Conditions point to our gaining more than our due share of business, as the crop of China and Japan is estimated to be at least six million lbs. short of last year, to which has to be added the rejections, which will be at least another million lbs. If my estimate of the position is at all accurate, it appears to me that an unusually large quantity will have to be drawn from other markets before new season's China and Japan come in. Before closing this report, I have to record considerable more activity on the part of the advertisers of Japan tea. With the commencement of the new year, they have. I understand, made contracts for quite an extensive scheme of advertising, some of which is already in evidence.

I am, sir,
Yours faithfully,
(Signed) Richard Blechynden.

MARKET REPORT.

Per Mail advices of 3rd instant.

COFFEE.

The *London Commercial Record* says:—The market exhibits unusual depression for this time of year and, except for the limited supplies of attractive quality, sales are difficult to effect, and a large proportion of the quantity offering at auction had to be withdrawn for want of adequate bids. Ceylon fully maintained its recent high value. The quality of East India submitted to public competition shews no improvement, and this added to the flatness previously prevailing; a large percentage failed to attract offers either from the home trade or export, and where sales were made prices further declined 2s to 3s per cwt., except for high-grown fancy marks. Jamaica 1s per cwt., cheaper on the week, and a similar reduction must be reported for Central American descriptions—in some instances a further fall has been submitted to. "Futures" have been irregular; at one time there was more firmness and a slight recovery in prices took place, but the close is weak and quotations are easier, owing principally to excessive receipts at shipping ports. We quote:—

London ...	Santos ...	March delivery	..	29s 3d
New York ...	No. 7 Rio ..	„ „	...	5.20 cents
Hamburg ...	Santos ...	„ „	..	29¾ pf.
Havre ...	Santos	„ „	...	35½ francs
Holland ...	Good ordinary Java	...	..	30 cents.

The Dutch Trading Co. announce their next public sale for Tuesday the 7th inst. at Rotterdam, when 22,790 bags 20 cases Java will be offered; good ordinary is valued at 30½c

Imports Deliveries and Stock of Coffee in London are as follows:—

Auctions this week have gone off as under:—

Ceylon *Plantation*.—48 casks 8 tierces 16 barrels 7 bags sold—smalls 55s to 82s, low middling to middling 91s to 104s, bold to extra bold 104s 6d to 113s, pea-berry 96s to 116s.

East India.—Of 2,679 bags offered a small part sold:—*Mysore* smalls 40s to 45s 6d, middling dull gray 61s 6d, bold faded greenish 80s to 90s, pea-berry 85s to 98s 6d. *Coory* smalls 43s to 44s 6d, low middling to middling 62s to 65s 6d, bold good colory 90s, pea-berry 90s to 101s. *Wynaad* smalls 43s 6d to 46s 6d, low middling 50s to 57s, bold 70s to 76s 6d, pea-berry 86s 6d to 91s. *Neilgherry* smalls 42s 6d to 47s 6d, low middling 53s 6d, bold rough gray 68s, good to fine bright gray 80s to 90s 6d, pea-berry 65s to 80s.

Nyassaland.—430 bags withdrawn.

Jamaica.—Of 172 barrels 121 bags offered, 53 barrels 30 bags sold—small brownish colory 30s to 36s, fine ordinary brownish 42s, low middling 49s 6d, bold ditto 58 6d, pea berry 40s to 51s 6d.

Colombian.—2,158 bags mostly sold—smalls 30s to 48s., fine ordinary 41s to 45s, low middling to middling 50s to 59s, middling to good middling colory 60s to 69s 6d, bold good colory 74s to 76 6d, good hard gray 76s 6d, fine bold 83s to 83s 6d, pea-berry 36s to 79s 6d.

Savanilla.—290 bags mostly sold—smalls 31s to 35s, low middling to middling 51s to 57s 6d. good middling 69s 6d, pea-berry 57s to 60s 6d.

Mexican.—Of 388 bags offered 200 bags sold—smalls 37s 6d to 44s. low middling dull gray 53s, good middling blue 69s 6d, fine bold hard blue 91s 6d, pea-berry 95s; damaged and bulked: small dark mottled green 28s to 31s 6d, medium 39s, bold 45s, pea-berry 40s to 45s.

Guatemala.—373 bags old crop, mostly sold—ordinary brownish 27s to 27s 6d, small 32s, good ordinary dingy greenish 34s to 36s 6d, good bold colory 68s 6d, pea-berry 70s.

Porto Rico.—Of 400 bags offered 100 bags sold—good bold polished colory 56s to 56s 6d.

Bolivian.—8 bags small greenish sold at 24s.

Costa Rica.—Of 356 bags offered 100 bags sold—smalls 32s, low middling greenish 56s 6d, good middling green 74s 6d, peaberry 50s.

Salvador.—196 bags bought in.

Vera Paz.—84 bags bought in.

Nicaragua.—60 bags taken out.

Venezuela.—358 bags all passed the hammer unsold.

Bolivian.—35 bags withdrawn.

Ecuador.—20 bags bought in.

Bahia.—100 bags retired.

Brazil.—193 bags Santos bought in.

Auction supplies to-day embraced:—20 casks 6 tierces 18 barrels 3 bags Ceylon, 15 bags East India, 91 half-bales Mocha, 20 bags Nyassaland, 11 barrels 325 bags Jamaica, 2,163 bags Costa Rica, 121 bags Guatemala, 359 bags Mexican, 804 bags Columbian, 30 bags Nicaragua, 18 bags South Sea Island, 194 bags Venezuelan, 42 bags Peruvian. 168 bags New Granada, 61 bags Coban, 240 bags Vera Paz, and 152 bags Santos. The sales went slowly and prices were generally in buyers' favor.

RECEIPTS IN RIO AND SANTOS.

Since July 1	1898-9 Bags.	1897-8. Bags.	1896-7. Bags.	1895-6. Bags.
Rio	2,362,000	3,305,000	2,665,000	1,889,000
Santos ...	4,552,000	5,168,000	4,194,000	2,675,000
Total ...	6.914,000	8,473,000	6,859,000	4,564,000

Rio Exchange 6 3/32d, previous day 7d

Havre, March 2.—Santos good average March opened quiet at 35¾f. and closed quiet at 35½, May opened at 36¼ and closed at 36f.

Hamburg, March 2.—Good average Santos March opened quiet at 30pf and closed quiet at 29¾pf, May opened at 30¼pf and closed at 30pf.

New York, March 1.—Closing prices of No. 7 Rio were as follows:—

	Mar.	April.	May	June.	July.
March 1 ...	5.30	5.35	5.40	5.50	5.55
Feb. 28 ...	5.25	5.35	5.40	5.50	5.60

Messrs. Wm. Jas. & Hy. Thomnson's Report of the Colonial Markets for the week ending March 1st, 1899, states :—

This market closes flat and lower for all kinds except finest. The supply of East India brought forward consisted chiefly of gray and undesirable qualities, and these met with a very poor demand, and were mostly sold at very irregular prices, the decline being fully 2s. to 4s. per cwt. Central American kinds are also lower. Brazil markets flat.

Futures have ruled quiet and featureless, closing unchanged to 6d. lower, viz.:—Good average Santos in Havre, May delivery, fcs. 36.50, in Hamburg pf. 30½, and No. 7 low ordinary Rio in New York $5.40

Prices realized at auctions for the principal Marks of East India :—

TEA.

Indian.—Public sales were rather heavier, amounting to 45,400 packages, compared with 41,800 packages in the preceding week and 35,300 packages a year ago.

There was again a good enquiry for leafy kinds under 8d per lb., which ruled firm to occasionally dearer, the supply of these available being apparently barely sufficient for the current requirements of buyers. Medium to fine Pekoes and Broken Pekoes were not in so much request and were at times easier, particularly in the case of the latter which look comparatively cheap at present rates. Finest grades were somewhat neglected, dealers' attention being principally engrossed with the lower descriptions.

A fair selection from South India was included in the catalogues, quality being generally of a useful character, many of those from Travancore possessing colory liquors.

Deliveries for February are satisfactory, being 11,931,000 lbs., against 11,0[illegible]3,000 lbs. last year, thus indicating an increase for the eight months from 1st July, 1898, of 10½ million lbs. over those of the corresponding period of 1897-1898.

For 33,200 packages on estate account 9d per lb. was obtained, contrasted with 8d per lb. for 26,700 packages and 9½d per lb. for 26,900 packages in the two previous seasons.

Ceylon.—A large quantity passed the hammer, totalling 20,400 packages whereas on the 21st ult., 14,100 packages were catalogued, but at this time in 1898 there were 32,200 packages brought forward. Choice flavoured parcels over 1s per lb were sparsely represented; quotations however did not mark much change. For medium Broken Pekoes with serviceable infusions there was more demand and some recovery in prices took place over 9d per lb. Medium to fine Pekoes and Orange Pekoes as a rule sold dearer, while common to fair Pekoe Souchongs and Pekoes in sympathy with other growths further advanced in most instances ¼d per lb.

Owing to the small proportion of the upper lines the average remains as on the 23rd ult. viz., nearly 8¾d per lb. In 1898 it was rather under 7½d per lb.

During February auctions comprised the following:—

1899.	1898.	1897.
73,300 packages	100,100 packages	84,500 packages
(Avge. 8½d per lb.)	(Avge. 7½d per lb.)	(Avge. 8¼d per lb.)

Java.—Rather over 1,000 packages of direct import were put out on the market. Bidding was brisk and fully prior values were secured.—

In the month offerings were:—

1899.	1898.	1897.
6,100 pkgs.	2,800 pkgs.	4,500 pkgs.
(Avge. 7¼d per lb.)	(Avge. 6¼d per lb.)	(Avge 6d per lb.)

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns were:—

From 1st to 28th Feb., 1899 ... ... 16,989,558 lbs.
„ „ 1898 ... ... 15,926,157 „

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	38,826	6,545	45,371
Ceylon...	19,453	970	20,423

Total ...	59,279	7,527	66,806

Also 964 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report of March 3rd, 1899, states:—

QUANTITY BROUGHT TO AUCTION IN LONDON
From 1st June to Date.

	Indian.	Ceylon.	Java.
1898-1899.	1,335.247 pkgs.	848,983 pkgs.	35,566 pkgs.
1897-1898.	1,296,478 „	908,946 „	30,489 „

46,346 pkgs. Indian
20,940 „ Ceylon
1,012 „ Java
} Total 68,298 packages were offered in public auction this week.

Clearances of Indian Tea were lbs. 900,000 above February last year, and have now brought up the excess in Indian deliveries, from the commencement of the season, to lbs. 12,000,000.

Indian.—The late advance was maintained for all Teas up to 7½d.; above this price, weakness was noticeable, except for choice descriptions. The Official Wire gives export to the United Kingdom for the second half of February as lbs. 778,000, against lbs. 930,000 same month '98, making total from 1st April to end of February of lbs. 134,715,000, against lbs. 133,350,000.

Week's average of Tea sold on Garden Account 1899, 33,544 pkgs., av. 8·97d. 1898, 26,911 pkgs., av. 8d.

Ceylon.—A further slight advance has taken place in Teas up to 7½d with very strong competition, while medium and good Teas showed a somewhat firmer market than last week. The Official Telegram gives exports to U.K. for February as lbs 7,750,000, against lbs. 6,750,000, making the total from 1st January to end of February as lbs. 14,500,000, against lbs. 14,750,000, and estimates the quantity for March as 8 to 8½ millions. Average for week 8·57d., against 7d, same week 1898.

Java.—Quotations were fully up to those of last week, common Teas being if anything a shade stronger. Some fine Teas from "Calorama," grown from Assam seed, realised high prices. 9,000 packages are advertised for sale in Holland on the 9th March.

Bank Rate 3 per cent. Exchange on London three months-sight:—Calcutta 1/4 5/32. Colombo 1/4 5/32.

COCOA.

Offerings at Tuesday's public sales summed up 5,860 bags, which again experienced a good demand, 4,100 bags being quitted at generally full prices. Of 2,082 bags Trinidad catalogued about 1850 bags sold at valuations—75s 6d to 77s 6d for fine to superior red, 72s to 75s for middling to good, 70s to 71s for ordinary, 69s for weathered, pickings 60s to 65s 6d. Of 534 bags Grenada offered 440 bags found buyers at 70s 6d to 72s 6d for good to fine red, and 68s to 70s for middling to fair, showing no appreciable alteration. 33 bags Dominica brought 68s, and 47 bags good fermented Jamaica 71s 6d, whilst 22 bags good pale St Lucia realised 69s to 70s, these prices likewise being steady. 13 bags Tobago were placed at 69s 6d to 71s 6d. and 31 bags Surinam at 69s 6d. 400 bags Guayaquil sold at about recent rates—72s for Winter Arriba. 71s to 73s 6d for Tenguel, and 70s for grey Caraquez. 2 bags common African sold at 64s. Ceylon went somewhat irregularly, but the general range of values showed little change; 1,994 bags catalogued, and 1,260 bags sold—good to fine bold and medium red 72s 6d to 79s 6d, fair ditto 69s to 70s grey medium and small 65s 6d to 66s, pickings 56s to 67s 6d per cwt.

PEPPER.

Black.—A firm market this week but not much business done. Sellers standing out for a further advance About 100 tons Singapore are reported sold—at 5 5/16d to 5 3/8d for fair on the spot, at 5 19/32d for March-May shipment, and at 5⅝d to 5 21/32d for April-June.

The shipments of Black Pepper for the month of February compare as follows:—

	1st half. 1899.	1st half. 1898.	2nd half. 1899.	2nd half. 1898.
U.K.–Sing ... 50	75	230	50	125	60	180
„ Penang... 25		*nil*	75		120	
Continent	30	40	140		130	
United States... ...	150	*nil*	*nil*		40	
Total tons ...	255	270	265		350	

There were no offerings at Wednesday's public sales.

White is quiet, with sales of 70 to 80 tons, including Singapore on the spot at 8¾d to 8 13/16d for fair, and March-May steamer at 9d; Penang on the spot at 7⅞d, and March-May and April-June shipment at 8¼d per lb.

At auction on the 1st inst. of 388 bags Singapore offered only 12 bags sold at 9⅛d for bold dullish. 8 bags Penang realised 7¾d per lb.

GINGER.

Cochin.—Catalogues embraced 198 cases 891 bags which experienced a desultory enquiry. 18 cases 180 bags selling at a decline of about 3s on new crop cut, whilst washed, of ordinary quality, was also cheaper. Good bold with some medium cut and scraped new crop realised 80s, and small cut ditto 35s; bold, some medium roughly cut wormy old crop 61s, small cut ditto 20s 6d to 24s 6d.

according to proportion of worm eaten; rather dull and leanish medium and small washed rough (July, 1895 import) 23s, ordinary lean medium and small rough, wormy, 19s 6d, and bold but wormy cuttings 17s per cwt.

Jamaica in good demand at somewhat irregular rates.

VANILLAS.

At auction yesterday 1,251 tins (a record quantity) were brought forward, the great bulk consisting of new crop Seychelles. A strong demand prevailed, the home trade being the chief buyers, and 1,180 tins sold in the room at fully valuations for fair to fine quality beans, whilst ordinary and common brought some advance. The following are the prices realised:—Seychelles, good to fine, 8 to 9 inches 25s 6d to 27s; fair to good, 7 to 8 inches 21s to 24s; good, 6½ to 7½ inches 21s to 23s 6d; fair to good fresh, 6 to 7 inches 20s to 22s, 5 to 6½ inches 19s to 22s, 3 to 5½ inches 18s to 21s 6d, 5½ to 7 inches 20s to 23s; fair to good split, 4½ to 7½ inches 17s to 22s; reddish, 5 to 7 inches 14s to 18s; red, 3 to 7½ inches 11s to 16s; common to ordinary red and split, 3½ to 7½ inches 10s to 16s; cut ends 14s to 19s; loose, very common 8s 6d to 9s. Mauritius, good fresh, 7 to 8 inches 23s 6d to 24s, 6 to 7 inches 22s to 23s 6d, 5 to 6 inches 21s 6d; split, 4½ to 8 inches 18s 6d to 21s 6d. Split Bourbon, fair, 4½ to 5 inches 22s to 23s. Fair Tahiti 10s 6d per lb.

CARDAMOMS.

A sale was announced for yesterday but did not come off. Business privately has been confined mainly to good seeds at 2*s.* 9*d.* per lb. and a few lots of ordinary pods at last sale rates. Fine Ceylon Mysores are still in request, but none is to be had even at the high rates offered.

INDIA RUBBER.

Prices for Pará kinds have advanced during the week with few sellers and rather strong demand for covering 'bear' sales. About 100 tons fine hard and soft up to 4s 3d, distant delivery at 4s 3¼d; large sales of scrappy negroheads at 3s 7d and buyers, Cameta negroheads 3s 0½d per lb.

At auction to-day:—

Pará.—20 packages sold, coarse enterfine 3s 10d to 4s 0¾d, scrappy negroheads with some virgin at 3s 8d.

Molledo higher; 7 packages sold, fine at 4s 1½d, enterfine at 4s 0¾d, negroheads at 3s 6¾d.

Mattogrosso sells readily. 375 packages sold—virgin slab at 3s 10d, negroheads, ordinary to good 3s 2½d to 3s 4¼d.

Mangabeira.—In active demand. 39 packages sold—fair middling sheet 2s 5½d to 2s 6¾d.

Bahia—Fair to good 2s 5¼d to 2s 5¼d, ditto inferior 2s per lb.

Mozambique sells readily at high prices. 119 bags sold—good red ball at 3s 7¼d, mixed white ball 2s 6d, fine niggers at 3s 4½d. Lamu ball, fair to good 3s 3½d to 3s 4¼d per lb.

Nyassaland.—Good clean red ball 3s 5½d, ditto a little sandy 3s 3½d.

Penang.—188 packages offered and 55 sold—selected red firsts 2s 11½d to 3s 2¾d, ordinary white firsts 1s 11d, very good pickings 1s 4¾d, ordinary pickings 1s.

Borneo held too high. 48 packages offered and a little fair but mixed sold at 1s 10d per lb.

CINCHONA BARK.

2,608 pkgs. were catalogued at yesterday's auctions, divided as follows: 443 bales Ceylon (335 sold); 1,241 bales 55 cases East Indian (794 bales sold); 380 bags 40 bales Java (all sold); 208 pkgs. South American (102 sold), and 235 bales African (all sold)

There was a strong demand, and much higher prices were realized, the advance on last London sales being fully 50 per cent; we now quote the unit value at 1⅜d. to 1 7/16d., against 1 5/16d. to 1d. at the January sale. The shipments of Java Bark for February are only 539,000 lbs.

At the second London auctions of the year held on Tuesday nine brokers offered supplies amounting to 2,608 packages (1,911 in January), made up as follows:—

	Packages offered.		Packages.
East Indian cinchona...	1,296	of which	828 were sold.
Ceylon cinchona ...	442	„	334 „
Java cinchona... ...	420	„	420 „
African cinchona ...	235	„	235 „
Cuprea cinchona ...	140	„	54 „
Bolivian-Calisaya cinchona	42	„	42 „
Cartagena cinchona ...	26	„	26 „
	2,601		1,939

There was a good competition, and the prices obtained were about 10 per cent. above the recent Amsterdam sales. The average unit was 1¼*d.* to 1⅜*d.* per lb., against 1 5/16*d.* to 1*d.* at the last London sale. Cinchonidine-yielding barks realised in some instances much higher prices than those paid in Amsterdam, and 1½*d.* may be put down as the unit for good Succirubra.

The following figures represent the approximate amounts of bark purchased by the principal buyers:—

	Lbs.
Mannheim and Amsterdam factories	221,966
Messrs. Howards & Sons	69,143
Brunswick factory	68,980
American and Italian works	31,864
Frankfort and Stuttgart factories	13,030
Imperial Quinine factory	3,172
Druggists, &c.	8,830
Total quantity sold	416,985
Bought in or withdrawn ...	160,297
Total quantity offered	577,282

The following prices were paid:—

South American.—Bolivian cultivated calisaya, fine quill, 7⅝*d.* per lb. Cartagena, bold flat, 4½*d.*; damages, 4*d.* to 4⅜*d.* Cuprea (imported August, 1884), 1¾*d.* to 1⅞*d.* per lb.; ditto (imported August, 1884), 2*d.* For 6 bales of soft Colombian 2⅜*d.* per lb. was bid and refused, the parcel being bought in at 3¼*d.*

Java.—Good rich natural Ledgeriana stem chips, 8⅛*d.* to 8¾*d.*; fair to good, 6¾*d.* to 7½*d.*; fair, 4⅞*d.* to 6¼*d.*; branch at 3¼*d.* to 3¾*d.*, root at 5½*d.* to 7¼*d.* per lb.

African, fair bold chips, 6⅝*d.* to 7¼*d.*; broken quill and chips, 5⅜*d.* to 6⅜*d.* per lb.

Ceylon.—Officinalis, good renewed quilly chips and shavings, 4¼*d.* to 5¼*d.* per lb. Succirubra stem chips, 3*d.*; renewed ditto, 3⅜*d.* to 4¾*d.*; good root, 4*d.*; Ledgeriana original stem chips, 6⅝*d.*; and hybrid renewed chips at 4⅝*d.* per lb.

East Indian.—Ledgeriana, fair to good chips, 4⅛*d.* to 5*d.*; ditto renewed, 5⅜*d.*; good broken quill and chips, 3⅛*d.* to 3¼*d.*; stem and chips, 5*d.* to 6¾*d.*; and root, 5½*d.* Crown chips, 5⅛*d.*; renewed ditto 3¼*d.* to 6⅛*d.*; stem and chips, 1⅝*d.* to 4⅛*d.* per lb.

The highest price ever paid for bark in the London market, according to Messrs. Woodhouse, was in 1877, when some renewed officinalis bark from the Nilgiris plantations was sold at 15*s.* 8*d.* per lb.; supposing this parcel to have contained 6 per cent. of crystallised sulphate of quinine the value of the unit would have been at that time over 2*s.* 6*d.* per lb.! As late, however, as the year 1880 considerable quantities of bark were sold at about 2*s.* per unit per lb. From that time the market has been steadily declining until the lowest point was reached in January, 1897, when the public sales in Holland sold at an average unit of 2.12c. per ½-kilo (equivalent to under ½*d.* per lb.). In 1877 Howard's quinine (in bottles) was sold at 15*s.* per oz.; on December 31, 1878, their quotation was 12*s* 6*d.* per oz.; on December 31, 1886, 2*s.* 6*d.* per oz; falling by degrees in sympathy with bark till the lowest point was touched in 1897, when business was done at 10*d.* per oz.; at this time sales of German quinine (best marks) were made at 7½*d.* to 8*d.* per oz.—the lowest price on record.

The arrivals of Java bark in Amsterdam last week amounted to 1,1•8 packages; and the total shipments from Java during February were 539,000 Amsterdam lbs., making a shortage for the two months of 700,000 lbs, compared with last year. The following are the totals in Amst. lbs. for the last four years (January and February):—

1899	1898	1897	1896	1895
1,048,800	1,656,000	876,000	1,516,000	1,413,000

Since the auction there has been rather eager buying by manufacturers (especially B. & S.), who have paid from 10 to 20 per cent. above Tuesday's prices for bark on the spot. In all cases immediate delivery has been stipulated. The Amsterdam sales to be held on March 23 will be small; the offers being 4,293 packages of Ledgeriana and other manufacturing barks, and 2,553 of druggists' barks. These 6,846 packages are part of the total stock of 9,231 packages held in Amsterdam on March 1 (2,738 Government bark, and 6,498 private) The deliveries during February amounted to 4,700, and the imports 3,000 packages. In regard to the stock in London (19,257 bales) only 6,766 bales are manufacturing bark, and more than 8,000 of the balance are fit for manure.

Amsterdam Bark Market.—At the bark auctions to be held on the 23rd inst. a total of 6,846 packages will be offered. Including this amount the Amsterdam stock of bark in first-hands, on the 1st inst., was 2,738 packages of Government bark, and 6,493 packages of private bark, or a total of 9,231 packages. We give the shipments from Java for the month of February, and the two months January, February, of the last seven years, stated in English pounds.

	1893.	1894.	1895.	1896.	1897.	1898.	1899.
Feb., lbs.	388,255	500,920	826,875	597,170	498,750	765,625	589,505
Jan.-Feb.	1,153,880	1,484,210	1,545,460	1,669,045	925,995	1,811,220	1,147,125

CINCHONIDINE.

Firm, as is to be expected from the state of the quinine market. Holders of what small supplies are available on the spot are inclined to refuse business until the market warrants materially higher prices. As a rough quotation 8*d.* is given as representing the value to-day. It is not likely that any buyers will pay this price at the moment.

QUININE.

Firm, with sales of 30,000 ozs. best German makes—at 1s to 1s 3¼d spot, and 1s 3½d May delivery.

The *Chemists and Druggist* of 4th instant remarks:—Quinine h recovered from the inactivity of last week, and on Monday t market opened with a good speculative demand, about 30,000 changing hands on that day at 1*s.* 1⅞*d.* per oz on the spot, Ap at 1*s* 1⅞*d.*, and May at 1*s.* 2*d.* After the London bark-sales Tuesday the market was again animated, and about 70 000 oz. so at 1*s.* 1⅝*d.* to 1*s.* 2½*d.*, and May delivery at 1*s.* 2¼*d.* to 1*s.* 2⅝ Yesterday 1*s* 3*d.* spot and 1*s* 3⅛*d.* to 1*s.* 3½*d.* May-June were pa the sales and resales amounting to about 200,000 oz., and B. & advanced their price by 1*d.* to 1*s.* 3*d.*, which is also Brunswick a Zimmer's price. Whiffen is selling to consumers at 1*s* 2*d.* Freu quinine sulphate (guaranteed B. P.) is selling at 1*s.* 1*d.* Busine has been done to-day at 1*s.* 3⅜*d.* for May, and 1*s.* 3½*d.* is n wanted. Spot has sold at 1*s.* 3¼*d.* The operations of speculato this week have come to 500,000 oz, or thereabouts. It will noticed that the imports of quinine during February and the sto on February 28 were exceptionally large—in fact, there is mo quinine in the warehouses just now than there has been for fo years.

Movements of Tea in London (in lbs.) during February from Tea Brokers' Association figures.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 7th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

BRAZILIAN COFFEE.

Mr. R. E. Johnston writes to the *Grocer*, that though there is no doubt about the abundant supply of coffee, nor about its cheapness, he is afraid that there is small chance that the United Kingdom will share in the anticipated increase in consumption, so long as the retail prices for pure coffee remain what they are, and so long as people are repelled from drinking coffee by the mixtures which are sold in its place. The fact is that Brazilian coffee goes in comparatively small quantities to the United Kingdom, the United States taking the bulk. Nevertheless the price of Brazilian coffee is a factor of the utmost importance, as it regulates the price of all low-grade coffees, and no doubt affects the value of some of the medium-to-good grades also. The following table shows the production of coffee in Brazil and in the world since 1874, and the average price taken at Havre:—

Crop.	Brazil.	Other.	Total.	Per 50 kilos.
1874-75 (bags of 60 kilos.)	3,843,600	4,295,400	8,139,000	103 fr.
1875-76	3,505,800	3,679,200	7,185,000	106
1876-77	3,294.000	4 520,000	7,814 000	101
1877-78	3,498,200	4,017.800	7,516,000	96
1878-79	4,718,000	4,20 ,000	8,918,000	76
1879-80	3,172,000	5,413,000	8,585,000	84
1880-81	5,553,000	4,205,000	9 758,00	75
1881-82	5,562,000	4,829,000	10,391,000	57
1882-83	6,711,000	5,369,000	11,080,000	50
1883-84	5,056,000	4,711,000	9,767,000	62
1884-85	6 211,000	5,229 000	11,440,000	52
1885 86	5,532,000	3,956,000	9 488,000	48
1886-87	6,129,000	4,183,900	10 312,000	81
1887-88	3,006,000	4,071 000	7,077,000	94
1888-89	6,735,000	3,863,200	10,598,300	97
1889-90	4.220,000	4 438 200	8,658 200	103
1890-91	5,308,000	3,989 000	9 297.000	109
1891-92	7,376,000	4,482,000	11,858,000	91
1892-93	6,193,000	5,090,000	11,283,000	97
1893-94	4,307.000	4 895,000	9.202,000	103
1894 95	6.689,000	4,947,000	11,636,000	94
1895-96	6,250.000	3,944,000	10,194,000	90
1896 97	8,680,000	3.928,000	12,608,000	61
1897-98	11,110,000	4,600,000	15,710,000	39

The average price in April, 1898, was 35 fr. 50c.; in May 36 fr. 25c.; in June, 36 fr. The highest prices ever reached, were 123 fr. and 120 fr. at the end of 1887, and the lowest monthly average previous to 1897-98 was 46 fr. during 1885-86. Of the other coffee-producing countries the production of the East Indies, including Ceylon, has fallen off from 1,079,000 bags in 1895-96 to 972,000 bags in 1896-97. Central America shows a slight increase from 2,865,000 bags in 1895-96 to 2,956,000 bags in 1896-97.

A consular report issued a little time ago said:—"The crop of 1898 promises to be smaller than that of 1897, but the stocks in Europe and in Brazil being so exceptionally large, it may be many months before, owing to diminished production, prices can recover." Since then, however, estimates have been 'growing' and though the Brazilian estimates appear to be lower for 1898-99 than for 1897-98, outsiders are beginning to fear that large supplies are being held by Brazilian producers "up their sleeves." Statistics of export up to February 3rd, 1899, are as follows:—

	Crop to February 3rd			
	No. of bags.		Value.	
	1897-98.	1898-99.	1897-98.	1898-99.
			£	£
Rio	2,870,647	2.105,945	4,803,877	3,284,487
Santos ...	4,206,846	3,935,325	7,619,032	6,506,335
Total ..	7,077,493	6,041,270	12,422,909	9,790,822

Deliveries in the United States have fallen off from the high figures of 1897-98, and prices in that market have taken a downward turn. The total visible supply of the world on February 1 was 6.558,114 bags, against 6,031,474 bags at corresponding date in 1898—an increase of 526,640 bags.

The *American Grocer* remarks:—"From the present outlook the Brazil crop of 1898-99 will yield 8,500,000 to 9,000,000 bags, making a total in three years of about 28,000,000 bags, or an average of 9,333,000 bags. During this period the visible supply or reserve of the world has risen from 2,588,193 bags on July 1, 1896, to 6,558,114 bags on February 1, 1899; so that a deficiency of 2,000,000 bags in the 1898–99 crop, as compared with 1897–98 is more than made good by the increase in the world's supply." The *cause* of the recent drop in values of 'futures' in New York can scarcely be the statistical position of the commodity and nothing more. Latest advices from Brazil lead us to fear that exporters there are again reaping a harvest from a slump in exchange. So long as they are thus favoured production will be stimulated and prices will have a tendency to fall. It is worth noting that in the face of low prices, in the face, too, of statistics as to an abnormal 'world's supply' and an almost stationary level of consumption, the *Reporter of Ribeirão Preto* considers the future of the coffee industry hopeful and incites planters, especially those of the district of Ribeirão Preto in the following terms:—"We advise planters of Ribeirão Preto to courageously continue the cultivation of coffee in this district, more especially as the soil here is more adapted for it than elsewhere and for this reason will be the last place to suffer by the fall in prices. It would be folly, therefore, to abandon such a profitable culture for others which are here generally inferior to those produced elsewhere"

INDIAN TEA IN THE UNITED STATES.

The interim report of the American and Foreign Tea Committee of the Indian Tea Association (London), which is given on another page, derives its chief interest from the reference it makes to Mr. Richard Blechynden's report, dated 10th January 1899. This report was given in our last issue. It showed that excellent work had been done, that not only the sympathies but also the practical co-operation of various firms in America had been secured, and that Mr. Blechynden was sanguine that Indian and Ceylon teas might expect to meet with increasing demand in the States. There is certainly nothing in the report that would lead us to suppose that Mr. Blechynden considers that he has accomplished the work he set his hand to. Hopeful as he is, the whole tenor of his remarks leads us to the belief that he considers there is still a great deal of hard work to be done. However, the American and Foreign Tea Committee of the I. T. A. holds that "a trade has now been established which may be expected to continue to increase." In the opinion of the Committee, the work Mr. Blechynden has been engaged in during the last five years has been productive of much benefit to the industry and has been well performed, *but*,—"there are now so many well-established and powerful agencies at work in the United States and Canada, whose interest it is to push British grown tea . . . that the Committee consider the further expansion of the trade may safely be left in their hands, and that it is not necessary to continue a special agency for the propose." The Committee intends, in fact, to give more attention in future to the other new markets for British teas that are opening out on the Continent, particularly in Russia and France, and especially in connection with the Paris Exhibition in 1900. Money will still be required, so the Committee recommends "that a levy be raised in Calcutta on the same lines as before,

but on the understanding that the funds shall be employed to push Indian teas in any part of the world and not in the United States only.

No doubt, the Association knows its own business best, and if it adopts the report of the above Committee, we must assume that it has good reason for doing so. Yet it is only fair to say that there is absolutely nothing in the reports hitherto published that, in our opinion, justifies the proposed cessation of a special campaign in America, especially at a time when people interested in Japan teas are beginning to manifest special activity. We neither think that Indian tea has established a permanent connection in the States on a sufficiently broad and sound basis, nor that the new plan of pushing in various markets simultaneously will meet with the success that has attended concentration of effort. Time alone can show, however, whether this view is a correct one, or if the Committee referred to is right in recommending that Mr. Blechynden's services in America be dispensed with at the close of his present agreement, in (we believe) May next.

TEA IN CANADA.

Mr. R. G. Pineo has returned to Colombo after several years' absence, part of the time having been spent in Canada. He has been promptly interviewed, and what he says may be summarised thus:—He is representing tea buyers in Canada, and will buy solely for the Canadian market. He is the first Canadian representative in Colombo, and contemplates staying in the island permanently. Ceylon tea is coming largely into consumption in what are known as the maritime provinces of Canada. The consumption there is much larger than in the upper part of Canada, where they are accustomed to drinking Japan and China teas, which are pushed in the upper provinces through British Columbia. Around Montreal and Quebec a great deal of coffee is drunk, there being so many people of French descent in that district. The consumption of Ceylon tea is increasing very considerably in the lower provinces. Generally speaking, Ceylon tea is used alone, and they go in for the lower grades. Their taste is changing, however, and he thinks that in time they will prefer medium grades. They like leafy teas best, such as Pekoes and Pekoe Souchongs. The traders are very reluctant to let Ceylon become popular amongst the people, considering that the profits on China and Japan are greater than on Ceylon. The idea is that one pound of Indian tea displaces two and a half pounds of China and Japan tea, as it goes so much further, and so here the trade suffered a loss.

While on this subject, we may remark that Mr. Wm. Dallas, of New York, has challenged a statement of the "Salada" Tea Company to which reference was made in our last issue He says that the statement that there is no system of bonded warehouses in the United States and that, consequently, American importers have had to store teas in Canada, is 'a gross misstatement of fact.' Up to the time teas were declared free by the United States Government, there was, he states, a perfect system of bonded warehouses at all ports of entry in the United States, and this system still continues, as there is a large import to the United States of dutiable goods, which, on arrival, is entered in bond and held in bond until the importers desire to pay the duty. When the duty was imposed last June, and up to date, the United States tea importers had the same privilege as other importers of dutiable goods. They can either pay duty on arrival or warehouse in bond and withdraw the teas by paying the duty as desired, and they are not compelled to pay the duty on the entire lot, but in quantities to suit their sale.

THE SELANGOR PLANTERS' ASSOCIATION.

Extracts from the 6th Annual report of this Association appear in our present issue. They show that in the matter of coffee prices the S. P. A. has arrived at much the same conclusion as the coffee planters of South India have lately given practical effect to. The report says:—"the lower price which our coffee has been fetching, without, as far as we have been able to ascertain, any appreciable corresponding advantage to the consumer, has naturally led planters to consider the possibility of supplying the public with the prepared article 'direct from the plantations' and appropriating to themselves some of the profits of the middleman." If we mistake not, it was, indirectly, on the initiative of a member of the Selangor Planters' Association that action was taken in South India, though the object of the new movement here is not so much to appropriate some of the profits of the middleman, as to stimulate the consumption of coffee. Another section of the Selangor report deserves to be specially noted. Every word of the following should be well weighed by local planters:—"The maintenance of a high standard of excellence, combined with the greatest economy in production, are questions of vital importance if the coffee industry in this country is to successfully battle with the present crisis, and, realizing the necessity for a much closer acquaintance than you now have with the position of affairs in the Brazils, the crops from which country exercise so omnipotent an influence upon the markets of the world, your Committee propose to make immediate arrangements for the supply of regular and reliable information as to the prospects of the coffee enterprize in that country." We can but say, "Hear, hear."

OUR READERS' WISHES.

We issued blank post-cards to our readers, and received back a sufficient number to enable us to gauge the desires of the majority. The ballot resulted in a strong preference being given to our "Group A," the "order of merit" working out as follows:—

1. Practical papers on Planting.
2. Season and crop reports.
3. Scientific papers on Planting.
4. Correspondence.
5. Statistics, Market Reports.

As regards 'Group B,' short and serial stories and a section for ladies received hardly any support. "District affairs" found favor with a few, and Sporting with others, while some of our subscribers wrote very emphatically saying that these matters should not be within the scope of a planting journal. Sporting, it may be remarked, could only be properly treated if considerable expense were incurred. Reprints or paraphrases from the dailies would be useless; special reports, to be accurate and interesting,

would involve heavy expense, and this could only be met by an enhancement of the rate of subscription. Seeing that the voters for "sporting" are in a minority and that this matter really is beyond the range of *Planting Opinion*, we have decided not to touch it. District affairs will be taken in hand whenever reliable correspondents favor us with letters on the subject.

It is appropriate to mention here that we have arranged with a very well known South Indian planter to write for us a special series of papers treating of

Tea, from seed to cup.

We do not say that this is the title the papers will bear, but an attempt is to be made to give practical hints that would serve the beginner and enable him to take tea cultivation and manufacture in hand with the teachings of experience before him. It is hoped that when the details of cultivation and manufacture are touched upon, experienced planters will review and criticise and submit notes for comparison, so that a really useful record of Tea planting and manufacture in Southern India may be evolved. This is a matter in regard to which it will pay planters to be liberal. From one point of view it may seem as if we are asking men to assist in teaching men who are, or will be, their competitors. From another standpoint, it will be seen that anything that tends, directly or indirectly, to improve the quality, and thus to enhance the reputation, of South Indian teas will in the long run confer a benefit on all tea-planters in these parts. The strength of the planting community will always lie in union and co-operation.

PRIZE ESSAY.

THE LABOUR QUESTION.

The Past, Present, and Future Supply of Labour in the Wynaad.

THE PAST.

Whatever differences of opinion may obtain amongst the Planting community in Wynaad with reference to general questions relating to various branches of the Planting industry, absolutely none exist as to the paramount importance of a regular and sufficient labour supply upon coffee and tea estates, more especially on the latter, where any deficiency in this respect, would entail irreparable loss.

During the past fifty years, the conditions of the labour market have undergone various modifications in the Wynaad District.

From 1848—1858, but few estates were opened, these were generally scattered apart. roads, and communications were imperfect or non-existent, there were no local grain markets, hospitals or dispensaries, and but few Europeans had settled in the taluq, while the lands cleared for coffee plantations consisted almost entirely of blocks of heavy forest, in close proximity to the edges of the ghat range, or in the vicinity of the various passes connecting the tracks leading from the adjacent low country in Malabar, into the contiguous Mysore Province.

In the early half of this decade, the class of labour available for all the pioneer, as well as for the bulk of the other, work on estates, was mainly local, and consisted of the jungle tribes, or hill men, forming the aboriginal inhabitants of the plateau; known as Kooroombers, Kooreehas, Kardars, Moopers, Naikers, and Painers, with a sprinkling of Moplahs, from the low country: these people usually lived near, but not upon, an estate, while—more particularly during the latter half—Mysore-Canarese who were housed on the properties where they were employed, contributed their contingent to each estate's labour supply.

The style of culture on coffee estates up to the end of the Fifties, was less elaborate than at the present date, and excepting during the planting and crop picking months, the numerical strength of the labour employed on coffee estates was, relatively, far below the number which is deemed necessary to cultivate on modern lines.

As a rule, the "Hill men" were paid weekly, care being taken to conciliate them as much as possible by presents of tobacco, salt, &c., with an occasional sheep on high days and holidays; the daily wages then in vogue being two annas per man, and one and a half annas per woman for all classes, and, excepting in the cases of Canarese, advances to recruit such labour were not essential.

But about the year 1856 the daily wages paid to all labourers was increased to four and two and a half annas respectively.

With the rapid extension of the coffee industry, towards the close of "the Fifties", it became necessary in order to meet estate requirements, to enlist much larger gangs of Canarese from Mysore as well as Tamils from Coimbatore and Salem, together with "Coast labour"—comprising Cherumas, Kanakas, Nairs and Tiers, from Malabar; the Canarese having always shown a greater aptitude for ordinary estate work than the "Hill men", Tamils or "Coast labourers" the rates of daily pay earned by each class being identical, *viz.*, 4 as. by men and 2½ to 3 as. by women—and such was the condition of the labour market up to the year 1875. As was natural, with the increased demand for Mysore labour, the Canarese cooly acquired a sense of his own importance, and maistries and Kanganis who had for years previously recruited sufficient of such labour with a comparatively low advance (under a contract) without much trouble, realized that it had become a growing difficulty to fill up their gangs, unless by offering higher inducements to coolies than heretofore. It should be here noted that a Canarese maistry was usually an individual of superior intelligence, influence and physique to the average run of cooly, and when these traits were associated with honesty towards his employers such a character in time worked himself into the lucrative and responsible position of "Head maistry" upon an estate, carrying an emolument of from Rs.30 to Rs.80 per mensem.

Synchronizing with these changes, it became apparent that the Labour Contract Law known as Act XIII. of 1859, which had been framed more especially to define the respective status of employers and employees, and to guard against loss to the former from unscrupulous action by the latter, was practically inoperative both in its general scope, and in the manner in which the various tribunals before whom prosecutions were launched within its provisions interpreted their powers: hence dishonest maistries and coolies gradually become aware of the impunity with which they could ignore their engagements, and this unsatisfactory condition of the law has aggravated the evil referred to, year by year.

At about this period, *viz* in 1875, Messrs. Parry & Co. made an effort to introduce fresh blocks into the Wynaad

Labour Market from the East Coast, but though the experiment, under the *ægis* of the late E. S. S. Thompson. of Vellara Mulla, was given a full and fair trial, it proved a complete failure—for the reason already adduced.

In the years 1876-77 the Mysore Province was devastated by Famine, during which it has been computed on competent authority that upwards of three-quarters of a million of the population perished—with, as a result, a serious decline in the proportion of able-bodied labourers heretofore available for engagement on coffee estates—though for a few months (during the famine crisis) the supply of Canarese in the district was unprecentedly large.

Mysore is now assumed to have repaired the population lost 20 years ago, and with recurring seasons of prosperity the Mysore ryot cooly has acquired property, and grown, comparatively speaking, independent of the savings he formerly found it necessary to accumulate (upon coffee or tea estates) in order to meet payment of his land tax (Kandya), the purchase of seed grain, ploughing cattle, and so forth; with the result that whereas he formerly came in for work on Estates in May or June, and remained till the end of the ensuing March, he is now difficult to allure away from his village, except under much higher inducements as to advance—than formerly (amounting now-a-days to as much as Rs.20 per cooly), and even then he remains a much shorter time on an estate.

Fortunately, an ample supply of *Tamil* labour has been attracted to the district, and though this class of labourer is distinctly inferior to Canarese the Tamil works with tolerable regularity from June to February, under similar conditions and for the same wages as the Canarese, the recruiting maistry being usually paid 10% commission on the gross earnings of his gang, while cooly contracts are entered into under far more reasonable advances than was practicable with Mysore labour.

Within the past 3 years the scale of Canarese maistries' pay has on some estates been increased from 10 to 15% in the belief that with such additional commission these men will be induced to enlist large gangs of Mysore coolies.

The supply of low country or coast labour, has also largely increased during the past 20 years, no difficulty having been hitherto experienced in recruiting labourers of this class, under much lower advances than has been the practice with either Mysore or Tamil coolies. The drawback associated with such people is, their disinclination or inability to remain on estates above the ghats for more than a few weeks at a stretch, the ostensible excuse pleaded being, that they are under permanent engagements to serve their landlords in the low country; hence a condition bordering on slavery obtains with the bulk of these labourers, and until Government introduces an Act, abolishing such servitude in Malabar, these drawbacks will continue to handicap planters.

It may be held therefore, that during the past 40 years the scale of daily wages paid in Wynaad, to all the classes of labour on estates, has undergone no material alteration.

The Present.

The present position of the Labour Question in Wynaad may be summarized as follows: The best class of labourer, is the *Canarese* cooly; he is, however, more difficult to recruit than formerly, and works for a shorter time than he used to do—his daily wages having undergone no alteration for many years—though that of his maistry has, in some instances, been raised from a monthly commission of ten to fifteen per cent.—He is moreover well housed, provided with medical attendance when sick, and furnished with a weekly subsistence allowance of 8 as. as also with a woollen cumbly in the S. West monsoons, his pay account being liquidated at regular intervals.

The *Tamils* on most estates outnumber the Canarese: they are, however, as already specified less efficient as labourers, but are treated in all essential details on a par with Canarese—except that the recruiting maistry decrees a more reasonable advance on executing his labour contract, as he is able to enlist his labour at from 3 to 5 Rs. per head, he himself being remunerated with 10% commission on the gross monthly earnings of his gang.

Coast labour contractors recruit their gangs with, as a rule, an advance not exceeding Re.1 to Rs.2 per head; they either execute agreements to find labour for employment on daily wages at 4 as. per man or they undertake contracts for the accomplishment of piece work, at special rates. Under the former arrangement, the coolies are paid up weekly, the contractor receiving 10% commission; while under the latter, the account is settled up on termination of the contract undertaken.

Locals or *Hillmen*—work irregularly—rarely putting in an appearance on more than 3 days in each week. They usually live at some distance from estates, apply for employment without an advance, and are paid the same rates of daily wages as other labour, their balances being liquidated weekly; this class are especially expert in executing temporary buildings, in the manufacture of baskets and in felling and clearing jungle.

With the close of the year 1898 therefore, the labour available in the district may be deemed to be amply sufficient to meet all existing demands on estates hitherto developed and under cultivation.

The Future.

During the ensuing quinquennium, the existing area under Coffee and Tea, more especially the latter, will probably be largely increased, and the problem confronting investors, irrespective of the "Currency Question"—the future of exchange—and the financial position of both staples in the Home markets, is, how the increasing demands for labour can be successfully met.

In the judgment of those in the best position to form a sound opinion on these subjects, the most important essentials to enable the Wynaad planting community to conduct their enterprize successfully in the near future are:—i. An improved *Labour Ordinance*—facilitating the prosecution and punishment of defaulting maistries and coolies. ii. An Act for the abolition of slavery in Malabar. iii. The completion of, and thorough maintenance in good repair, of all the existing main lines of roads leading into and through the taluq. iv. Absolute unanimity amongst the planters to abstain from raising the current daily scale of wages, to all classes of labour.

Given these desiderata, the future uncertainty connected with the labour difficulty, would be minimized, and the popularity of the district enhanced, not merely as the most accessible, salubrious and picturesque hill plateau in

South India, but as the most profitable tea and coffee district in the tropics.

(Signed) W. V. HUDDLESTON,

December 17th, 1898. *Kalpatty, S. Wynaad.*

APPENDIX.

Authorities from which the opinions and facts quoted in this Essay were collected;—

1. The Mysore Census Report of 1891.
2. Information given to the author, by the late Herbert Richardson. Deputy Collector of Wynaad in 1864, and for some years following,
3. Do. do. do. from the late James Gordon, a leading Ceylon Planter, from 1848—1858, and in S. India, from 1858—78.
4. The writer's own experiences of the district, and of the Mysore labour districts, during an unbroken residence of nearly 34½ years.

THE HON. MR. J. D. REES ON EXTRADITION.

We are glad to learn that the Hon. Mr. J. D. Rees has spoken boldly in favor of Extradition, or some arrangement of the like nature, in behalf of the planters of the South. At the meeting of the Imperial Legislative Council on Monday, during the debate on the Financial Statement, Mr. Rees remarked :—

Your Excellency has already stated how important you deem it that European capital should be attracted to this country. I venture to say that if the Government of India can see its way to allowing extradition or making some arrangement of the like nature between the Madras Government and the neighbouring Protected States in regard to breach of contract, a useful step in that direction will have been taken. Since I endeavoured in vain to bring this about when the Extradition Act was under amendment in 1896, the planters have been proved by the publication of the report of the South India Planters' Enquiry Committee to be, as down South we all knew them to be, just and generous employers of labour, and they really suffer undeserved and, in some localities, not inconsiderable loss under the existing law. Whether or not the far greater loss they suffer from the appreciation of silver is merely temporary, this loss at least is constant and preventible. The planters are confident that they, like other producers, will receive the sympathetic attention of Your Excellency's Government.

This is a very clear, concise, statement, and should do a good deal to help planters to secure an amendment of the law on the lines of justice.

NOTES.

Wanted—Tea that will keep. Both Russian and Canadian buyers refer to Ceylon tea as not keeping well. In this respect there is something to be learnt from Japanese methods of manufacture.

Japanese Coffee in futuro. The Governor of the Loochoo Islands wishes to learn all about coffee cultivation, as the shrub already grows on one of the Islands.

Para Rubber Statistics.

Entries of rubber at Pará during the month of January ...	2,980	tons.
Shipments do for Pará do ...	2,698	,,
Value of ditto ...	£ 917.300	
Stock on 1st February ...	995	,,

They do these things better in France. As long ago as 1879 a law was passed in France rendering instruction in agriculture compulsory in all training schools for teachers. The teaching of agriculture became compulsory in the primary schools of all rural commerce in 1882.

Coffee According to Messrs. G. Duuring and Zoon, the stocks at the European ports on the 1st March shewed a decrease of 3,800 tons, and the visible supply a decrease of 3,800 tons, being estimated respectively at 222,600 tons and 386,080 tons against 226,400 tons and 388,270 tons on the 1st February.

Tea in Germany. It is reported that tea is making steady progress amongst the mass of the people in Germany, especially towards the North. "Where you approach the sea coast," says Mr. James Ryan, "and the boundary of Russia and Austria in Germany, there you find that the consumption of Ceylon tea is increasing."

Tea for Russia. It is rumoured that the Russian Government has under consideration an increase of the tax on caravan tea. Ceylon tea is said to be used in Russia for blending alone Darjeeling teas are liked because of their soft flavour. The grades of tea in most demand are cheap and medium sorts, from 6d to 8d.—not a large leaf.

The London Tea Market. Cabling to Colombo on the 23rd ult. Messrs. Gow, Wilson and Stanton reported a steady market, with Pekoes for price dearer. Average 8¾d. (¼d. up), price of Pekoe Souchong ½d. (¼d. up). Reuter quoted 8⅞, average (⅛d. up) and said that 20,000 packages Ceylon had been sold out of 21,000 offered; 28,000 Indian out of 31,000 offered.

Pepper. *The London Commercial Record* of 10th ultimo says :—"Pepper has once more assumed its waiting and watching policy, so irritating and discouraging to holders and bull operators. The downward tendency of black Singapore has cast a gloom over the whole Pepper market; business has practically come to a standstill, but it is generally accepted that the statistical position of Pepper will shortly reassert itself."

The Manuring of Tea. Mr. John Hughes writes from London to the *Ceylon Observer* that, in common with many others, he is looking out for some report from Mr. Bamber in reference to an improved manufacture of tea or a new system of manuring. To Mr. Hughes's mind judicious manuring is specially important, because with poor leaf it must be impossible to make good tea; but good leaf may be spoilt in the manufacture. He has been very busy with soil analyses lately and states that much more manure is being sent out from England than formerly.

Tea Statistics. We are glad to see the *Planter* commenting on the unreliability of the statistics at present supplied regarding the area and outturn of tea in India. Our contemporary gives a comparative table of area of tea throughout India in 1897 (under mature and immature plants, which shows the following widely different figures :—

Statistical Ddeartment	...	493	710¾.
Indian Tea Association	...	389	319.
"Home and Colonial Mail"	...	477	491½.

Surely when "½" and "¾" are entered so carefully we might expect some approach to accuracy ?

The Canadian Tea Market. The *Canadian Grocer* of 24th February states :—"There appears to be quite a scarcity of cheap China black teas for a price on the Canadian market. The scarcity is particularly pronounced in the Eastern Provinces, and Toronto has been pretty well cleaned out of these teas for shipment to Montreal. As a result, there has been quite an appreciation in prices, teas that were selling at 8½c. being now held at 10½ to 11c. in Montreal. A scarcity also prevails in Japan teas at 12½c. per lb. downward. There has been quite a little buying in both Toronto and Montreal of Japan tea dust. It is presumed that it is on speculative account."

Tea in Austria, &c. Mr. James Ryan, of Ceylon, who has lately returned from Europe, states that though nothing official has been said in Austria it is understood that the Imperial authorities are sympathetically considering the proposal to reduce the tea duty by nearly 50 per cent., as recommended, and are disposed to grant it. As to other parts of the continent, Mr. Ryan found tea, and Ceylon tea was being talked about everywhere. In Roumania, for example, tea was obtainable in all the restaurants—tea of a very good quality, too. The drawback was that it was invariably called *thee von China*, irrespective of whether it was a blend or even entirely British-grown. In spite of such drawbacks, there was no doubt that Ceylon tea was rapidly passing into consumption in Europe, and the markets of the continent were most promising.

The Adulteration of Food and Drugs. Section 12 of the new English Bill reads as follows :—

12. The label referred to in section eight of the Sale of Food and Drugs Act, 1875, shall not be deemed to be distinctly and legibly written or printed within the meaning of that section unless it is so written or printed that the notice of mixture given by the label is not obscured. Provided that nothing in this enactment shall hinder or affect the use of any registered trade mark, or of any label which has been continuously in use for at least seven years before the commencement of this Act; but the Comptroller-General of Patents, Designs, and Trade Marks shall not register any trade mark purporting to describe a mixture unless it complies with the requirements of this enactment.

As the *Grocer* observes :—This practically leaves the labelling of mixtures where it is, except that a written or printed notice must not be obscured, and that in future no trade mark can be registered unless it complies with this section; but those of seven years' standing at the passing of the Act will be allowed to remain as they are.

A Contrast. In the Report on the working of the Department of Land Records and Agriculture in the Province of Coorg for 1897-98, we read :—"The comparative value of the coffee crop during the year, made the planters very desirous for an enquiry into the cultivation and the causes of 'borer' and 'leaf diseases' by a Scientific Expert; and should Government send one to this province temporarily, he will be eagerly welcomed by the planting community." The Government referred to is that yclept "India." Yet to the *Mysore* Government is due the fact that the want referred to has been met, and the report of the expert selected actually issued *before the want was officially recorded in the above annual report* relating to the province concerned. No blame attaches to the sympathetic Commissioner of Coorg, of course, but the contrast between the enterprise of the Mysore Durbar and the sluggishness of "India" is very marked.

Ceylon's Present to the German Emperor. Mr. James Ryan, Ceylon's representative in this matter, has returned to the island, and briefly described what occurred at the now historical interview. Mr. Ryan was very much pleased with the interview, as His Imperial Majesty took some little trouble to see him. The Kaiser arrived from Kiel on Saturday night, but notwithstanding this, knowing that Mr Ryan wished to leave next day for Ceylon, granted him an audience on the Sunday morning at the Imperial Palace at Berlin. The presents were forwarded beforehand and Mr. Ryan was ushered into an anteroom, and on the arrival of the Emperor and Empress he was introduced by an aide de-camp into the imperial presence, the only other person who was in the room being the Chamberlain. The conversation, which was conducted in English, lasted between ten minutes and a quarter of an hour, and Their Majesties appeared to be interested; but Mr. Ryan does not feel at liberty to disclose what took place, as he has to report to the 'Thirty Committee,' and probably not all that occurred will be made public.

Colombo Tea Sales. The *Times of Ceylon* reports that there was a fair supply and good demand for all grades at the last tea sale. The higher grades of tea were well competed for, and leafy teas (pekoes and pekoe souchongs, were in good demand, with an increase in some cases of from one to two cents. Broken pekoes were firm, but dusts were slightly easier than last week. The drought up-country is having some effect upon the supply, which will probably be less and less each week till there is a fall of rain. Our contemporary's sale correspondent reports as follows :—At to-day's public sale of tea at the Chamber of Commerce Rooms about 10,767 pkgs. = 872,043 lbs.

were offered, of which about 8,870 pkgs. = 725,243 lbs. were sold. The sale passed off with good competition at firm rates for all kinds. Pekoes and Pekoe Souchongs of all descriptions were in strong demand at about previous rates. Broken Pekoes were rather irregular. The finest teas in the sale were:—Devonford, Middleton, High Forest, Naseby, Glasgow and Mocha. In the low-grown teas, good invoices were offered from:—Perth, Eila, Glencorse, Chesterford, Arapolakande. Vogan, Pallagodda, and Razeen.

Mexican Coffee. In an interview with a representative of a Colombo paper, Mr. R. G. Pineo stated in regard to Mexican coffee, "I was not at all satisfied with the conditions, and did not think them favourable to coffee cultivation, because of the uncertainty of labour and the lowness of prices then prevailing for coffee. The people did not care much for work, and if you got them to work there was no way of keeping them, as they were in no way under control. One might get up in the morning and find that all his labourers had disappeared. I did not go in for coffee there. I saw it was in the same condition as it was here. It was of an almost uncultivated and practically wild growth." He also attended to Mexican coffee as "rank stuff, more like Brazil coffee than anything else." Whatever the coffee may be, this kind of talk is "wild" enough. Seeing that Brazilian coffee rules the markets of the world, it is nonsense to classify it as "rank stuff," and as for Mexican coffee the conditions of cultivation in that country are so varied that it is impossible to treat all the product as of one quality. We have samples of Mexican coffee in the parchment and cured, and while we certainly prefer best Coorg, we should not term the samples either "rank" or "stuff" or even "rank stuff."

Java Quinine. A meeting of the shareholders of the Java Bandoeng Quinine-works was held on January 23, Baron van Heeckeren (director of the company) occupying the chair. The first point of the agenda, the election of a director, was quickly disposed of, after which the terms of dismissal of Mr. H. J. Van Prehn were considered. Until December 14 last the management of the company had been vested in Mr. Van Prehn, as technical director, jointly with the commercial director, Baron von Heeckeren, but on that date, at a general meeting, Mr. Van Prehn was removed and the office of technical director abolished. A committee of shareholders was appointed to report on the subject, and it was now proposed—

1. That the dismissal of Mr. Van Prehn should take effect from December 14 last.
2. That the conditions of his dismissal should be definitely settled only after the balance-sheet had been dealt with.

The articles of association required alteration in accordance with the committee's report, and after an amendment increasing the maximum number of directors on the board from four to five had been adopted the whole proposal was carried unanimously. As, however, pending the approval of the alteration of the articles of association by the Government, the office of technical director, vacated by Mr. Van Prehn, had to be filled temporarily, the meeting appointed to this post Mr. Smit Sybinga, who had acted since Mr. Van Prehn's removal.

A new Tea Company. The Abbotsleigh Tea Company (1899), Ltd., was Registered in London on February 24th, by Ingram and Co., 67, Lincoln's-inn-fields, with a capital of £50,000 in £10 shares. Object, to adopt and carry into effect an agreement expressed to be made between G. Pargiter Fuller and N. Rowsell of the one part and this Company of the other part for the purchase of the estates and assets in Ceylon of the Abbotsleigh Tea Estate Company, Limited, to develop and extend the same, and generally to carry on in the island of Ceylon, or elsewhere, the business of tea planters or growers of tea, coffee, cinchona, or other vegetable products, &c., to acquire, for the purposes of the Company, and turn to account any buildings, livestock, easements, rights, privileges, works, machinery, plant, and other property, real or personal.

LETTERS TO THE EDITOR.

"CHEESY TEAS."

SIR,—*Re* "Cheesy tea" packages, myself in common with others have been a sufferer through purchasing local packages this season, and the appended extract from Messrs. Sanderson & Co.'s report on one lot of same may perhaps serve to induce the principle manufacturers at Cochin, Quilon, and other large tea-chest manufacturing centres, to take steps to prevent the evil—which if it continues will kill their business. Even now I have been importing Japan packages from Ceylon rather than run the risk of further loss from the cheesiness complained of.

The remedy, I believe, is simple, *viz.*, to erect a "kiln" and thoroughly kiln dry the wood after seasoning and before making into shooks.

Some twelve years ago I was in Japan and while there inspected the chest manufactory of Messrs. Fraser, Farley & Varnum, and I was the first to initiate the importation of Japan-made chests to Ceylon and India. In the former country three-fourths probably of the tea shipped is sent home in these packages, and in India the trade is considerable, and such a complaint as cheesiness is, I believe, unknown. Now all these "Japan" packages are kiln dried with special kilns erected for the purpose. At the same time I am bound to say that packages I have seen and used turned out in Cochin and Quilon compare favorably with the Japanese article in strength and neatness and have a fairly equal tare and are considerably cheaper. If then our chest manufacturers would start *kilns* and advertise that they guaranteed their packages kiln dried, there would be no need to go further afield.

At present my experience is that if one tells a manufacturer his packages are "cheesy" he looks on it as an insult and probably explains it as carelessness of the superintendent or that the packages have got wet. I hold myself the latter is a bad argument in this country of long transits by cart and boat and bad facilities for shipping, as if it is true that on the wood being slightly wetted on the outside the package will give out the cheesy smell complained of, the sooner we go for Japanese or some of the other patent chests the better. In Japan there being no patent laws all special machinery is, or was, jealously

guarded, and I did not therefore see the apparatus used; but I believe they are common enough in America and Norway.

H. DRUMMOND DEANE.

Stagbrook, Peermaad,
Travancore.

[Inclosure].

Extract from Messrs. Sanderson & Co.'s report, 25th Nov. 1898.

"*Re* "Stagbrook" Or. Pekoe—we offered this tea again yesterday "in Public sale and the market would not bid for it at all. On in- "specting it to-day the taint is clearly more noticeable than it was "a month ago, and the smell of the wood used in making the chest "is more pronounced—in our opinion the wood used could not "have been properly seasoned and it appears to us that the wood "is still drying and this produces the 'cheesy' taint complained "of; the tea if untainted would have realized ½*d* per lb. more."

GENERAL ARTICLES.

CEYLON PLANTERS IN THE WYNAAD.

The *Times of Ceylon* says:—

As our readers know, there have been many Ceylon men who, in the course of the last seven or eight years, have turned their attention to the Wynaad as a planting country, and we have been at some pains to get the following account of their work and welfare. The notes are from the Wynaad itself, and we think will be found interesting:—

Mr. J. S. Nicolls was, I believe,

THE FIRST CEYLON TEA PLANTER WHO REACHED SOUTH WYNAAD.

and his appointment to the Errawacullee estate, Mappady, was quickly followed by the teas shipped home from that property realising most satisfactory prices in the London market. For some considerable period after Mr. Nicolls took charge of the Errawacullee factory, teas from other estates were sent to Errawacullee for treatment, as from its central position this factory offered special advantages for the preparation of their produce, the Chulika and Kanombyle gardens having their leaf prepared under Mr. Nicolls' auspices. During the year 1896 these teas all averaged over 10d. per pound, and an excellent system was inaugurated. Shortly after taking up the appointment referred to, Mr. Nicolls invested in the Poothacoollee property at Meppady. Poothacoollee consists of

A FINE BLOCK OF OVER 400 ACRES

of land, having a wide frontage in the hamlet of Mappady itself, nearly half the tenements in Mappady being situated within the estate boundaries, which also enjoys the further advantages of being traversed by the Government high road, connecting Calicut with the Nilgiri district, while about half a mile from Mappady, the Government travellers' bungalow, church, reading-room and club, —attached to which latter are several excellent lawn tennis courts —all stand within the confines of the property and enhance its value. The greater portion of Poothacoollee estate was originally under Arabica coffee; but Mr. Nicolls has devoted his attention to

THE ESTABLISHMENT OF TEA

on his holding, and a considerable area has been opened with the latter. Irrespective of his reputation as a first-class tea-maker, Mr. Nicolls excels both at lawn tennis and cricket, and is exceedingly popular in the district. About two years ago the subject of these notes resigned the management of Errawacullee, and took up the supervision of a tea estate in the Nilgiri district; but in 1898 he returned to South Wynaad, and assumed charge of the Wynaad Tea Company's new factory at Perrengodda, Vayitri, which was then being completed. The teas from the Company's garden have already

AVERAGED OVER 8D.,

and as the factory has been equipped with the most recent up-to-date machinery, and is calculated for curing 250,000 lbs. of tea per annum, there can be little doubt that its produce will have the best possible treatment while under the present superintendent's control. In the early half of the year 1896 Mr. Nicolls married a daughter of Mr. J. R. Malcolm, of Vellera Mulla estate, South Wynaad, and he now resides at Colloor estate, South Wynaad.

Mr. A. L. Glennie succeeded Mr. Nicolls at Errawacullee, and the teas shipped home from that factory maintain their favourable reputation. Mr. Glennie's address is Errawacullee, Mappady.

Mr. E. de Fonblanque is so well known as your champion lawn tennis player that his friends will be peculiarly interested at learning something of his movements in this district. Mr. de Fonblanque purchased the Perrindotty tea estate from Messrs. Parry and Co., Madras, in 1896, and since he settled in Wynaad, he has made that property his headquarters. Perrindotty was the first garden opened in the district, and the first factory erected in Wynaad was on this property. The block is nearly

800 ACRES IN EXTENT

about one-third, or rather more, being now under tea; and it enjoy various advantages, water-power being available at the factory, while the Government high roads leading from Calicut to the Nilgiri district, as well as from Choondale to Suitan's Battery and Mysore, either traverse or skirt the holding, which has moreover always been popular with Canarese, Tamil, and Coast labour, the well-stocked grain markets of Kalpatty and Vayiter on the east and west being within two or three miles In addition to Perrindotty, Mr. de Fonblanque, about two years ago, purchased

THE NELLANOOR ARABICA AND LIBERIAN ESTATES,

situated three-and-a-half miles from and east of Mappady. This estate contains some of the finest Liberian in Wynaad. It is over 300 acres in extent, about one-third being under cultivation; and the first Liberian-Arabica coffee hybrid discovered in Wynaad was upon Nellanoor. As this original hybrid coffee tree is considered, by those most competent to judge, to be one of if not the finest tree of the species in the district, it being doubtful whether any other original hybrid anywhere in South India is comparable with it, the following details connected with its history should prove interesting. The tree was first observed in a nursery of Liberian seedlings on Nellanoor nine years ago, the nursery having been sown with seed gathered off Liberian trees growing upon the Anda Tode estate, Vayiter, these Liberians having been planted 10 feet apart in Arabica coffee about the year 1882. The hybrid under reference so far outstripped the Liberian seedlings in the same beds that especial care was bestowed upon it, and in due course the young tree was put upon the estate amongst the Arabica and Liberians.

Up to date of the acquisition of the property by present owner, this hybrid tree has yielded the following crops of parchment seed:—

In 1893 when	2½	years old,	¼	of a seer sound parchment.	
„ 1894	„ 3½	„	„ 3	seers	„
„ 1895	„ 4½	„	„ 8	„	„
„ 1896	„ 5½	„	„ 4½	„	„

or 15¾ seers for the 4 years. Eliminating the virgin crop, the yield for the last three years, particularized above, aggregated 15½ seers, or upwards of 5 seers per annum average! Liberian-Arabica hybrids should be planted 8 × 8 wide, at which distance there are 680 trees in each acre approximately, so that a yield of 5 seers per tree (there being 28 of such seers in a cut standard bushel) works out to over 121 bushels parchment per acre, or say 1¼ tons. In calculating the probable value of similar hybrids, the fact should be borne in mind that the crop gathered from trees raised from the seed of the original hybrids consists entirely of A. and P. B., and that the cherry is as easily treated in an ordinary Walker's disc pulper as that of Arabica cherry. There can be little doubt but that, under a system of careful selection of the progeny of this original hybrid,

A GREAT FUTURE

awaits the lucky owners of the first hybrid coffee estates in Wynaad opened with such seed. Mr. de Fonblanque has already planted 20 acres with his hybrids upon Nellanoor. Messrs. Parry and Co. have opened a hybrid coffee estate in their magnificent Vellera Mulla forest land; while the owner has also planted 12 acres with the same variety of coffee upon a block of 250 acres of land he has acquired adjacent to Perrindotty. Mr. de Fonblanque is now interested in over 1,300 acres of land in Wynaad and that his hand has not "lost its cunning" upon the tennis court was marked a few weeks ago by his winning the Open Singles Handicap, from the—40 mark!

MR. STEWART ROBINSON

first settled about 2½ years since on the York estate at Vellera Mulla, the property of Messrs. Parry and Co., which had been planted entirely with Liberian, protected by silver oak as a shade. But after

a time Mr. Robinson relinquished York, and acquired a fine block of land from the same firm at Kalpatty, where he has opened both coffee, arabica, and tea, the former upon virgin forest, the latter upon a tract which, thirty years ago, was covered with very fine coffee (having been originally bamboo land). Both clearings have been most successful up to date; and as Mr. Robinson resides upon his own property, it receives the best possible treatment. His address is "Elton, Kalpatty, South Wynaad."

MR. W. Q. WRIGHT

was, I believe, but a short time in Ceylon, and is related to Mr. Parry, of our island. He took up a fine block of forest from Messrs. Parry & Co., Madras, at Vellera Mulla, where he is opening for arabica coffee, his address being "Scutwel Rock, Vellera Mulla, South Wynaad."

MR. E. H. F. DAY,

after having for some time in charge of the tea factory upon Chulika garden, purchased the "Neli Munday" estate from the Wynaad Tea Company last year, and purposes substituting tea for the fine coffee hitherto cultivated there, as well as opening the reminder of the block in tea. At the commencement of this year, Mr. Day initiated an experiment which is likely to be watched with much interest in Wynaad and the adjoining Coorg and Nilgiri districts. Being impressed with the superiority of

"SINHALESE" LABOUR UPON A TEA ESTATE

over Canarese, Tamils, and Coast coolies, he has succeeded in introducing a gang of these people from Ceylon upon Neli Munda, one important advantage in connection with the Sinhalese, assuming that they fulfil their labour engagements satisfactorily, being that Mr. Day hopes to have them continuously employed on his property—a *sine quá non* upon a tea garden, though upon a coffee estate, during the hot weather, a diminished labour-supply is not fraught with the same loss and inconvenience. These Sinhalese have been recruited at a higher scale of daily wages than the other labour in the district.

The writer of these "notes" has always retained the pleasantest recollections of Ceylon men, and dates back his introduction to them to the late Messrs. A. C. Vertue and "Jack" Tyndall, the trio having been fellow-voyagers on the old P. & O. "Nubiani" May, 1864!

COCOA PLANTING IN SAMOA.

According to a British Foreign Office report, it appears that a potential commercial future has at length arisen for the Samoa group, after years of depression owing to the fall in price of copra, and the apparent unsuitability of the climate for other cultivations, such as rice, sugar, tea, or cotton.

Small capitalists ($2,500 to $10,000) going to Samoa and purchasing or leasing land for the purpose of cocoa planting, would stand a good chance of making a fair income after the first three or four years, provided they possess a practical knowledge of tropical planting or will take advice from those in Samoa who have experience in the matter. The number of small plantations is rapidly increasing, and it is estimated that 75 acres are now planted with cocoa trees. The tree is robust and hardy, growing luxuriantly in Samoa, and yielding abundant crops after trifling cultivation. The quality is considered good, the price varying, according to reports from Hamburg, San Francisco, and Sydney, between $290 and $390 per ton. A small plantation of 6 acres holds about 1,200 trees, and these in the third year produce some 140,000 pods; and it is apparent that even with the liberal allowance of 15 pods to the pound of marketable bean each tree would produce from 6 to 8 pounds of prepared cocoa bean per annum. The trees are in full yield after the fifth year, and there is apparently no age limit to their bearing.

The cost of land near Apia, continues the British consul, is from $7 to $14 per acre if purchased from whites, and from $1 to $2 per acre if leased from the natives on a twenty or forty years' lease. The soil is rocky and volcanic. Although labor in large masses is practically unobtainable and the native Samoan is by no means energetic, sufficient floating labor for small plantations is to be had. The price is from $6 to $8 per month. for a labourer, his food costing about $4 per month. One man ought to look after 6 acres of well-grown cocoa in the dry season, but two are required during the wet season-from December to May.

TEA, &c., COMPANIES.

The Putupaula Tea Estate Company, Ld.—At a meeting of the Directors of the Putupaula Tea Estate Company, Ld., it was resolved that an interim dividend at the rate of three per cent. per annum for the six months ending 31st December last be declared and paid forthwith.

Portmore Tea of Ceylon.—It is proposed to pay a final dividend of 7 per cent. (making 12 per cent. in all), which will absorb £2,800, and to carry forward a balance of £367. The yield of tea has been 241,635 lbs., being at the rate of 509 lbs. per acre. The cost of production has been £4,349, being at the rate 4·319d per pound, and the crop has netted £9,878, being 9·80d per pound, equal to a profit of 13·83 per cent. on the capital of the Company. The average rate of exchange for year has been 1s 4·5-64d, against 1s 3·29-64d during 1897. The estates, buildings, and machinery are stated to be in good order, and the estimates of crop and expenditure for the current year gives promise of continued satisfactory results.

Leesn River Tea Company, Limited.—Outturn and net prices of the past three years:—Outturn: 1896, 4,648 maunds; 1897, 4,358 maunds; 1898, 5,103 maunds. Not prices: 1896, 5a. 6p.; 1897, 5a; 1898, 4a. 6p. Estimate for 1899, 4,700 maunds. A satisfactory increase in the outturn is shown. The prices obtained are, however, disappointing. The acreage under cultivation is 738·92. The profit and loss account shows a balance (inclusive of £18 carried forward from last year) of £411, which the directors recommend should be carried forward.

Ankande Estate Company.—The general meeting of this Company was held on 24th ultimo at Colombo when the report was submitted and adopted. It stated:—Tea 175 acres, Cocoa and Liberian Coffee 106 acres, Cardamoms 96 acres, Jungle 232 acres. Total 609 acres.

The total crops harvested during the years were as follows:—

38,450 lb. Tea and 4,81[illegible] lb. Green Leaf
4,113 lb. Cardamoms
136,3·15 cwts. Cocoa

a small quantity of minor products (sold for R6,295)—the whole realising the nett sum of R24,519 85.

Interest on the loan of £1,500 stg. has been paid to 31st December last and depreciation on buildings at 10 per cent absorbing R344·21 has been written off It will be seen that the additions to capital account amount to R5,069·26, and the balance at credit of Profit and Loss it is proposed to carry forward.

The Glenury & Alwood Estates have fulfilled expectations, but the deficiency of crop of Ankande which gave lb. 69,987 of made tea during 1897, against lb. 38,450 for 1898 is much to be deplored. The Visiting Agent reports that the Estates promise well for 1899.

The Ceylon Tea and Cocoanut Estates Company, Limited. The Annual Meeting of the Shareholders of the above Company was held at Colombo on 18th instant, Mr. W. H. Figg in the Chair. The report stated:—Tea.—In partial bearing, 293 acres; (planted in 1895, 146 acres; and in 1896, 147 acres); not in bearing, 137 acres. Cocoanuts, 558 acres; Rubber, 35 acres; Grass, Forest and Chena, 213 acres; Cinnamon. 21 acres. Total 1,257 acres. The total crop of tea harvested in 1898 was 32,371 lbs., which realised a nett average price of 37·34 cts. per pound.

The Uvakellie Tea Company of Ceylon, Limited.—A General Meeting of this Company was held at Colombo on 20th instant. Mr. W. D. Gibbon presided. The report stated:—The amount of tea secured was 139,000 lbs. costing 30·83 cents per lb. against 29·89 cents per lb. for 1897. On the other hand the tea after estimating that still unsold at a low figure has realized 45·10 cents per lb as against 42¼ cents. for the previous year. In view of the low prices ruling for teas during the year just ended the Directors think the increase of price reflects a good deal of credit on the Superintendent. After writing off 7½ per cent. for depreciation on buildings and machinery the profit amounts to R17,251·41. Out of this an interim dividend of 3 per cent. was paid absorbing R7,200, leaving R10,051·41 to be dealt with. The Directors recommend that this amount be disposed of as follows:—That a final dividend be paid of 3 per cent. (making 6 per cent. for the year) absorbing R7,200; that a sum be carried to Reserve of R2,000; that a bonus be paid the Superintendent of R350; and that the balance of R501·41 be carried forward.—Total R10,051·41. The estimate for the current year is 144,000 lb. tea to cost R46,091·50.

The Kelani Tea Garden Co., Limited. The General Meeting of this Company was held at Colombo, on 20th instant, Mr. C. L. Davis presided. The report stated:—

282	Acres	Tea in full bearing
52	„	„ planted in 1896.
30	„	„ „ 1897.
34	„	„ „ 1898.
398		
179	„	Reserve
11	„	Ravines, Waste and Grass
158	„	New Purchase
746	Acres	

The crop secured amounted to 150,510 lbs. made tea, realizing R51,339·44, or an average price of cents 34·11 per lb., as against an expenditure, exclusive of item under Capital Account of R37,526·09, or an average cost of cents 24·93, including R2,644·74 spent on manure. The balance at credit of Profit and Loss Account, after allowing for depreciation on buildings and machinery, is R6,301·94. The Directors suggest that a dividend at the rate of 2 per cent. per annum be declared, absorbing R6,000, and that the balance R301·94 be carried forward to next account. The estimate for the current season is 185,000 lbs. made tea. A small return is expected from the 1896 clearing of 52 acres. The Directors propose during this season to open 10 acres to afford employment to the coolies during the dry months. The application of manure during the last two years has improved the constitution of the bushes, where applied, to an appreciable extent, but the abnormal weather during the last season, together with the attack of helopeltis, resulted in a short crop.

COFFEE IMPORTS IN THE UNITED STATES.

The *American Grocer* has the following interesting remarks:—with the point in the tail!—concerning imports of coffee into the United States:—

The last Treasury statement of imports, corrected to January 30, makes the total imports of coffee for the calendar year, 1898, compared with those for 1897 and 1896, as follows:

	Imports.	Value.	Cost per pound, Cents.
1898	804,250,988	$53,652,313	6.7
1897	806,048,539	75,687,676	9.4
1896	629,901,602	79,999,590	12 7

The above shows a decline in the average annual cost of imports of six cents per pound since 1896, and an enlarged consumption, which compares with 1897 and 1896, as follows:

	Pounds.
Imports, 1898	804,250,988
Exports, 1898	23,231,141
Net imports	781,019,847
Net imports, 1897	787,561,385
Net imports, 1896	621,429,664

The above shows a per capita consumption in 1898 of 10.7 pounds, against 10.9 pounds in 1897, and 8.7 pounds in 1896. Bringing the two years 1897-98 together, and taking the New York Coffee exchange record of stocks, we have the following exhibit of consumption:

	Pounds.
Stock, January 1, 1898 (917, 946 bags) ...	121,168,872
Imports, 1897 and 1898	1,568,581,232
Total supply two years	1,689,750,104
Less stock, January 1, 1899 (917,720 bags) ...	121,139.040
Consumption, two years	1,558,611,064
Average per year	784,305,532

This shows a very heavy increase, for there was no gain in stocks during 1898. Allowing for a shrinkage of 16 per cent. in roasting, we have an annual consumption of 658,816,647 pounds of roasted coffee, which, on a basis of two gallons of infusion to one pound of coffee, gives a total consumption of 1,317,633,294 gallons, which quantity exceeds the total consumption of beer and spirituous liquors by about 200,000,000 gallons. Coffee is the nation's favorite beverage.

The sources of supply are indicated by the following table:

	Pounds.
Brazil	607,842,784
Central America	36,110,939
Mexico	30,620,071
Venezuela and other South American countries ...	85.807,732
East Indies	17,781,307
West Indies	8,076,800
Germany	5,278,179
Other Asia and Oceanica	4,197,848
United Kingdom	2 921,752
Netherlands	2,234,736
Other Europe	1,306,014
France	599,523
Africa	67,977
Other countries	1,405,326
	804,250,988

Brazil furnishes 75.6 per cent. of the total; Mexico, Central America and all other South American countries and the West Indies, 20 per cent.; leaving 4 4 per cent. for all other countries. And yet Java and Mocha coffee are sold everywhere!

A WARNING TO TEA-PLANTERS.

An ex-Ceylon Resident writes from London to the *Ceylon Observer*:—

There are rumours current in Mincing Lane and its neighbourhood, that recommendations and orders from the big tea planting distributors (which is the new name for retailers) have gone out to pluck coarser, with the view of increasing the yield of common tea, whilst prices are high. You know very well that nothing could be more disastrous to the tea industry than for planters to increase the production in this way.

It is the falling-off of supplies to England, owing to the expansion of exports to other countries, that has caused the sudden change in the prospects of bewailing tea planters. The bug-bear of over-production has vanished, but it may soon be raised again if they carry out the advice given to them by the blenders and increase the exports artificially over the estimate. If they do so, they will lose all the benefits they derive from the sacrifices they have made and are making to increase consumption in other countries.

The recent advance in prices of common tea does not fall on consumers, but it seriously affects the pockets of the distributors who advertise the finest tea the world produces under cost price.

I need scarcely tell you that when the finer qualities advanced some time ago, distributors, who, owing to severe competition, cannot raise their prices, were forced to put less fine tea in their blends and more common. In this way they worked off the surplus stocks of the lower grades to such an extent as to lead them to think they might be cornered in them. They then rushed into the market and bought all that could be obtained at an advance of a penny per pound. Whether this advance is of long or short duration, depends upon the action of planters during the next two or three months, when the big flushes generally take place. If they send home a large increase in the quantity of pekoe souchongs, down will go the price to 5d per pound. If they tell their tempters to get behind them, there is a very fair prospect of the Ceylon tea industry having a good long innings of prosperity.

For the last few months I have been preaching to all who would listen to me, that the slap in the face the Indian and Ceylon tea planters got last year or two, was the best thing that could have happened for their permanent interests. It put a stop to the extensive increases in Indian planting at one time contemplated, and compelled planters, especially in Ceylon, to reduce the cost of production to the lowest point. They have been so far successful that at least three-fourths of the tea grown in Ceylon do not cost more than 25 cents per pound f. o. b. or at 16d exchange 4d per lb. With a considerable knowledge of the circumstances of every tea-producing country, I do not hesitate to say that no country in the world can produce tea below that figure. Therefore, in any future struggle for existence, it need not be Ceylon that will go to the wall, if the planters do not lose their heads.

SELANGOR PLANTERS' ASSOCIATION.

The following are Extracts from the Annual Report for 1898:—

Owing to various causes, extensions during the past year have not been upon the same scale as in previous seasons, to new members have, however, been enrolled upon the books of the Association and the attached statistics show an increase under cultivation of 1,676 but of labourers of all nationalities a decrease of 1,166.

Planting Products.—**Coffee.**—Whilst estimates have for the most part been realized and in some cases considerably exceeded, the depression in prices has continued throughout the year, except in the months of November and December, when, no doubt owing to short deliveries, the market hardened and as much a $25 per pikul was secured for the best No. 1; as soon, however, as the heavy pickings recommenced, values receded, and the year closed, as in 1897, with quotations in the neighbourhood of $19 per pikul, a price at which, except in very favoured localities, it becomes a difficult matter to do much more than cover expenses. A feature of this year's transactions has been the growing disinclination on the part of planters to sell their coffee in outside markets, the prices ruling in Singapore having compared very favourably with anything obtainable elsewhere. Your Committee think that a distinct improvement in quality has been effected during the year under review, and hope that no efforts will be spared, on the part of those who have stores, to turn out a sample which will hold its own with the best produced anywhere. The maintenance of a high standard of excellence, combined with the greatest economy in production, are questions of vital importance if the coffee industry in this country is to successfully battle with the present crisis, and realizing the necessity for a much closer acquaintance than you now have with the position of affairs in the Brazils, the crops from which country exercise so omnipotent an influence upon the markets of the world, your Committee propose to make immediate arrangements for the supply of regular and reliable information as to the prospects of the coffee enterprize in that country.

Para Rubber.—Probably no more important evidence, that planters are at last realizing the futility of risking their all on any one product, has been afforded during the past year than the energy with which large areas have been planted up with para rubber. Had it not been for the shipments of seed which were received from Ceylon, operations would have been considerably restricted, as the local supply was nothing like sufficient to meet the demand. The vitality of para seed is so dependent upon immediate planting that it was feared the long journey from Ceylon would prevent a large proportion of the seeds from germinating; happily, however where proper precautions were taken, from 50 to 60 per cent. of plants resulted on an average from the Ceylon seed, and in consequences this product, which does so well here, and which has to all appearance so prosperous a future before it, has become established in the State with every prospect of large extensions in the coming season. The young plants are reported on all sides to be growing satisfactorily, but on most places heavy losses have been occasionedby rats, lizards, mole crickets and other pests, and the problem now to be solved is, how to best stave off such attacks until the plants are able to take care of themselves. Your Committee, therefore, hope that members will communicate to the Association particulars of any experiments that have been attended with successful results. 389,500 ParaRubber trees have been planted in Selangor during1898.

Minor Products.—A considerable acreage has been brought under plantations on two estates in Klang, and it appears probable that far more attention will, in future, be paid to catch crops generally in conjunction with permanent products, than has hitherto been the case. This is a matter which your Committee consider well worthy of serious consideration. An object lesson is afforded in the customs of the people of the country, who aided by the produce from the few badly planted and badly tended fruit trees in their small gardens, manage with their wives and families not only so support existence, but in many cases to attain their ideal,—a life of absolute idleness. What is possible on a small scale for thousands of natives, even though the ultimate object be not the same, should be equally feasible on wider lines for a comparatively small community of Europeans The successful cultivation of catch crops means a proportionate reduction in the capital cost of estates, when the permanent products begin to be remunerative, and a less severe loss to face in times of depression.

Curing Establishment at Klang. The want of a store to which planters could send their parchment to be peeled having been supplied by Messrs. Barlow & Co's curing establishment in Singapore, and there being apparently no disposition on the part of any of the Ceylon or other firms who were approached, to start in Klang, this project has, for the present, been abandoned. On several properties stores have been erected during the year, and it now appears probable that if estates are to join issue in connection with the curing of their coffee, it will be a matter rather of private arrangement than of any combination under the auspices of the Association.

Retail Sales of Coffee.—The low prices which our coffee has been fetching, without, as far as we have been able to ascertain, any appreciable corresponding advantage to the consumer, has naturally led planters to consider the possibility of supplying the public with the prepared article "direct from the plantations" and appropriating to themselves some of the profits of the middleman.

Statistics of Acreage.—Under Cultivation, estimated crop and labour employed on the European estates in Selangor:—

No. of Estates.		Acreage under cultivation at end of 1898.	Estimated Crop in Pikuls for 1899.	Labour. Tamil.	Chinese.	Malays and Javanese.	Total.
70	Total for 1898 ...	14,361¾	18,715	2,937	627	898	4,462
68	Return for 1897 ...	12,689	13,503	3,285	1,249	1,094	5,628
2	Increase and Decrease in 1898	pl. 1,675¾	+5,212	— 348	— 622	— 196	—1,169

TEA CULTURE IN JAPAN.

Japan Tea is a favourite in the United States. The following extract from an American Consular report regarding the cultivation and manufacture of tea in the provinces of Kiushiu may perhaps interest our tea-planting readers:—

Fukuoku Ken (district.)—The product was 2,450,000 catties of (1·31 lbs. each) Tea is usually planted on hillsides, rarely on level ground. The plant is mostly of natural growth; but the ground is cultivated twice a year—in spring and in autumn. Manure is used only on the level ground. The manufactured tea consists of the lowest class The leaves are dried in an iron pan. A small quantity of good, green, and black tea is produced. The places of export were Nagasaki, Kobe, and Yokohama.

Oita Ken.—The product in 1894 was 356,959 catties, viz: Best fine tea. 6,115 catties; green tea, 227,717 catties; leaves manipulated in iron pan, 93,110 catties; black tea 5,000 catties; common tea, 25,017 catties.

Kagoshima Ken. The product was 1,250,000 catties. No manure is used in the cultivation, and the growth is natural. At certain seasons, grasses that hurt the plant are removed. Tea was formerly manufactured by very simple methods, but great improvements have been made. The course of manufacture is now as follows: (1) The leaves are stirred, as in the ordinary method; (2) tested over a fire in an iron pot and separated; (3) rubbed and rolled transversely; (4) rubbed and rolled in test jars; (5) stirred up to dry; (6) carefully and fully dried; (7) sorted, by sifting with different sieves, and prepared for market.

Nagasaki Ken.—The cultivation in this ken is conducted as follows: On inclined ground, the tea is planted in furrows, but on level ground, the plants are grown separately. The space between each row is about 3½ feet. On the hillside, it is planted in rows, but on the plain, near houses, circularly. After the first and second leaves are picked, the branches are cut with shears. The object in cutting is mostly to make the plant round or semi-circular. Formerly, the plant was cut down nearly to the ground every three years.

The ground is cultivated three or four times in the spring, summer, and autumn The grasses are cut and manure applied twice a year—in spring and in autumn. For manure, nightsoil, green weeds, accumulated soil, oil cakes, and fish are used. These manures are used only for plants near people's residences; for those on the hillsides, weedings are performed twice a year—in spring and in autumn—and the weeds are used as manure.

The season for gathering first tea buds or leaves begins on the 1st or 2nd of May, but, in some localities, first leaves are gathered about the 20th of May. Second buds or leaves are generally

allowed to grow, unless the market price is very high or the first leaves gathered are found much less than usual. In the vicinity of Omura and Hirado, however, they gather both first and second leaves. In picking leaves for the best tea, three tender leaves are picked together; for the middle and lower classes of tea, five leaves are picked at once; and for the lowest, all the young leaves are gathered.

For picking leaves, women are usually employed. The average quantity of the three leaves picked by a woman is from 10 to 13 catties a day, and her wages are from 4 to 5 sen (say 1d. to 2½d. for picking 6¼ catties. 8⅓lb.) For picking five or more leaves, the daily quantity for a woman is about 31¼ catties, (41⅔lb.) and the wages per 6¼ catties are 2 to 2½ sen. 1d to 1¼d.

The manufacture was formerly conducted in two ways, *viz*: By drying in an iron pan or in the sun; then drying in paper utensils was introduced, and more recently, drying in bamboo baskets came into vogue. The method of drying in the iron pan is still extensively used. For manufacturing black tea, the Indian method was formerly used, but at present the Chinese method is adopted.

For sorting tea leaves, heated in paper utensils, round and square sieves are used, and for rolling utensils either case or bag is used.

Nightsoil, oil cake, dried fish, green grass, and weeds are considered the best manure for tea plants.

The hours of labor are from 5 A.M. till 6 P.M The daily product per day per man is as follows:—With the iron pan, about 30 catties (nearly 40 lbs.); with the paper utensil, about 20 catties (26 lbs.); with the bamboo basket, about 45 catties (59lbs). The women are employed only at steaming the tea leaves, and are paid only half the rate paid men.

When the manufacturing season arrives, the workmen are hired daily, the farmers helping each other. In Omura, contracts are made beforehand by advancing money about January or February.

For renting a tea field, the landlord lends to his tenants without fixing the term, it being customary to rent the field after the tea is planted. The rent standard is rice, at the rate of 1½ to 2 bushels per one-fourth of an acre (300 tsubo) for the first three or four years after planting. Wheat or beans are sometimes used in place of rice. The rent is somewhat increased from the fifth year. In lieu of rent, the landlord sometimes takes half of the crop.

PRODUCE AND PLANTING.

Tea Drinking in Russia.—While perhaps the greatest tea-drinking nation in the world is still under the spell of the Chinese grower, the planters of India and Ceylon cannot say that there are no more markets for them to conquer. Possibly it is prejudice, or may be it is simple cussedness, but the Russians will have China tea, and a writer in the *Anglo-Russian* tells us that the chances are they will continue in their obstinate course for a long time, although that remains to be seen. This writer, however, tells us something of the habits of the Russian, who, he says, drinks enormous quantities of tea, sufficient to frighten any Englishman. The poor Russian, he says, uses the so-called "brick" tea. This is the cheapest sort, being mixed with the stems, and compressed by some adhesive gum into dry cakes of various sizes, resembling in its appearance "plug" tobacco. This tea, which would probably prove poisonous to any one else, is consumed by the Russian working man at the average rate of about 20 stakans (or tumblers) a day, the Russian stakan being quite equal to five of the little thimbles of cups used in England at afternoon teas. Indeed, a Russian won't be satisfied until "sedmoi pot proshibyot," or "the seventh perspiration breaks out," according to the popular saying. Taking into consideration that black, sour or bitter, brick-like bread, raw onions, garlic, dried leather-like fish, and strongly salted herrings are usually the chief articles of food of the people at large, one must not wonder at the enormous quantity of hot tea needed to still a Russian's thirst and help on his digestion. The inferior sort of tea is, besides, very cheap, but, of course, it is not the "brick" tea as used by the poor moujik that enjoys a world-wide reputation, but that in use among the middle and upper classes. In such households tea at the price of 5s. or 6s. per pound (0.90 of the English pound avoirdupois) is quite an ordinary thing, while in wealthier families 10s. to 12s. per pound is frequently paid, There are choice sorts of teas which are sold even at twenty roubles per pound, but of these only a few leaves are used to add an extra delicious aroma to the ordinary tea. Thus the high quality of the tea itself, brought overland and most carefully packed, is the chief reason of its superiority over the teas in use in Western Europe. But apart from the tea itself, the Russian method of preparing it goes a long way to contribute to the fine taste of the beverage. In this process the famous "samovar" plays the principal part, and a word or two of explanation will not be amiss.

The Preparation of Tea in Russia.—The "samovar" is the utensil used only for boiling the water. They are usually made of brass or copper, but there are also silver samovars, the inside being lined with another metal. In the middle there is a kind of chimney or fire receptacle, around which fresh cold water is poured into the samovar. Burning charcoal or wood is thrown into the chimney, and it usually takes about a quarter of an hour before the water begins to boil, this being announced by a volume of steam from under the cover Then the boiling water is poured upon the tea in the pot, and the latter placed on the top of the samovar to keep warm, as tea-cosies are unknown in Russia. The infusion is made very strong, but only about a fifth or quarter of a glass is filled with it, the rest being filled up with the boiling water. A slice of lemon or milk is added according to taste, and sugar is put into the glass, or used "v prikusku," as described above. There is no "respectable" household in Russia without one or more samovars. The utensil is turned out by the million. Tula, the Russian Sheffield, is particularly famous for the production of this article. The samovar is in use three or four times a day, in some houses indeed it is kept boiling the whole day long. The samovar may be really termed the Russian hearth and fireside. Around it the family and guests assemble drinking tea and chatting for hours. Its steaming and cheerful humming are as music to the Russian ear, accustomed as it is to the sound from earliest childhood. Even when leaving their native soil for far distant lands, when luggage has to be reduced to a minimum, the indispensable samovar is rarely left behind, and in the new countries of their adoption it forms frequently a melancholy link with the past.—*Home and Colonial Mail.*

THE INDIAN TEA ASSOCIATION (LONDON.)

The following is the interim report of the American and Foreign Tea Committee:—

The Committee now have the pleasure to lay before the members, as is usual at this time of the year, a review of the work undertaken during the period that has elapsed since the annual meeting, which was held in July last.

The subscriptions to the fund raised for exploiting new markets during the year amounted to Rs. 1,02.031 collected in Calcutta, as compared with 1,02,029 in 1897 and 1,03,674 in 1896. The planters in Southern India have, as before, contributed liberally to the fund, and a subscription of £200 from a London subscriber was again received last year.

A war tax of 10 cents per lb of tea imported was imposed last year by the United States Government towards meeting the cost of hostilities with Spain. This has had the effect for the time of seriously curtailing the importation of all tea, and has been a great hindrance to business. On the other hand, it has served as a useful advertisement, enabling attention to be called to the economy effected by using British-grown teas in preference to those of other countries

It is gratifying to learn that the prospects of India and Ceylon tea are much brighter in consequence of the strictness with which the law excluding poor tea is enforced in America. This falls heavily on the low class tea of other countries, although the recent sharp rise in the value of common tea must have a tendency for a time to check the expansion of the trade.

The Committee refer members to the accompanying report received from Mr. Blechynden, under date New York, January 10, in which he reviews the work for the year 1898. The Commissioners for India and Ceylon have continued to co-operate to the mutual advantage of both associations.

Fewer demonstrations have been organized during the year, as this work is being done by packet firms and others engaged in selling tea, but more money has been spent in subsidies and grants to those doing the work of educating the public and pushing our teas.

Advertisements have continued to be inserted in the principal papers, and are followed by those of houses dealing in British-grown tea.

The Committee call attention to Mr. Blechynden's remarks in his report on unfermented or Oolong tea, for which a demand exists,

although it must be borne in mind that this is a distinct class of tea for consumption in America alone, and failing a sale there, cannot be diverted to other markets.

The Committee have to thank Messrs. Gow, Wilson and Stanton for the following figures, which show concisely the progress made in the use of India and Ceylon teas in North America:—

India and Ceylon tea taken by the United States and Canada during each of the last seven years:—

	1898.	1897.	1896.
	lb.	lb.	lb.
Indian	5,972,000	5,663,000	5,259,000
Ceylon	7,637,000	5,699,000	4,365,000
Totals ..	13,609 000	11,362,000	9,624,000

	1895.	1894.	1893.	1892.
	lb.	lb.	lb.	lb.
Indian	4,072,000	2,428,000	2,111,000	1,586,000
Ceylon	3,745,000	2,295,000	1,871,000	1,490,000
Totals ...	7,817,000	4,723,000	3,982,000	3,076,000

The above figures show that a trade has now been established which may be expected to continue to increase. Your Committee are of opinion that the work Mr. Blechynden has been engaged in during the last five years, since his return to America in May, 1894, has been productive of much benefit to the industry and has been well performed, but there are now so many well-established and powerful agencies at work in the United States and Canada, whose interest it is to push British-grown tea, both by means of travellers and by the distribution of samples through the post and otherwise, that the Committee consider the further expansion of the trade may safely be left in their hands, and that it is not necessary for the Association to continue a special agency for the purpose. Any further assistance that may be required should, your Committee think, take the form of subsidies.

Your Committee hope to give more attention in future to the other new markets for our teas that are opening out on the Continent, particularly in Russia and France, and especially in connection with the forthcoming Paris Exhibition in 1900, where it is hoped that a good impression may be made by the arrangements that are in contemplation for serving Indian tea in connection with the building for Indian imperial exhibits. It is expected that 38 millions of persons will visit Paris next year.

Funds will be needed for these purposes and for assisting in the work of pushing the sale of our teas in France, Russia, Germany, Turkey, South Arica, or elsewhere.

Your Committee therefore recommend that a levy be raised in Calcutta on the same lines as before, but on the understanding that the funds shall be employed to push Indian teas in any part of the world and not in the United States only.

A. Bryans, G. W. Christison. D. Cruickshank, R. Lyell. J. Riddell, A. G. Stanton, J. N. Stuart. W. H. Verner, C. W. Wallace, Members of the Committee.

ERNEST TYE,
Secretary.

14, St. Mary-axe, E.C.
February 24, 1899.

THE NEW AMERICAN TEA LAW.

We take the following from the *American Grocer*:—

The new tea law goes further than the exclusion of impure or adulterated tea, and makes a quality standard. The result has been a general improvement of quality, but the question has been raised, and not without reason, that it is beyond the province of the United States Government to establish standards of quality. Naturally, some will ask, if the United States Government fixes a quality standard for tea, why not for sardines, spices, or coffee, of which some very inferior and trashy lots are imported? The chairman of the Board of Tea Experts, Mr. Phelan, in a letter to the Assistant Secretary of the Treasury, makes answer to this and says:

The reason for the incorporation of "quality" in the present law is because of the failure of the original tea law on account of not having "quality" established as a test. Under the old law "quality" was not mentioned, but the tea examiners were instructed to exclude teas which had "an adulterated, spurious or exhausted leaf, or such an admixture of chemicals or deleterious substances as to render them unfit for use."

After ten years' trial it was proven conclusively that no two tea men could agree on what was adulterated, spurious or exhausted leaf, or what constituted what was unfit for use. This law resulted in two evils—first, wild inconsistency and constant injustice; and second, the gradual admission of any thing that had the appearance of tea, until the country became deluged with the trash of the world to such an extent that the very existence of tea as an article of consumption became jeopardized.

To remedy all this and establish the most certain guide known to tea men the term "quality" was, with great care, incorporated in the new law as the only test which could be used with a minimum amount of uncertainty and inconsistency.

Mr. Phelan attributes the reduced imports to former importations of trash. This is true in part, but another cause is the narrowing of the difference between the relative cost of tea and coffee. One pound of tea at 50c, would make six gallons of infusion, costing 8⅓c per gallon; while one pound of coffee at 15c, would make two gallons of infusion, costing 8½c, and if the coffee cost only 9 or 10c per pound, the infusion would cost only 4½ @ 5c per gallon, while a 35c tea would make the beverage cost about 6c per gallon. If, however, a Ceylon or India tea is used, one gallon of infusion will cost from 5 @ 8c per gallon, making it a cheaper beverage than if Japan or China sorts are used, as one pound makes 10 to 16 gallons of infusion. The decline in the cost of coffee makes it relatively the cheaper beverage, and that, in part, accounts for the increased imports of coffee since 1896, and the decreased imports of tea. The net imports of the two articles compare as follows:

	1896	1898
Tea	83,549,331	66,290,691
Coffee	621,429,664	781,028,847

Trashy coffee is freely imported, but it does not seem to reduce consumption. Regarding the workings of the tea law, Mr. Phelan says:

After only one season and a half we have had almost all the evils of fifty years abolished from the trade and the country. The millions of pounds of decayed and spurious leaves with which we were inundated have been at last eliminated, as well as all the trashy and worthless flavors which have been so unfit for use as almost to drive tea out of consumption. This has been accomplished without any advance of price, excepting on the very trash which it was desirable to exclude. Until a recent advance, on account of the imposition of a duty which deterred importation, all the teas which had any substantial merit were sold at a lower price than ever before in the history of the tea trade. Good flavored Oolongs are procurable in large quantities for 14c per pound in bond, and good sweet young Hysons at 13½c per pound, the same quality of Congous (English breakfast) at 14c per pound, and Japans from 15 to 16c per pound. There is hardly an impure leaf in the entire importations of teas to America during the present season, and we go on record as receiving the finest crop of teas, not only in our own history, but in the history of any other nation.

The consumer has been thoroughly and absolutely protected without increase in price for fair quality, excepting by the recent duty imposed by Congress. The representation, therefore, made in the brief that great injustice has been done to the poor man is entirely at variance with the universally acknowledged facts.

In this connection we republish the statement from last week's market report, showing the importations of tea in 1898, and the sources of supply, as follows:—

FROM	Quantity lbs.	Value Dollars.
Japan	30,923,813	4,403,121
China	30,591,506	4,065,145
United Kingdom	2,537,671	506,554
East Indies	1,976,968	298,199
British North America ...	1,437,772	226,400
Other Asia and Oceanica ...	1,327,156	43,150
Other Countries	9,077	2,390
Total imports 1898	68,803,963	9,544,976
„ „ 1897	99,708,183	13,445,080

The above shows that Japan furnished 45 per cent. of the total imports; China, 4·44 per cent.

Before the 10c per pound duty, a very good tea was retailed at 20 @ 25c per pound furnishing a wholesome and palatable beverage at $3\frac{1}{3}$ @ $4\frac{1}{4}$c per gallon, but now coffee is the cheaper drink, for which and beer the American people seem to have a decided preference. The value of the 1898 imports of tea was $9,608,252, against imports of coffee valued at $62,674,241.

CINCHONA BARK AND QUININE.

The *Chemist and Druggist* of 11th ultimo has the following interesting remarks on these products:—

During the past five weeks, fully one-and-a-half million ounces of quinine have been bought and sold in London. Five or six buyers have been concerned in the speculation, and they have bought and sold "spot" and "forward" stuff. May-June delivery has been the favourite, but even November-December has been bought at 1*s.* $4\frac{1}{4}$*d.* per oz. These half-dozen speculators set themselves against the wisdom of all the sellers when they estimate that quinine is bound to be dearer at the end of the year than it is now. It is admitted all round that they are well advised, and the advice in some cases has been so excellent that some after making their bit have quietly retired. Something like 250*l.* profit a day has been made during the past month by sellers; what buyers will make remains to be seen. We have endeavoured to make it quite clear in our market reports that the quinine boom is fictitious in its scope. Two German brands of quinine alone have been greatly involved in the boom. Speculators have a fancy for these—why they cannot tell; but since so much of the "quinine" exists on paper only, one is as good as another for speculative purposes, provided the speculators agree to recognise specific articles. It is interesting to note the immediate effects of the speculation upon production. In the first place, there is no doubt whatever that the German makers have been buying every scrap of bark they can lay their hands on, and they want it urgently, which means that they have orders for quinine to fill. Professedly they do not supply speculators, and actually speculation stimulates production. That seems undeniable. But how much stimulus? The quinine landed in London last month amounted to 112,176 oz., against speculative sales of over a million, some of which were "forward." The January-February importations and stocks (at the end of February) of quinine sulphate for the last five years are as follows (in lbs.):—

	1899	1898	1897	1896	1895
Imports ...	15,402	10,811	4,556	5,293	2,750
Stocks ...	105,766	87,502	120,648	163,063	200,483

These figures show that there is enough stock in London to meet the transactions of speculators, which, though totalling a million and a half ounces, do not leave much in excess of half a million to be provided. A good deal of old quinine has changed hands. Various suggestions are put forward to strengthen the position, such as the statement that America will be buying soon; America is always buying, and could not afford to do otherwise seeing that she is the largest and steadiest consumer. The substantial justification of a rise in quinine is the fall in bark imports, which are very low, the Board of Trade figures for the past three years being:—

	1899	1898	1897
Imported ...	4,186	10,493	2,984 cwt.
Exported ...	4,754	2,503	799 „

These export figures substantiate our statement regarding exceptional German purchases this year, which have been as four to one by our other foreign buyers. The exports are also greater than the imports, which would be bad, were our stock on February 28 (20,061 bales) not better than on February 28, 1898 (19,293 bales) but that is not much to boast about in view of the decrease in the Java shipments. The latter decrease is too sudden to be natural. As far as we know, cinchona cultivation is not on the decline in Java, and it is actually extending in Ceylon, whose shipments this year are much better than they have been for four years, so that, although the supplies of bark at present look scanty, they are not so famine-stricken as to justify the extremely pessimistic views which obtain in some quarters. There is an all-round feeling that quinine has been too cheap for the bark-producer, quinine manufacturer, wholesaler, retailer, and consumer, and if it is not made too dear—*i.e.*, much above 1*s.* 4*d.* per oz.—it will be of benefit all round.

THE RISE IN INDIAN TEA.

Periods of abnormal cheapness are not infrequently followed by intervals of exceptional dearness, and such, says the *Grocer*, is the experience of those in the Indian tea trade just now. Several seasons of abundant and increasing crops following close upon one another had, up to the end of last year, so flattened the market that prices were forced down to an extremely low point, so low indeed as to make it almost impossible to produce tea at a remunerative figure; and many of the companies in India, considerable distances apart, were, as growers or importers of tea, beginning to find the industry an unprofitable one, so far as they were concerned. The wholesale dealers were also said to be losing money in the article by holding larger stocks than were supposed to be necessary, and buying brokers had more parcels on hand than they seemed to have any prospect of turning over at a profit. This was the state of affairs up to the close for the Christmas holidays, and nobody had the courage to initiate an upward move in prices, which would have paid them handsomely for their trouble

Everything was left to chance, and it was the opinion of the majority of the trade that, because Indian tea had been exceedingly cheap, it was going to continue so far an indefinite term. Meanwhile there were certain forces in operation which were calculated to bring about quite opposite results, and chief among these was the expanding use of the article, not only in this country, but in places abroad. British-grown tea is evidently an especial favourite with most classes of consumers, its merits in yielding a good, strong liquor in cup, and likewise in possessing a peculiar pungency of flavour, ensuring for it a ready reception wherever it is introduced; and every year a widening out of the consumption has been seen Marked as this was last year, when 133,430 350 lbs. Indian tea were consumed in the United Kingdom, in opposition to 124,534,194 lbs. in 1897, it has been even more so since; and during the past two months the London clearances alone of the same kind of tea for home use and exportation have been augmented by 2,191,200 lbs., the total a mounting up to 24,847,200 lbs., in contrast with 22,656,000 lbs in 1898. Whilst this expansion in the deliveries for general purposes has been going on, all surplus stocks in the hands of holders have been gradually worked off, and the stock of Indian tea here, which at the end of February, 1898, embraced 64,080,300 lbs., against only 55,424,700 lbs. in 1897, was by the 1st inst. shrunk to 59,460,000 lbs. It therefore now shows a deficiency of 4,620,300 lbs, instead of an excess of 8,655,600 lbs. as it did a twelvemonth ago

The recent advance in prices for common sorts—equalling from the lowest point $1\frac{1}{2}$d. to 2d. per lb. on all Indian teas below 8d.—has naturally caused quite a commotion amongst the blenders and purveyors of packet teas, which are a great speciality with the trade; and so increasingly difficult has it become to execute orders since the commencement of the year that purchasers in urgent need of stock have been compelled to enter the market for Ceylon and China descriptions, to pick up there such kinds as might suit them as substitutes for the familiar and useful varieties of Indian growths. Nor is there any alternative to this mode of dealing, which must be more or less cramped while the available supplies in first hands are diminishing, without the least prospect of an increase until the opening of a new season, and that is a long way off at present. The rise in prices, not having been brought about by over-speculation, is a perfectly genuine one, and it is because most parties are convinced of the soundness of its position, that they incline to the opinion that the recent advance in Indian tea is likely to be well maintained.

TWO OF A TRADE.

That two of a trade seldom agree is a common saying. Its weakness, however, resides in the fact that it is a cavilling, sneering saying. The idea sought to be conveyed is that the disagreement is the outcome of reciprocal jealousy While that is likely, it is not a necessary, or even a philosophical, inference. Two of a trade may easily see reasons for an honest difference of opinion to which the outsider is blind. Again, two of a trade may agree and both be wrong—on a point, of course, connected with their own industry. Some years ago there was high debate over the question whether a painting, exhibited in Paris, was an original Velasquez or a copy. Half the artists and *connoisseurs* in Europe got hot under the collar about it. It was one or the other—so they said. Later on the

fact came out. It was neither an original nor a copy; it was a *replica*. The experts were mistaken. And so runs speculative judgment in everything.

Here is the case of two doctors; both, doubtless, competent men. If they were wrong, or if only one was wrong,—but let us have the story first. It comes from a reputable source, and is well corroborated.

"In March, 1891," says the relater, "I had a severe attack of influenza, which prostrated me for two months. After this I could not get up my strength. My appetite was poor, and what little I did eat gave me much pain at the chest and around the heart. Sharp, cutting pains in the region of the heart seized me every now and again, sometimes so bad I feared I was going to die. At night I got little or no sleep on account of wind, which rose into my throat until I fairly gasped for breath. During the painful attacks of my complaint, perspiration would stand in beads upon my face.

"I soon lost strength to that extent I could not stand. Indeed, I was weak as a child. I was often so dizzy I had to catch hold of something to keep me from falling. Several times these attacks have come upon me at concerts, obliging my friends to conduct me home. As time passed on, I grew more and more feeble and abandoned all hope of ever being well and strong again.

"I had two doctors attending me who prescribed medicines; which, however, eased me only for a time and then I was as bad as ever.

"*One doctor said I had pleurisy; the other said I had heart disease.*

"For two and one-half years I lingered along, nearly as much dead as alive, all my relatives and friends thinking I would not recover. In November 1893, a book was left at my house in which I read of a case like mine having been cured by Mother Seigel's Syrup. My wife procured me a bottle from the Provincial Drug Stores in West-gate Street, and the first bottle gave so much relief that I continued with the medicine. I could then eat well and the food agreed with me; the pain around the heart soon ceasing.

"In a short time my strength returned and I got back to my work well and vigorous. Since then I have been *in the best of health.*) You are at liberty to publish this statement and refer to me."—Signed) William Henry Jervis, 48, Rendlesham Road, All Saints, Ipswich, November 13th, 1897.

One of Mr. Jervis' doctors pronounced his complaint to be pleurisy; the other said it was heart disease. Were they both right, or both wrong? Or was one right, and the other wrong? In the latter case—which one? Judging from the symptoms as set forth by Mr. Jervis the probability is that both were right—*as far as they went.*

The sac or bag which surrounds the heart (called the pericardium), and the sac in which the lungs rest (called the pleuræ), are parts of the lymphatic system; which is the especial abiding place and stamping ground of the kind of poison, produced by the diseased digestive system, and the cause of rheumatism, gout, pleurisy, and heart disease. Now, after (if not before) his attack of influenza Mr. Jervis suffered from acute dyspepsia with torpid liver, which engendered the poison that set up a mild form of both pleurisy and heart disorder. When the real and underlying ailment of all—the *dyspepsia*—was cured by Mother Seigel's Syrup these supplementary or consequential troubles vanished, as might be expected.

So we see that—strange as it may seem—two of a trade can differ and both be right.

MARKET REPORT.

By Mail advices of 10th March 1899.

COFFEE.

The *Commercial Record* says: The depression in this market continues, and the moderate supplies at auction barely half placed. A small proportion of fine colory Ceylon found buyers at about previous rates, but greyish low-grown was cheaper. Only a small qnantity of East India was offered and was all withdrawn. Medium qualities of Foreign origin moved off very slowly at a depreciation of 2s. to 3s. per cwt., whilst good ordinary to common were practically unsaleable. "Futures" show a further decline, brought about by continued large receipts and a fall in Exchange, but business is brisk and at the close there is a little steadier tone at the reduction.

London	... Santos	.. July delivery		... 29s. 9d.

Auctions this week have gone off as under:—

Ceylon—*Plantation.*—27 casks 17 tierces 8 barrels partly sold, smalls 56s to 60s, low middling nipped colory 80s, bold to extra bold 97s to 111s, pea-berry 121s.

East India.—113 bags withdrawn.

Jamaica.—Of 28 barrels 103 bags offered 30 packages sold—fine ordinary 38s 6d to 40s.

Costa Rica.—6,143 bags catalogued and a small part sold, smalls 26s to 54s, fine colory smalls 62s, fine to fine fine ordinary greenish colory 45s 6d to 48s 6d, low middling to middling colory 53s to 64s 6d, good middling 68s to 76s 6d, bold pale greenish 75s 6d, good bold smooth green 78s to 85s, fine middling blue 93s, good to fine bold blue 82s to 97s 6d. very fine 103s to 106s 6d. pea berry, 41s 6d to 120s.

Guatemala.—2,101 bags offered and 1,300 bags sold—small ordinary dull green 32s 6d to 36s 6d, fine to fine fine ordinary greenish 41s to 43s, low middling colory 47s 6d to 49s, middling 50s 6d to 58s, good middling to bold blue 60s to 74s 6d, fine bold 87s. pea-berry 48s to 84s.

Vera Paz.—73 bags partly sold, small 25s 6d, fine ordinary dull green 44s. low middling at 45s. bold 63s. pea-berry 44s to 50s.

Salvador.—Of 568 bags 125 bags sold—bold dingy gray 52s, pea-berry 55s.

Savanilla.—150 bags bought in.

Mexican.—Of 144 bags offered 80 bags sold. low middling brownish colory 53s, bold 62s 6d, pea-berry 52s.

Columbian.—Of 1,324 bags offered 550 bags sold, smalls 28s to 39s 6d. good to fine ordinary dull gray 32s 6d to 40s, low middling to middling greenish 53s 6d to 59s. middling dull grayish to colory 60s to 6 s. bold faded greenish 63s to 69s 6d, good to fine bold greenish colory 72s to 79s, pea-berry 55s to 64s.

Peruvian.—43 bags low middling blue sold at 48s.

Eucador.—572 bags withdrawn.

Brazil.—420 bags Santos retired unsold.

At to-day's public sales 1,486 bags East India 207 barrels 71 bags Jamaica, 2,031 bags Costa Rica, 167 bags Mexican, 1,369 bags Gautemala, 317 bags Columbian, 179 bags Salvador, 579 bags Porto Rico, 205 bags New Granada, and 112 bags Cuban were offered. A better tone in the market, and all Coffee at all merchantable sold with fair competition at full rates and more sold, but low mixed grades were irregular.

Prices realized at auctions for the principal Mark of East India :—

TEA.

China.—Congous are fairly steady, but Oolongs tend in buyers' favour 2,973 packages offered at auction this week and about half sold as under :—

boxes new make Congou 6¾d to 7d.
ditto Caper 5¾d to 8d.
half-chests Oolong 6d to 9½d.
ditto Moning 8¼d to 10d.
half-chests Moyune Green Gunpowder 4¾d to 11¼d, fine 1s 3½d to 1s 6½d. Imperial 3½d, Hyson 4½d, Young Hyson 4⅜d to 7½d, Sow Mee 6¼d to 1½d, Foong Mee 9d to 11¼d.
boxes Ping Suey 5¼d to 8d.

Indian. The auctions were lighter, comprising 35,000 packages against 45,400 packages last week, and 31,400 packages for the corresponding period of 1898.

In contra-distinction to this time in the previous year, when business both at home and abroad was quiet, the strong enquiry prevalent lately for the lower grades of leaf and also Broken Teas has continued, fully former rates to an occasional advance having been paid. The upward tendency in these has, however, somewhat detrimentally affected medium to fine kinds, aud although the attractive lines still commanded prior quotations, others were more or less neglected and in many instances easier. Quality of most of the arrivals was of useful character, but in some cases the appearance was brownish and mixed

Exports from London to the Continent, &c., as will be seen by the figures below, are progressing satisfactorily, nowithstanding that on account of the rise in values it was not practicable to execute a portion of the orders coming to hand recently.

For 27,000 packages on Estate account 9¼d. per lb. was realised. versus 8d. per lb. for 20,400 packages and 9d. per lb. for 19,500 packages in the two preceding seasons.

Ceylon.—Public sales were heavier. including 27,400 packages., compared with 20.400 packages on the 28th ulto., and 19.200 packages a year ago.

Common to fair Pekoe Souchongs, Pekoes, as also brokens and dusts were in strong request and very firm to ¼d. per lb. dearer. Medium Pekoes and Orange Pekoes showed some irregularity, but on the whole were unchanged. Broken Pekoes between 5d. and 11d. per lb. as a rule favoured buyers, but from 1s. per lb. upwards there was better competition and more money was often given to secure the choicest, among the best broken orange Pekoes being the following: Talawakelle 1s. 4¾d., Ingestre 1s. 4½d , Diyanilakelle 1s. 4d., Elgin and Lippakelle 1s. 3¾d., Wootton 1s. 3¼d., Hauteville and Lindoola 1s. 3d., Abbotsford, Campion, Goatfel and Taurus 1s 2½d., per lb.

February exports from the United Kingdom to other countries shew considerable expansion contrasted with the same month in the foregoing year, the higher range of prices current not having apparently checked this branch of the business.

The average is 8¾d per lb. On the 2nd inst. it was nearly 8¾d per lb., and 7¼d per lb. in 1898.

Java.—Nearly 1,200 packages passed the hammer, most descriptions meeting with a good reception and favouring sellers.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were :—

From 1st to 7th March, 1899 ... 4.345,736 lbs.
" " " 1898 ... 4,075,120 "

During the week the following have been printed for sale by public auction :—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India ...	32 099	2,949	35,048
Ceylon ..	25.555	1,808	27,363
Java ...	1,087	50	1,137
Total...	58,741	4,807	33,548

Also 831 packages from second hands.

Pimento firm but quiet. 305 bags offered and 78 bags sold, fully fair 4 1/16d per lb.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated March 10th, 1899, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON
From 1st June to Date.

	Indian	Ceylon.	Java.
1898-1899.	1,370,739 pkgs.	876,697 pkgs.	36,731 pkgs.
1897-1898.	1,328,871 "	928,422 "	32,611 "

35,492 pkgs. Indian
27,714 " Ceylon
1,165 " Java
} Total 64,371 packages were offered in public auction this week.

Some 18 million pounds of Indian Tea were diverted from London to countries outside the United Kingdom during 1898, thus affording considerable relief to the market. The quantity of Tea sent direct from Calcutta to these external markets has steadily progressed during many years past.

Indian. The late activity in bidding for Teas under 7½d. was obually pronounced this week, hardly any whole leaf Tea being now obtainable under 7d per lb. Medium to fair descriptions were still slightly irregular, although with a somewhat firmer tendency. The Autumn crop, taken as a whole, is distinctly preferable to last year, and many of the Teas now arriving have very good liquoring qualities. The following averages are worthy of note :—"British Darjeeling Co. Thurbo," 1/10½; "Assam Frontier Co. Khobong," 1/5½; "Jokai T. Co. Subansiri B," 1/5¼

Ceylon. With keen competition Teas under 7½d. were again slightly dearer. Teas above this price were somewhat overlooked and in many cases suffered in value. Hardly any whole leaf Tea can now be obtained under 7d. According to the Official wire the quantity available for shipment to the United Kingdom during March is expected to be 8 to 8½ millions. against actual shipments of 9,500,000 during March, 1898. Avgs. :—"Carolina T. Co., Gortfell," 1/1¼; "Dimbula Valley Elgin," & "Lippakelle," 1/-; "Associated T Co Silver Kandy," 11¾; "Taurus," 11½.

Average for week 8·66d., against 7·12d. same week 1898.

Ceylon Tea sold on Garden Account, 1st Jan. to date 1899, 201,726 pkgs., av., 8·26d. 1898, 227,298 pkgs., av., 7·70d.

		1899.	1898.	1897.	1896.
Pekoe Soug.	(Ordinary leaf; fair liquor)	7¼d.	5¾d.	6½d.	6¼d.
Pekoe	(Ordinary leaf, little twist; fair liquor)	8¼d.	6½d.	7½d.	7½d.
Pekoe Soug.	(Rather bold leaf; indifferent liquor)	6¾d.	4½d.	5¼d	5d.
Pekoe	(Somewhat bold leaf; indifferent liquor)	7¼d.	5d.	6d.	5½d.

Java. Sales reflected the conditions noted above in Indian and Ceylon Teas, competition being very strong and prices if anything slightly dearer.

The stock of Ceylon Tea for 1898 was erroneously printed in our last week's circular as 11,295,574 instead of 18,295,574; the total stock of all Teas in that year being correct, viz. :—101,077,073 lbs.

IN AUSTRALIA.

Sydney, March 6th.—30 half-chests of common Indians sold at 7¼d. in bond; 20 chests of Ceylon pekoe, 7¾d.; 25 chests of Ceylon broken pekoe, 8½d.; 40 heavyweight common panyong, 5d.; 100 ¾-chests of panyong at 8½d., and 150 ditto at 7½d. in bond. All teas "for price" were in keen request, other descriptions being more or less neglected.

Melbourne, March 3rd.—There has been a good demand for China tea at late advanced rates, and sales include 900 original half-chests at 5½d. Of Ceylon teas 200 packages have been placed at prices ranging up to 9d. Supplies of Ceylon now on the water are restricted. The "Darius," which is expected to arrive at Adelaide on Monday next, and at Port Philip towards the end of the week,

brings 4,982 packages Indian tea for Melbourne. *Later.*—At the tea auction, 450 packages Ceylon were offered, and 58 chests pekoe sold at 7¼d. to 7¾d. Importers' reserves were generally ¼d. to ¾d. over bids. Private tea sales cover 1,200 half-chests panyong at 5¼d. to 5½d., 250half-chests kooloo, 100 chests Indian at 6½d., 50 chests Ceylon at 6½d. to 7¼d.

COCOA

Supplies brought to the hammer on Tuesday were moderate, the total amounting to only 4,932 bags. The tone was firm, and on occasional movement in favour of holders was again observable, notably in the case of African and Ceylon. Of 896 bags Trinidad offered 440 bags sold at 76s to 77s for fine red, and 74s to 75s for fair to good 13 bags fine fermented Jamaica brought 72s 6d. 45 bags Grenada and 213 bags Dominica retired unsold. 15 bags Surinam—fine red—sold "without reserve" at 73s 6d. Of 251 bags Guayaquil 50 bags of good Winter Arriba were placed at 73s. 5 bags Samana sold, out of 427 bags catalogued, at 55s for sea-damaged. Of 517 bags African 140 bags fine red sold at 73s 6d, being rather dearer. Ceylon's offering was almost a record one—2,455 bags being brought forward—and, with a good demand, 1,200 bags sold at here and there improved values, viz., fine to superior bold and medium red 76s to 82s 6d, fair to good ditto 73s to 75s, medium and small 60s to 67s, pieces 72s, smalls 57s 6d to 65s, and black to good pickings 40s 6d to 64s per cwt. Privately sales are restricted to 200 bags Guayaquil-Caraquez at 72s, and red Arriba at 78s per cwt.

Import, Home Consumption, Export and Stock of Cocoa in London are as follows:—

		1899.	1898	1897.	1896
Imports, B.P.	bags.	32,440	43,055	33,810	34,778

PEPPER.

Black.—A very quiet market this week, with prices in buyers favor. Singapore has been sold at $5\frac{5}{16}$d for fair on the spot (closing sellers at the price) at $5\frac{21}{32}$d down to $5\frac{9}{16}$d April-June (s.), and at $5\frac{5}{8}$d May-July. About 200 tons sold

At auction on the 8th inst. 506 bags Penang were offered, of which 48 bags sold, sea damaged class I, 4 lbs. 8 ozs. weight, 4·38% dust per gallon 5d per lb.

White.—The market has also been very quiet, but is a shade firmer at the close. For arrival about 50 tons Singapore have been sold—near at hand at $8\frac{3}{4}$d, and April-June (s.) $8\frac{7}{8}$d. On the spot a small business has been done in fair Singapore at $8\frac{3}{4}$d, and fair Penang at $7\frac{7}{8}$d per lb.

At public sale on Wednesday of 334 bags Singapore catalogued 14 bags sold, fully fair $8\frac{1}{4}$d 328 bags Siam retired at $8\frac{3}{4}$d to 9d. 68 bags Penang offered and 10 bags fair sold at $7\frac{7}{8}$d per lb., average re-weights.

Market closes dull and weaker. Singapore on the spot 5¼d sellers for fair. May-July shipment 5⅝d sellers

50 tons Tellicherry June-August shipment have been sold at 5¼d per lb. landed terms London.

GINGER.

Cochin.—Offerings were very small, the total being only 26 cases, 173 bags, but this proved more than sufficient for the extremely limited demand. The market seems to have fallen on evil days, and it was necessary to again submit to a reduction of 2s. per cwt. on washed rough. 5 cases 93 bags sold—small and ends lean cut limed (1896 import) 27s, good medium and small, partly bold, bright washed rough 26s, leaner and brownish ditto 23s per cwt

Japan.—69 bags slightly mouldy, dull limed sold "without reserve" at 18s 6d to 19s per cwt, being lower.

Jamaica,—92 barrels were bought in at 70s to 82s. 2 bags *St. Lucia* realised 60s per cwt

A parcel of Cochin D's has been sold to arrive at 17s per cwt. c.i.f. London ex ship afloat.

CINCHONA.

The amount exported from Ceylon during the whole month of January was 16,164 lbs., against 66,101 lbs. for January, 1898. The United Kingdom received the total amount in January this year.

The shipments from January 1 to February 14 were:

	1899	1898	1897	1896
Lbs. ...	98,675	92,477	20.826	70,677

For the week ending February 14, 82,511 lbs. were exported—to London 73.373 lbs., and to New York 9,138 lbs. Buying of second-hand and other parcels has been going on steadily this week at the advance noted in our last (about 10 per cent.). Little now remains in second hands, and brokers are strong holders.

QUININE.

There has been another very active week, and the second-hand market has advanced from 1s. 3d. to 1s 3¾d. for good German in bulk on the spot, and to 1s. 4⅛d. for May delivery of the same. Last week closed with second-hand sales amounting to about 500,000 ounces, and this week the sales amount to about 250,000 ounces. The market to-day is very strong. Apparently no manufacturer, English or German, would sell to-day at last week's figures, and the Amsterdam factory have made a distinct move to 1s. 4½d.

CARDAMOMS.

There has been a fairly good business in all sorts this week, but chiefly in *Malabar*, small light fruit in which have sold at 1s. 8d., and barely fair quality at 2s. 3d. There were exported 35.060 lbs. from Ceylon in January last, of which the United Kingdom received 23,522 lbs., and India 11,158 lbs. The exports from January 1 to February 14 were:—

	1899	1898	1897	1896
Lbs ..	64,647	40,146	41,853	30,024

The shipments for the week ending February 14 were 17,892 lbs., destined as follows: London, 6,926; Hamburg, 5,424; Copenhagen, 2.016; Bombay, 1,998; and New York, 1,518 lbs. Business on this market proceeds steadily, at unchanged rates

Export of Indian Tea from Calcutta, during the last six years, as shown by figures of the Indian Tea Association.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 14th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

S. E. Wynaad.

Saint Catherine's Estate.—Davala, *5th April* 1899. *Weather.*—On the 31st March, 1st, 2nd, 3rd and 4th instant, we had good evening showers, to-day clouds are overhanging, and we expect a heavy shower. *Crop.*—Gleaning and despatching of crop finished on most of the estates, on some estates still current. *Plant Disease*—nil. *Interesting Items.*—The ryots are very busy in ploughing and sowing paddy, etc.

Coorg.

Polli Betta.—Heavy rain on Sunday and Monday, the 2nd and 3rd instant, amounting in several cases to over 3 inches; and sufficient in all. *Crops.*—This rain has been most seasonable, and crops ought to be fairly good. Where, however, trees have been overbearing, any amount of rain won't help matters. *Interesting items.*—Camp of instruction here a great success. Mercara camp now on.

TRICHINOPOLY PHOSPHATES.

The latest number of *The Agricultural Ledger* deals with the Phosphatic Nodules of Trichinopoly and the Use of Mineral Phosphates in Agriculture. It is from the pen of Mr D. Hooper, F. I. C., F. C. S., and is written "with a view to draw attention to the possibilities of an extensive bed of phosphatic nodules in Southern India in placing within reach of planters and native cultivators a useful fertiliser for improving their crops." We need not trace the history of the discovery of these phosphates. We are informed by Mr. Hooper that they are amorphous in their character and have no definite chemical composition, and hence cannot be regarded as purely mineral. In works on Mineralogy they are classified under the head of Apatites. The Trichinopoly phosphates are not coprolites, but "concretionary masses containing more or less calcium carbonate." They are of organic origin, and Mr. Hooper remarks that it will be difficult to apply to them any other more suitable term than that of mineral phosphates. "Their close association with mineral formations naturally leads one to regard them as inorganics, and the name mineral phosphate at once distinguishes them from bone phosphate, since it is well known that the osseous system of the animal kingdom consists largely of the same chemical constituents with varying proportions of other elements." The nodules contain for the most part a compound of lime, known as tricalcic or tribasic phosphate, with smaller quantities of iron, alumina. magnesia, silica and carbonic and sulphuric acids. The following analyses refer to 1 cwt. analysed by Mr. J. A. Voelcker in London and an average sample analysed by Mr. Hooper himself.

	Voelcker.	Hooper.
Moisture	1·53	1·53
Combined water and organic matter ...	2·85	2·66
Phosphoric acid ...	26 05	24·58
Lime	45·51	43·51
Oxide of Iron	3·14	8·62
Alumina	2·63	
Magnesia	34	·29
Sulphuric Acid	·60	·50
Carbonic Acid	7·23	7·38
Fluorine and alkalies	4·84	2 43
Insoluble siliceous matter ...	5·28	8·50
	100·00	100·00

For comparison with the above, Mr. Hooper cites some of the more important phosphatic deposits of the world and the percentages of phosphoric acid contained in them, as follows:—

Cambridge coprolites	26·6
Suffolk	25 2
Bedfordshire	21 0 to 25·0
German apatites	30·9 to 35 7
French phosphate	33·7 to 35·5
Norwegian chlor-apalite	35 6
Spanish phosphorites	36·3 to 39
Canadian apatite	33·5 to 41·5
West Indian phosphates	36·0 to 48 8
South Carolina (fossiliferous)	22·0 to 28·4

Turning to the question of what use can be made of the mineral phosphates of Trichinopoly, Mr Hooper observes that the chief use of coprolites and phosphorites is in the preparation of superphosphates or soluble phosphate of lime. As Dr. Voelcker remarked in his report on the Trichinopoly phosphates, the practical question for consideration is whether it would be profitable to reduce the nodules to superphosphate. The Secretary of State for India observed that the cost of machinery and chemicals for the treatment of 60,000 tons—the estimated yield of the Trichinopoly deposits—would probably more than equal that of the importation from the United Kingdom or the United States of America of any manufactured superphosphates required in India. Mr. Hooper evidently shares this view. Dr. Voelcker pointed out that the high percentage of iron and alumina was a drawback. The effect was, he said, to prevent a good nicely manufactured superphosphate being made. Besides, the soluble phosphate formed by treatment of the material with acid would be lower in amount, and likely to lessen still more on keeping.

As, however, mineral phosphate can be successfully employed in a raw state, provided it has been disintegrated, there remains this method of making use of the Trichinopoly deposits. The phosphate, even in a disintegrated state, is not soluble in water, but the action of the soil and the rootlets of plants render them in the course of time available to the crop. As Mr. Hooper observes, the question for the farmer is not one of water solubility, but of assimilability of the manure, and until we know more about the natural decomposition induced by the soil and the action of root hairs, before it is rendered available for the plant, artificial tests lead only to conjecture. Still, experiments that have been conducted elsewhere show that the possibilities of phosphatic deposits such as those of Trichinopoly are far-reaching. The nodules may be employed in one of three conditions: as a simple powder, as a high grade superphosphate, or as an intermediary product prepared by intimately mixing two parts of the super or acid phosphate with one part of the ground mineral. After referring to some interesting experiments conducted by himself, Mr. Hooper concludes that there is no question as to the benefits to be derived from the employment of mineral phosphate in Indian agriculture. It is known in regard to the Nilgiris, for instance, that there is a deficiency of lime and phosphoric acid in the soil. An addition of these two ingredients has always proved beneficial to the local tea, coffee and cinchona estates. Medicinal plants, in particular, would appear to benefit. It has been proved over and over again in cinchona culture that nitrogenous and phosphatic manures increase the amount of alkaloids in the bark, and Mr. Hooper evidently considers that Trichinopoly phosphates might be turned to good account, for the manuring of medicinal plants, at least.

COFFEE IN DISTANT LANDS.

V.

Bolivia.—Some of the best coffee in the world is grown in the province of Yungas, and though the quantity obtained is small, there is a likelihood of its increasing. At present most of the production is consumed in the country.

Ecuador.—The coffee crop of 1893 reached over 50,000 quintals, being considerably larger than for any previous year. As there was much more land in coffee the next year, a still larger crop was gathered, and since then the figures

have inereased still furthers. The information from the Daule, Boliche, and Zaguachi districts was very favorable. The new crop begins to come in during July and August. The attention of agriculturalists has been directed to the planting of coffee in the mountain districts, from 2,000 to 5,000 feet above sea level, and there is a vast extent of available land which can yet be utilized for the growth of coffee. When handled properly, the coffee grown in Ecuador is of superior quality. The American Consul reported in 1894 :—"I have no doubt but that, in a few years, it will deserve a separate classification in our markets as Guayaquil coffee. Besides the coffee lands tributary to Guayaquil, there is a large area of the very finest coffee lands in the upper provinces of Esmeraldas and Manoba. The British consular report for 1896 alludes to larger exports, but gives no figures.

Nicaragua.—From an American Consular report we learn that owing to the lack of rainfall in a portion of the coffee-growing section of the country—that portion nearest the Pacific Ocean—during the last three years, the crop of 1896-97 was not a full one. The quality also suffered in a slight degree. The planting of young trees went right along from year to year, so that with a good season and a full crop Nicaragua would have produced fully 50,000 bags or 5,000,000 pounds more than in any previous year. The Matagalpa region, in which is located the American colony, is in the interior of the country, and it is benefited by the rains which come up to it from the Caribbean Sea. Consequently the crop of that region was double that of 1895-96, the export reaching 1,000,000 pounds against about 500,000 pounds in 1895-96. The Consul remarks :—As going to illustrate the growth of this industry in that section, I note that when I came here four years ago there were but twenty-eight Americans—men, women and children ; there are now in the colony ninety Americans. One, and only one, American child has been born in the colony—a daughter to Isaac A. Manning and wife in June 1896. At that time (1893) the number of coffee-trees, but few yet in bearing, was reported to be less than 50,000 ; at this time the number exceeds 7,000,000. With a good season, it is estimated that the crop next year will, owing to the young trees coming into bearing, reach the amount of 4,000,000 pounds. The American capital represented about Matagalpa in 1893 did not exceed $50,000 (United States currency). At the present time, the investments in Coffee culture of American companies aggregate $405,000 and individual investments $155,000, making a total of $560,000 (gold) a gain of $510,000 within four years. The quality of the Matagalpa coffee is equal to the best Costa Rica and Guatemala article, which in the markets of the world, is "equaled by few and excelled by none." As to the healthfulness of that region, the Manning Bros., to whom I am indebted for the figures and general information in this despatch, say : "After a residence of four years here, we can testify as to the absolute absence of 'miasma' in this region. The general health of the colony is and has been very good. There has been no sickness among the members traceable to the climate. There have been but three deaths among the Americans in five years, none of which were due in any measure to climatic influences." The climate is agreeable, the thermometer ranging from 65° to 85° F. The principal population of the district is Indian, of whom there are believed to be more than 40,000. They furnish the principal and best labor. They are easily led, but can not be driven. As to wages, the Messrs. Manning write : "Common Laborers on the Coffee estates are paid from 30 to 50 cents. per day ; teamsters, $12 to $20 per month; plantation foremen $20 to $30 ; carpenters, $1 to $1·50 per day. We need a good machinist, with his tools and a set of job machinery,—a man who can turn his hand to any repair work and who is a blacksmith. Such a man would have about all he could do at good rates. There is a good opening here for a doctor, and he should open a fairly well-stocked drug store." Living expenses are not high—about the same cost here in silver as in the West of the United States in gold ; rents, about the same, but neither the houses nor the living are equal to what our citizens are accustomed to at home. Most of the vegetables we are accustomed to grow here ; cabbages, onions, tomatoes, and lettuce do well. Potatoes, do not completely mature, but are eatable. Tropical bulbs, yucca yams, and a sort of sweet potato are all relished. Such fruits as the orange, pineapple, banana, limes, etc., are extremely fine, but no successful attempt to raise the fruits of the temperate zone has been made. Cacao and rubber do well at an elevation anywhere up to 1,500 feet, and some attention is beginning to be paid to the cultivation of these crops in the lower lands between Matagalpa and the Atlantic. Cattle are extensively raised. Cows sell for from $10 to $20 ; oxen $30 to $40 ; mules $80 to $150 ; horses $20 to $50. The cattle are good, mules fair, and horses poor. The dairy business is quite extensive ; the product is cheese, which sells at .25 cents. per pound. Chickens are plentiful at $4 to $6 per dozen. Butter is scarcely known and of poor quality. Corn and beans flourish and are profitable crops. Wheat, oats, rye, and barley do not grow. The only mills in the country are old stone mills, without the bolting process. Lands can still be had from the Government for actual cultivation at a cost of about $3 (silver) per acre. Lands are covered with heavy, tropical forest and without roads to them.

Private advices dated as recently as 27th February 1899, state that the country is completely disorganized. The coffee is spoiling on the trees, as the labourers are drafted into the army. A war contribution of $200.000 has been levied on the inhabitants of Granada, and the export tax on coffee has been raised to $4 per quintal.

CEYLON BLENDED TEA.

Apropos of Mr. Blechynden's allusions to the desirability of bulking tea in Calcutta, we quote the following interesting remarks by a Ceylon planter, who writes to the Ceylon papers advocating the blending of tea at Colombo :—

With relation to teas, if there is one accepted fact more than another, it is that the British consumer has a preference for blended teas. The custom of the blender is to buy a certain quantity of various qualities and out of them to make a drinkable tea, for price, at the smallest cost to himself. This has resulted in the smaller country blender and dealer being almost thrown out of the market and the consequent larger London man acquiring an undue influence on the London market, and this looks as though it might go on until he has a monopoly altogether. Then, what will be the use of a Public Sales Auction mart? It will become simply "a knock out."

Surely it is time that the question of bonded warehouses and blending teas in Ceylon should be considered. There are buyers and there would be more, for they know what would re-sell best. Excepting perhaps some Chinas and some Darjilings, most Ceylon teas, more than others, can be drunk alone : yet few will be prepared to admit that any, even including the above, are so attractive as when judiciously blended ; and thus think the blender and consu-

mer: so it is no use bringing abstract ideas against practical conclusions.

Some years ago I proposed a scheme for introducing Ceylon teas into America and impressed my opinions fully on the necessity of the American dealer supplying blended teas to consumers. There is not the slightest doubt but that this is the line to be adopted. Americans have not hitherto proved themselves willing to drink either Ceylon or Indian tea, pure and simple; and this has been expressed by many writers, including our Commissioner, over and over again. I fear, however, Ceylon has lost the chance now of selling blended teas to America, if it ever possessed it, although other new countries are still assailable.

There are strong pungent flavoury teas grown in India, which if blended in inconsiderable proportions with many Ceylon light teas, would raise their values in the Colombo market, and besides make them more acceptable in other countries. In other words a judicious use of Indians would help the extension of four-fifths of the Ceylon-grown article. I do not say that Indians are superior to Ceylons: such would be treason, even if I thought it, which I do not; but I will, however, say that not using the geographical position of Colombo for this purpose, is neglecting one of the great advantages that the island possesses.

At present there are regular buyers in the Ceylon market and a fresh incentive would be established by those who, by blending a small proportion of foreign teas with Ceylons, would raise the value of those special kinds for which everyone would be pleased to meet with a better demand and price, resulting in obtaining help where most needed and producing qualities practically suited to the wants of the whole universe. At present Ceylon in adhering to sell not exactly what the buyers require, is injuring herself.

I doubt if requirements would be shipped from Calcutta or China to Colombo, cheaper than to London; so that the object in introducing would not be for the benefit of those countries, but to make the most of Ceylon teas. Neither is the importation likely to be overdone, as it would cost too much.

The consumption of tea is doubtless spreading over Europe; so if the merchants of Colombo could only adapt their samples to the wants of Southern Europe, saying nothing of the Persian Gulf and Egypt, a grand future is before them for the blended article. No country in the long-run could compete with them in the East. It does not much matter how the Ceylon planter is willing to view the question:—blending, if not done in Ceylon, will be done elsewhere; and if in Colombo the extra cost of extra shipment, carriage and landing will handicap the imported tea to such a degree that the object will be to use as little foreign, and as much locally-grown, as the blend will stand, and this always in a growing degree; so that in the long-run Ceylon teas will be most benefitted. Besides, from what I have seen, I believe it could be much better done in Ceylon than in London and as I have said its position seems to have been naturally chosen expressly for the purpose Indeed it is a great pity, that from the first, when Ceylon emerged into the world as a tea-growing country, it did not also start a universal market.

As I see blended teas winning their way everywhere, I write in no interest otherwise than that of a tea-grower, in whose basket most of my eggs are lying. As time goes on, Ceylon will be brought in closer competition with Assam, and perhaps Java: so I consider it is now acting unwisely in not using its best means of making the most of every chest of tea shipped from its shores. That is, no effort should be lost in making the tea attractive, and not have it cast aside as wanting, and so knocked down to the buyer almost at his own price. Nothing, I believe, would benefit the Ceylon grower more than shipping blended teas into London; as it might bring back the smaller buyers into competition with the larger who are gradually and effectually dominating the market. Again, probably four-fifths of the Ceylon tea shipped would be placed more attractive, if wisely blended with suitable teas of other growths, and which in time would find their own markets and help to prevent the heavy drops in prices experienced during the last two years.

Prices are now looking up again; yet, after my past experience, I am inclined to think that, if growers are most careful when times are good, they will have less to rue, when they go down again.

W. F. L.

INSECTICIDES *v.* TEA BLIGHTS.

Vol. IV. No. 3 of "Indian Museum Notes" contains a very interesting paper by Mr. W. J. Fleet. F.E.A.S., on "Some comparative trials of insecticide pumps in relation to the treatment of *Tea Blights*, and experiments in the treatment of Red Spider. All the machines used were of the knapsack form, and supported on the back by means of straps. When in working order they were placed in the hands of coolies, whose work, however, was under constant supervision. The machines used were:—

Powder Diffusers:—

1. Strawson's "Coronette."
2. Vermorel's "Torpille."

Liquid Sprayers:—

3. Vermorel's "Eclair"
4. Strawson's "Notus."
5. " "Improved Antipest."
6. Chiswick Co's Sprayer.

Mr. Fleet's description of the above pumps is as follows:—

1. Strawson's "*Coronette.*"—A well-constructed diffuser for sulphur and powdered preparations. The bellows are placed at base of the machine in a protected position and are worked by a side lever. The powder meets with the blast from the bellows after passing from the body of the knapsack through a fine grating on which oscillates a brush. The density of the spray can be regulated by a feed-slide.

2. Vermorel's "*Torpille.*"—This is very similar in principle to the preceding and did equally good work. The bellows are placed on the top of the knapsack. Three moving rods act instead of a brush to feed the material to the grating.

3. Vermorel's "*Eclair.*"—This sprayer did excellent work, working throughout all experiments without choking or any hitch. Power is applied by means of a side lever. The spray is fine, of considerable force and can be directed as desired by means of a moveable nozzle.

4. Strawson's "*Notus.*"—This sprayer, of a useful size, is specially suited to insecticides containing matter in suspension, as owing to the presence of two moving blades or stirrers the liquid is kept in a continual state of agitation. A series of nozzle caps permit of regulating the fineness of the spray.

5. Strawson's "*Improved Antipest*"—A well-constructed and finished sprayer. Possesses the advantage that all working parts are exterior to the knapsack containing insecticide. A side lever works an air-pump. Two tubes connecting the nozzle to the machine, carry the one the insecticide, the other the compressed air. The air acting on the liquid at the point of junction at the nozzle mouth, produces a spray of varying form. The latter is regulated by two stop-cocks, one controlling the flow of liquid, the other the supply of air. The sprayer, owing to the want of means for agitation, is only suited to insecticides in a state of solution.

6. Chiswick Co's "*Sprayer.*"—Gives a large and powerful spray, and can be used for insecticides both in states of solution and suspension. Worked by a top lever and handle on the thrust and pull principle. This was found to be much more fatiguing when in continuous use than machines fitted with side levers in which the weight of the arm is utilised in the stroke.

As to the experiments in the treatment of Red Spider (*Tetranychus bioculatus*) he says that they were commenced on the 29th April. Red spider came into existence later than usual, and then, also, the object of the experiments was not to prove the value of sulphur, or preparations containing sulphur in the treatment of Red Spider (this being now a generally acknowledged fact) but to make a comparative trial of several insecticides that have been recommended or suggested. It was necessary, therefore, to delay operations until a considerable area of garden was attacked, to allow of the selection of a series of plots of an even character. An extent of old tea,

heavily pruned some years previously was selected for the uniformity of the attack. The gar den immediately surrounding the plots was sprayed with soft soap and sulphur to prevent, as far as possible, the spread of Red Spider from the surrounding area to that of the plots. The insecticides used were :—

No. 1. Sulphur (on a fine powder.)
„ 2. Strawson's "Tea Velos" (a fine powder.)
„ 3. Soft soap and Emulsion.

Sulphur	... 2 lbs.
Soft soap	... 2 „
Water	3 gals.

No. 4. Kerosine Emulsion

Kerosine...	... 2 gals.
Soft soap	... 1 quart.
Water	... 1 gal.
Sulphur	... q. s.

No. 5. Chiswick Compound.
(1 to 10 of water.)
No. 6 Strawson's "M" Insecticides.
„ 7. „ "C. S." „

The powders (Nos. 1 and 2) were applied by means of diffusers in the early morning when the dew was on the foliage and so admitted of the appearance of the dressing. Dry weather favored the application of the insecticides, and no rain fell till 5th May.

Examined on 1st May, the plots were reported on as follows :—

No. 1. No live spider to be found.
„ 2. „ „ „
„ 3. About 90% dead; a few weak and struggling.
„ 4. Slightly superior to No. 3.
„ 5. Similar to No. 3.
„ 6. Inferior to Nos. 3 and 5.
„ 7. Similar to No. 6 except bushes that were rather literally sprayed.

Examined on 5th May, no rain having fallen, No. 4 seemed to have fallen behind. Nos. 3 and 5; otherwise no change.

Examined on 10th May, after heavy rain,
Nos. 1 to 4. Practically free from spider.
„ 5 & 6. Less so.
„ 7. Spider numerous.

Examined 15th May,
Nos. 1 & 2. Excellent.
„ 3,4 & 5. All good.
„ 6. Defective.
„ 7. Red Spider fairly noticeable.

Examined 15th June,
Nos. 1 & 2. Practically no Red Spider, only one or two leaves found by careful searching.
No. 3. Nearly as good.
„ 4 & 5. Bushes here and there showing little spider.
„ 6. Not so good as the two previous.
„ 7. Still more Red Spider visible.

The plots and surrounding four rows are described as "easily distinguished at a glance from rest of garden."

Examined 15th July, "Heavy rain has brought on vigorous flushing, and the plots and surrounding garden are uniform in appearance." Mr. Fleet's concluding remarks are as follows :—

"An interesting point brought forward in the foregoing experiments, is the success attending the application of such an inexpensive insecticide as dry sulphur. All preparing and mixing of ingredients is done away with, a great saving of labour is effected as water carriers are not required, and the sprayers are much less apt to choke and get out of order than those containing a liquid. Some extent of garden was dressed by women shaking bags of sulphur over the bushes. The bags were formed from squares of dammer. A large area can in this manner be rapidly got over, but very much more sulphur is required than when using the sprayers. Sulphuring to be effective should be done in the early morning when the dew is on the leaves. The sulphur then forms a thin coating over the surface of the leaf. This result is not so well secured after rain, as the latter tends to collect in drops on the smooth surface of the leaf, causing an unequal adhesion and distribution of the sulphur. With regard to liquid preparations of insecticides, allowing the drawbacks previously mentioned, they possess the advantage of being applicable throughout the day."

U. P. A., S. I. SECTION.

[Under the control of the Secretary, U.P.A. S. I.]

The Chairman has addressed a letter of thanks to the Hon. Mr. J. D. Rees for his remarks on the subject of Extradition, and his kindly allusions to the planting community of Southern India, at a recent meeting of the Imperial Legislative Council.

* * * *

Sir W. T. Thiselton Dyer, K.C.M.G., has forwarded for the information of the Madras Government a copy of Bulletin No. 18 (New Series), of the United States Department of Agriculture, Division of Entomology, which contains the following reference to the attempt made to import lady-birds into this Presidency for the purpose of destroying scales pests on coffee :—

Encouraged by the favourable results which have followed the introduction of certain beneficial lady-birds from Australia into California and later into Hawaii, the United Planters' Association of Southern India, an organization composed chiefly of tea and coffee growers, raised a fund late in 1897, amounting to something over Rs.7,500 (approximately $3,000), for the purpose of making an effort to introduce beneficial insects from Australia which should advantage their plantations.

Mr. Howard O. Newport, himself a planter, was commissioned by the Secretary of the Association early in January 1898, to proceed to Australia and to place himself in relations with the Department of Agriculture of Queensland and to make every effort to bring over to India living specimens of desirable species. Mr. Newport sailed on the 30th of January and returned on the 20th of June. His report, which is published in a journal called *Planting Opinion* of the 16th of July, indicates that he went about his work in a very intelligent and painstaking manner, that he had the hearty co-operation of the authorities of the department of agriculture of Brisbane, and especially the expert advice and assistance of the well known entomologist, Mr. Henry Tryon. He collected 2,540 specimens of *Orcus Australasiæ*, 1,500 *Cryptolæmus montrouzieri* and 246 *Rhizobius Ventralis*; in all some 4,300 odd insects. A special ice box was constructed and the journey was made without mishap 30 days elapsing from the day the last insects were placed in the box until the time of opening. The insects were kept at a reasonably uniform temperature of about 25° F., but when the box was opened the insects, although appearing fresh, were without exception dead. The expenses of the trip amounted to about $1,600.

Not discouraged by this unfortunate result the Association at latest advices intends to try it again. They have not, we understand, met with encouragement at the hands of the Indian Govern-

ment, and the venture is purely a private one It would not be at all surprising if the efforts should eventually succeed.

Theoretically, Australian lady-birds should flourish better in Southern India than in California, and it is very probable that *Rhizobius Ventralis* will feed with avidity upon the lecanium scales which affect the coffee and tea plants. The writer is inclined to believe that it will not be found necessary to go to the expense of keeping the insects on ice for a thirty days' journey, even in a tropical region With plenty of food and a comparatively small number of lady-birds in all stages of existence there is no reason why the insect should not breed during the entire journey. They have been sent in this way successfully in midsummer on a twenty-five days' journey from San Francisco to Portugal, and should certainly survive the trip from Sydney to Colombo in the same way.

NOTES.

Sale of a Ceylon Estate. Beddewelle Estate in Kadugannawa North has been purchased by Messrs. Farquharson from Mr. D. W. Skrine. The property consists of 570 acres of which 112 are cultivated —73 with tea, 7 with coffee and 31 with cacao.

Caterpillars & Coffee. The *Singapore Free Press* observes that the Coffee estates in Selangor that have suffered most from caterpillars are those in which the plants are raised from Pengerang seed Mr. Bailey is reported to have a theory that there is something peculiarly sweet or attractive in trees raised from that seed.

Mechanical Tea Bulking. Having remodelled his machine, Mr. Apjohn gave a fresh demonstration on the 28th ultimo. We need not describe the machine, as altered, for it failed to work properly and did not produce a tea of uniform quality. When worked with only one grade of tea by Mr. Apjohn himself, it is said to have run smoothly; but when worked with two grades, some of the valves did not let the tea run smoothly, while others did, the result being, of course, irregular mixing.

The London Tea Market. Cabling to Colombo on 29th ultimo, Messrs. Gow, Wilson and Stanton reported a fractional advance in prices. Fair liquoring C. P Souchong 8*d.* and the average 9¼*d.* (with ½*d.* up). "Fractional advances" of this kind will be greatly appreciated by planters. Advices dated 3rd instant stated that 1,900 packages Ceylon tea had been sold out of 1,900 offered, and quoted Pekoe Souchong 7¾*d* (½*d.* up) and average 9¼*d.* (⅜*d.* up). The average of Indian tea was 9¾*d.* (¼*d* up).

Indian and Ceylon Tea in Canada. An advertisement in the *Canadian Grocer* says:—"In 1890, 14,000,000 pounds were consumed in Canada and the United States, while in 1898 the consumption in the same countries was over 61,000,000 pounds, showing the enormous increase of over 47,000,000 pounds. This marvellous and universal appreciation is due to merit alone, as it is an established fact that these are the purest, cleanest, tastiest and most economical teas the world produces."

Mexico's Coffee Exports. The 30,620,000 lbs. of coffee sent from Mexico to the United States in 1898 brought, on an average, 9·8 cents a pound in gold, or, approximately, 19·6 cents silver. Meantime, the Brazilian shipment of coffee to the United States fetched only 5·4 cents gold, or 10·8 in our money. The difference in the value of Mexican coffee the Mexican newspapers hope will be noted. There is said to be ample room for Mexican coffee-planters to increase their sales in the United States. They are not getting as good a price as the Costa Ricans and Nicaraguans, who have done about as well as the Java planters in price.

American Tea Standards. Samples of the new standards of tea, as agreed upon by the tea examiners, have been forwarded to Washington for confirmation. The *American Grocer* says:—"They compare with the present standards as follows: North China Congou, same; South China Congou, shade lower; Foochow, about same (an extra grade of Foochow was made, which is lighter drawing); country greens, higher; basket-fired Japans, slightly higher; pan-fired Japans, slightly lower; Japan dust, lower; no standard for sun-dried Japans; Formosas, slightly higher; Ping Suey, slightly lower; India and Ceylon about the same. The standard for Amoy will be selected later.

Cinchona & Quinine in the U. S. From a report issued by the U. S. Bureau of statistics, we gather the following statistics of imports of Barks (including Cinchona) and Quinine:

	1896.	1897.	1898.
Bark Imports	2,598,679 lbs.	2,696,366 lbs.	3,512,449 lbs.
Quinine Sulphate, &c., Imports ...	3,166,530 ozs.	4,364,823 ozs.	3,893,541 ozs.

Unfortunately, Cinchona statistics are not given separately.

The Florida Velvet Bean. Captain E. A. Wilson writes from Florida to *Indian Gardening*:—'Where oranges will grow the Velvet Bean and the Pineapple are thoroughly at home. Here, in Florida, we use the Velvet Bean crop—leaf and vine—as a fertilizer for our orange groves, and the bean ground up, pods and all, as a fertilizer for pineapples; and there is nothing in the world, yet discovered, that is better. As a quick money crop, there is nothing your farmers can grow that begin

to touch them, as they are both annuals, and can realize from them in 12 to 16 months. New South Wales are giving the Velvets a trial. I shipped 700 lbs. to Mr. G. Hemsley, Moss Vale, yesterday *viâ* New York and San Francisco, thence by steamer."

Attar of Roses (Limited).

Drugs have not expelled the sense of humour from the *Chemist and Druggist's* system. Our contemporary remarks:—"The *Financial News* makes a point of a press-cutting in regard to an alleged attempt which is to be made by a Madras company to plant an acre or two of Wynaad land with roses, with a view to the manufacture of "attar." This is a terrific plunge for the Madras company to make. It may upset the market as it has never been upset before, because it rarely happens that a whole acre—capable of producing about 10*l.* worth of otto—is laid bare at one fell swoop for such an odorous purpose." As it happens, it is a firm, not a company, that is to make the trial, and we imagine the firm does wisely in making only a small experiment at first until it "sees its way."

Coffee in South Sylhet.

A correspondent of the *Planter* writes:—"On a neighbouring garden they have commenced to pluck their Liberian coffee berries. The crop is a very heavy one, but, as I believe is the peculiarity of this species, the pulp (if the mesocarp of the Liberian coffee seed may be called by that name) is hard and does not nearly get so soft as that of the Arabian, and is much harder to pulp than that variety. The Arabian bushes seem to have set their berries well and are making good fruiting wood for next year: in most cases too much by more than half, which necessitates handling. The bushes to which I formerly alluded as having given 2 lbs. per bush have set an enormons crop again this season and they are making good wood for next year's crop, and not a single diseased leaf to be seen upon them."

Queensland Coffee in England.

Messrs. Henry Devitt and Co., offered a parcel of Queensland coffee at Mincing-lane—about a quarter of a hundred weight—but the smallness of the entry prevented bids, says the *British Australasian*. This is a pity, for the coffee has been carefully examined and tested by experts, who report most favorably. The coffee arrived unhusked, and is considerably superior to the berries grown in Figi, the nearest rival to Queensland in the cultivation of this article. A broker divided the beans into three lots, and then valued them at 50s. 55s. and 65s. per cwt Coffee plants take four years to arrive at bearing age. In the Mackay district of Queensland coffee has been grown for some years; it is sold locally. "Great Britons" drink very little coffee, the import looking quite infinitesimal alongside tea, but good qualities will always command a market.

New Quinine Contract Clause.

London brokers interested in the sale of sulphate of quinine held a meeting on the 10th ultimo, at which the following firms were represented. Messrs. G. T. Benton and Son, Dalton and Young, S. Figgis and Co., French and Plucknett, Jenkin and Phillips, Hicks and Ashmore, Lambert and Strong, Marshall and French, Wilson, Smithett and Co, C. M. and C Woodhouse, and Sanderson and Co. Mr. C. Woodhouse was in the chair, and a resolution proposed by Mr. Hicks, and seconded by Mr. Bates (S. Figgis and Co.) was unanimously carried. The effect of the resolution is to insert a clause in contracts for the sale of quinine, stipulating that any quinine tendered on contracts in future which arrived before January 1st, 1-90, shall, at buyers' option, be taken at average reweights or with 2 per cent. allowance in lieu of reweights (reweights to hold good for 10 years), but the buyer must declare his option on or before the Wednesday preceding the prompt.

"Coffee-Planting and Self-Help."

Is the title of a letter from Mr. W. R. Rowland, of "Lamquart, Port Dickson" to the *Singapore Free Press*, in which he mentions disadvantages of Malayan planters:—"1.—Having to dry our coffee more thoroughly before sending it to Singapore than to Port Dickson. 2.—Having to pay from Port Dickson to Singapore some 40 per cent. more for freight on parchment and water. 3.—Having no chance of making a profit on such an establishment and reduce working cost considerably later on, as would be if we had one on the Estate or if this co-operative mill were started. He urges the establishment of a coffee-curing store at Port Dickson, saying:—If we cure our coffee in Port Dickson, there is an end to it, but if we send it to Singapore to be milled, whatever amount of care we may bestow upon it, it will take a long time before establishing there a known mark—if ever—and probably others, who take much less care with their stuff, will earn the fruits of our toils."

Aloe Fibre.

A trial of "Selburn's Patent Decorticator" was made at Colombo the other day. The machine is described as consisting of two feed rollers and a revolving drum. The rollers are fixed in towers which are fitted with springs so that any thickness of leaf can be received. The "beaters," which are similar in appearance to the cutting apparatus in a hand mowing machine, revolve against the leaf as it leaves the rollers, and, beat all the vegetable substance out of the leaf as it passes, leaving only the fibre. The latter, as it appears at an opening at the bottom of the machine, is seized and drawn out by a cooly clad in leather and sacking, this being worn owing to the acid of the leaf producing an effect on the skin similar to prickly heat. This operator appears to have an unenviable job, seated as he is amongst the peculiar-smelling pasty-looking refuse, which consists of the pulp of the leaf; and this, we were told, was of no use whatever—not even for manuring purposes. Two practised operators can work the machine which will decorticate a ton of leaf every hour.

The Colombo Tea Sales.

The *Times of Ceylon*, of 28th ultimo, reports:—To-day's tea sale was the last before Easter, and there was a good all-round demand, but a somewhat smaller supply than last week, a quantity of tea printed in the lists not having arrived. There was a slightly improved demand for Broken Pekoes and Pekoe Souchongs, which were strong to advancing upon last week's prices. Common teas were firm, and other grades were about the same as last week. The prices upon the whole were well maintained. Mr. R. E. Pineo, the new buyer

for the Canadian market, attended the sale, and remained for about an hour, but did not purchase. Our sale correspondent reports:—At to-day's public sale of tea at the Chamber of Commerce Rooms about 7,895 pkgs. = 601,737 lbs. were offered, of which about 6,355 pkgs. = 480,736 lbs. were sold. There was good competition for all sorts at about previous rates. Medium broken pekoes were rather irregular in some cases, but without quotable change. Strong liquoring pekoes and pekoe souchongs were again in good demand

Tea in Canada. The *Canadian Grocer* of 3rd ultimo refers to the "excited tea market; and says:—The position of the Indian and Ceylon tea market is an unusually striking one. A private letter from London, under date of February 18, states that 6¾*d.* is the lowest price for common Indian and Ceylon leaf and that it was expected that within a few days this same tea would be selling at 7½ to 8*d.* per lb. This letter states that there is a regular boom on in England and that it looked as if a panic was developing on the market. Another letter from England states the market has not been in such a position since 1879. Apparently, the news had not had an immediate influence in Canada. From Toronto it is certainly reported:—"The feature of the market is a development of a stronger market in Indian and Ceylon teas," but from Quebec comes the news that there has been rather more business accomplished in teas during the week, though the market is far from what can be called an active one. Demand has been principally for Japans, ranging from 16 to 18½c., some 700 packages changing hands."

Indian Tea. "Merchant" writes to the *Grocer*:—In regard to the advance in Indian tea I believe that the market is getting excited in regard to the shortness of supply in Indian tea, under a somewhat mistaken notion. I notice in your last Saturday's issue you give the quantity of teas sent direct to America, Australia, &c., for the last two months, and for the same two months in previous years, and whereas last year there was practically no increase over the previous year this year there is a tremendous increase, amounting to millions of pounds of tea, which I am informed is entirely due to a direct line of ships having commenced this year, for the first time, to those countries, whereas in previous years those countries were supplied chiefly from the London market. The result is, therefore, that there will not be so much tea required from our London stock as was required in former years. My opinion, therefore, is that if the blenders and other buyers will buy from hand to mouth, the prices will not go up—indeed I believe they will come down. I hear also, on conclusive information, that a number of brokers bought largely on their own account, and that they are trying their best to drum into the blenders the alleged fact of shortness of stock, whereas, as I have shown above, it is chiefly caused by tea being sent direct to countries, instead of their being supplied, as in former years through London.

Mr. Cameron's Report. The *Ceylon Observer* sought the opinion of Mr. E. E. Green, on the very full Report furnished by Mr. Cameron, F.L.S., to the planters of Coorg on their coffee and its enemies, particularly *hemileia vastatrix*. The Editor wanted the opinion of a *expert* on "the practical point—whether he should reproduce the whole of the Report in the *Tropical Agriculturist!*" Mr. Green wrote:—"It is a most interesting Report and is certainly worth a place in the *T. A.* The remarks on the use of shade trees are of particular interest to Ceylon planters. I believe that we should have more coffee remaining in Ceylon if partial shade *of the right sort* had been more systematically employed. And I think that most planters are beginning to realize that a light shade will be equally a necessity for tea, if it is to go on indefinitely. Mr. Cameron points out that one of the most important properties of partial shade is the conservation of fertility in the soil. Speaking of forest soil, Mr. Cameron writes:—When fully exposed by the entire removal of shade, land of the latter class exhibits extraordinary fertility *for a time*; but under the influence of full sun-light it gradually becomes less fertile. . . . . The influence of intense light induces denitrification and hence a state of at least partial sterility. My own idea of the right kind of shelter for tea is a light shade—such as given by a judicious admixture of *Erythrina* (Dadap), *Albizzia moluccana* and *Grevillea*—high up; the stems bare up to at least 30 feet—preferably 40; and the branches first meeting at that height, leaving plenty of air space below, with an evenly diffused chequered shade. Mr. Cameron's suggestions on the hybridization of coffee are of great importance to coffee planters. Some of the natural hybrids seem to show a marked immunity from leaf-disease. The pity is, that systematic work in this direction was not commenced on the first appearance of leaf-disease."

LETTERS TO THE EDITOR.

NOTES ON BUILDING.

One of your correspondents asks for notes on buildings, and I am going to give a few that may be useful and interesting. Building with bricks or stone on the Nilgiris, is generally reckoned by the "Sutheram" or 100 cubic feet.

The cost of such is as follows:—		Rs.	A.	P.
1,500 bricks at Rs.4...	=	6	0	0
Building a *sutheram*, all helps included (with mud)		4	0	0
Building with lime...		6	0	0
9 bushels or 3 *salagays* lime		3	12	0
3 cart loads or 27 bushels of sand ...		1	0	0
Thus a *sutheram* of brick and mud will cost ...		10	0	0
Brick and lime		16	12	0

The Coonoor rates are Rs.14 and Rs.20 lowest, owing to the cost of carriage of bricks which is Rs.4 per *sutheram*.

A cart carries 350 bricks, and the hire is from 8 annas to 1 Rupee per trip, according to the distance to carry.

Planters usually cut their bricks at the place where the building is to be, and so save carriage.

In measuring up, the practice on these Hills is to include door and window spaces. It is fair to do this, for the mason, who loses time plumbing and squaring a door or window space; but it appears to me to be hardly correct to allow it to a Contractor, who gets large sums for the (supposed) supply of material.

Foundation work is paid for @ Rs.6-4 per 100 c. feet, (1 anna a foot) including the supply of stone, when this is plentiful on the situation, as is most generally the case.

Plastering costs as follows:—	Rs.	A.	P.
Mud and sand per 100 s. feet	1	8	0
Lime and sand (labour alone)	2	8	0
1½ bushel or ½ *salagay* lime, @ Rs.1/4 =	0	10	0
Now the Coonoor Contractors' rate for lime-plastering is	4	8	0
Against the actual cost	3	8	0

(*i.e.*, labour Rs.2-8; lime 10 as; sand 6 as).

The Contractor will contend that he puts it on ¾ in. thick, while he puts about half inch on, in practice.

(To be continued.)

Thos. Brown.

Coonoor,
29*th March* 1899.

PEARL BARLEY COFFEE.

The heading will arrest attention, so will the sample I am sending you by to-day's post. Such is the effect of adverse weather and I have seen the same about the year 1886-87 when leaf disease first began to have most serious results on the Nilgiris. One gentleman at that time started "Roasted and Ground Coffee" to secure better value for his produce but gave it up, upon adverse reports from London and the improvement in prices that then set in.

Thos. Brown.

Glendale,
28*th March* 1899.

[The name accurately describes the size of the Coffee. The last mail advices are to the effect that the London market demands a large berry. The irony of circumstances puts this pearl-barley berry under our notice at the very time when a *bold* berry is wanted.—Ed. *P. O.*]

ERYTHRINA LITHOSPERMA.

Dear Sir,—I have seen Mr. B. Nelson's letter *re Erythrina Lithosperma* in your issue of the 25th ult., and am sorry if my unguarded remark should cast the slightest blame on that gentleman's probity in the matter of selecting seed for estates. Mr. Nelson has done so much for the acclimatisation of this valuable tree that he deserves the warmest support of every planter.

In some parts visited, while in Coorg, I found saplings growing together of at least three species of *Erythrina (E. indica, E. stricta,* and *E. lithosperma)*. They varied in height from about 6 to 15 feet, and many had shed their leaves. Such being the case, I was possibly misled in recognising what appeared to be occasional specimens of the exotic tree. The latter, as Mr. Nelson explains, is subject to considerable change under varying conditions of treatment and exposure, so that in the absence of fruit (the most constant character of the species) identification is almost impossible.

The appended description from the "Flora of British India" will show that the same difficulty has been experienced by the highest authorities. With this word of apology to Mr. Nelson for my hasty remark,

J. Cameron.

Extract from Flora of British India, Vol. II.

E. lithosperma, Blume, ex Miq. Flor. Ind. Bat. i. 209. E. Secundiflora, Hassk. Pl. Jav. Rar. 378, Benth. Pl. Jungh. 237, non Brotero.

Rangoon McClelland.—Distrib. Java; Philippines, Cuming, 1161.

A tall tree, with branchlets often unarmed.

Leaflets membranous, glabrous, greenish, the end one roundish, acute, 4 6 in. long. Racemes pillose, contemporaneous with the leaves. Calyx velvety, ¼—⅜ in. long; finally splitting down nearly to the base in two lips. Standard 1¼—1½ in. long; the limb oblong, obtuse, keel and wings subequal, ½ in. long. Pod much recurved, 4—5 in. long, broader in lower half, with a stalk reaching 1½—1¾ in. long.—Kurz (Journ. Asiat. Soc. Beng. xlii. 2, 69) says Miquel's plant is not Blume's, and that it is *E. sumatrana*, Miq. Fl. Ind. Bat. Suppl. 304. I cannot, without specimens, clearly distinguish *E. holosericea*, Kurz loc. cit. from this; its pod is unknown.

GENERAL ARTICLES.

DECORTICATION OF PEPPER.

In regard to the inquiry of a Baltimore correspondent, a U.S. Department instruction was sent to the consular officers of London, Amsterdam, Batavia, and Singapore, requesting information as to the hulling of pepper. Consul-General Osborne wrote from London:—I have made inquiries through Messrs. W H. Cole & Co., a large and well-known firm of colonial brokers in this city, and append herewith the information given by them on the subject:—Peppen shells and their attending dust, &c., are the so-called "refuse" arising from the turning of the natural black-pepper berry into white pepper and this is effected by various methods, such as soaking, liming, and by machinery, both in the Eastern markets of production and after shipment thence. The so-called "Singapore" white, as shipped from that port, is made from the fully ripened black berries as cultivated in the neighbouring islands, and the hull is removed in Singapore by hand and friction before the berries are fully dried. So-called "Penang" white, as shipped from there, is made from black berries really grown in Sumatra, but imported into the Island of Penang in a dried condition. There the berries are soaked in lime and water for some weeks, until the hull is soft, when it is removed by rubbing and washing, by both feet and hands, and is finally slightly coated with lime before shipment. Siam white is manufactured on much the same lines as Singapore, and from black berries grown in Siam. From this it will be seen that a large quantity of hulls and broken berries may and do accumulate, and they are shipped from the East in considerable quantities to the consuming markets during each season, and are used for making ground black pepper, which, though darker in colour, is not necessarily impure. In Europe, a certain quantity of the finest grade of white pepper has for years been made by hulling the Singapore and Penang black peppers, shipped in a perfectly dried state, by soaking and with the aid of decorticating machinery. It may also be desirable to point out that pepper berries left on the vines till overripe lose their hull entirely by a natural course of decay (or decortication), and become actually white pepper, which, after all, is simply the kernel of the black berry.

Consul Corey, of Amsterdam, says:—The following information as to pepper was kindly given me by a broker:—There exist in England and America a couple of factories where, more or less successfully, black pepper is transformed into white pepper. The process is unknown to me. Hulling, however, will be required, and will take place at the port of importation. At the place of production (the Dutch colonies) the pepper shrub produces both black and white pepper. After gathering, the less ripe fruits are sold as black pepper; whereas the riper ones, after being soaked and washed, are exported separately as white pepper.

The following was received from Consul Everett (Batavia):—Pepper here is hulled shortly after it is picked, at the place of production; but there is absolutely no reason why it should be so. It could be done just as well in America, and probably better. The pepper is soaked for about ten days in water; it is then taken out and trodden with bare feet until the hull separates from the seed, which it does very easily, as by that time it is soft and pulpy. American ingenuity could easily invent some less primitive way of

pressing out the seed than by treading with the feet. The pepper, when freshly picked, is red, and when hulled, the seed is quite white. If kept some time, the pepper becomes black and tends to shrivel, and when hulled the seed is gray. Sometimes this gray seed is artificially polished and treated with a solution of lime, in order to make it look white, as though hulled from fresh pepper. The sooner the pepper is treated after being picked the easier and cleaner it is hulled; but pepper can be hulled months after picking and be none the worse. It is singular that it has never been done, and it would doubtless save American importers much expense to hull their pepper in America.

Consul-General Pratt, of Singapore wrote:—The fruit grows in masses of twenty or thirty on a spike. The harvest takes place before the berries are quite ripe, on account of their greater contingency at that period. Those found ripe are set apart, to be converted into white pepper. The berries are hand picked and are detached from the stem by rubbing with the hands. They are dried by the sun or artificially on heated iron plates, and afterwards, packed in bags, are ready for market. The hulling of the berry is performed to produce white pepper, and the fresh, ripe, or almost ripe fruit is used for the purpose—the removal of the outer skin being the only difference between the two varieties. This is done by the planters at the place of production. The process is simple: the fresh-plucked berries are put in vats and allowed to steep in water until the outer skin becomes soft, when coolies tread them out, after which it is dried and bleached in the sun, and is then ready for market. Some years ago a process was patented by a pepper merchant at Penang to remove the outer skin of the dried black pepper and bleach it white by means of chemicals; but, as it was found that the price obtained (say $2 higher than that cured in the ordinary way) did not cover the extra outlay for chemicals, the practice has been discontinued.

TEA, &c., COMPANIES.

East Indian Tea Company.—Crop. Assam, 375,780lb. Cachar 225,884lb. Loss Rs.14,461-8-3, which makes the Dr. balance of P. & L account Rs 22,23?-8-8. Estimated crop 1899—Assam 376,000 lb. Cachar 248,000 lb.

Darjiling Tea & Chinchona Association. | Outturn of tea 228,540lb. Average price 9as. 3½p.

Proceeds of bark Rs.4,277-13-3. Dividend of 5% recommended. Estimated current crop 2,900 maunds.

Hudibari Tea Association.—Crop 6,050 maunds, against a minimum estimate of 6,800 maunds. Cost per lb. as. 3·17 per lb., against as. 3·41 average price 5·40, as against 5·73. Estimates for current season, 6,500 maunds tea, 50 to 60 maunds seed.

Muir Tea Company.—Outturn 1007 maund, average price 10 as. per lb. net. Recommend a dividend of 2%.

South Cachar Tea Company.—Cutturn 4664 maunds, average price 4 as 3 p. Profit Rs. 3,958-1-10. Estimate for current season 5,000 maunds worth 4 as. 6 pies per lb.

Hoolmaree Tea Co.—Outturn 195,215 lbs or 35,215 lbs over original estimate. Average price (in Calcutta) 6as. 8p., as compared with 7as. 7p. the previous year. Profit Rs 8,683-15-7. Dividend of 5% recommended. Estimated crop for current season 176,000 lbs.

Bishvananth Tea.—Packed crop 940,397 lbs. or 100,307 lbs. over estimate! Sold in London at a gross average of 8⅛d nett = 6as. 9p. in Calcutta, as compared with 9⅜d = 8as. 9p. for the crop of the previous season. Profit Rs.18,655-1-3, credited to profit and loss account, which still shows a debit balance of Rs.22,809-13-10.

Hantapara Tea Co.—Outturn 2,185 maunds, against 1,762 maunds in 1897. Average price 7¼d = 5as. 11p., against 7d. = 5as. 9p. Estimated crop for 1899, 2,900 maunds.

Gungaram Tea Co.—Outturn 2,252 maunds or 248 less than estimate. Price 8¼d. (6as. 11p.) against 8d. (6as. 11p.) in 1897. Profit Rs. 5,570-10-2. Final dividend of 2 % recommended making 6 % for the year. Estimated crop for 1899, 2,500 maunds.

Nahalma Tea Estate.—The report of the directors for the twelve months ended December 31 states that the profit and loss account shows a debit, after providing for general expenses, directors' and auditors' fees, interests on debentures, &c., of £143, leaving a deficit of that amount to be carried forward against next year. The crop obtained was 234,917 lb., as against an estimate of 260,000 lb. This disastrous result is mainly attributable to a blight of Helopeltis ("mosquito blight," "tea bug" of India), which prevailed during the closing months of the year. The average cost per pound was 5·49d., and realised 5·91d. per pound, as against the cost in 1897 of 5·27d. per pound, and an average sale price of 6·04d. per pound. The increased rate of cost is due to shortness of crop and to the higher rate of exchange, which averaged 1s. 4⅛d. in 1898, as against 1s. 3¼d. in 1897, 1s. 2 1/16d. in 1896, and 1s, 1 5/16d. in 1895. The prevalence of the blight has also tended to lower quality. The latest advices from the estate are more hopeful, and had it not been for the blight the results for the year would have been more favourable. The crop for 1899 is estimated at 260 000 lb., to cost 24·94 cents per pound f.o.b. Colombo.

The Knavesmire Tea Estates Company, Limited.—The Third ordinary General Meeting of the shareholders of this Company was held at Colombo on the 29th instant. The chair was taken by Mr. H. O. Hoseason.

The report stated:—The accounts close with a balance of R21,335·26 at credit of profit and loss account after providing for the liquidation of the remaining preliminary and miscellaneous expenses, and the Directors recommend that a dividend of 2½ per cent. be paid.

The dividend will absorb Rs.10,375, and leave a sum of Rs.10,860·26 which, after providing for Directors' remuneration and a promised bonus to the Superintendent, the Directors propose carrying forward to the new season for the purpose of meeting doubtful coast advances and extra cost of the new factory, machinery, &c. Owing to a bad flushing season the year's tea crop amounted to 302,487 lbs. only, as against an estimate of 330,000 lbs., costing 23·33 cents in Colombo, and netting 31·16 cents, this including Rs. 4,591·15 spent on capital account. The estate is reported in good order and well supplied with labour, which previously has always been a trouble. The crop for 1899 is estimated at 330,000 lbs., and the cost of production at 21·05 cents, in Colombo.

The Nebodo Tea Company of Ceylon, Limited.—The Company held its Second Annual General Meeting at Colombo on 3rd instant. Mr. Joseph Fraser, Chairman. The annual report stated:—Acreage: Tea in full bearing, 157 acres; tea 4 years old 74 acres; tea 3 years old, 136 acres; tea 2 years old, 16 acres; tea 1 and rising 1 year old, 112 acres. Forest, Waste, &c., 171, acres. Total area 666 acres. The tea crop was estimated at 130,000 lbs., and the total crop amounted to 126,840 lbs., which was sold in Colombo at an average of 33·33 cents per lb., as against 34·43 cents per lb. for 1897. Including the cost of manuring, the effect of which will be mainly seen in the current year, the cost of production amounted to 24·42 cents per lb. of tea. The balance at credit of Profit and Loss account was R12,887·50, which sum the Directors recommend to be transferred to a Reserve or Extension Fund as a set-off against the Capital Expenditure of the year.

The Agra Tea Company of Ceylon, Limited.—The report submitted at the meeting of shareholders, held at Colombo on 3rd April, stated:—

The acreage of the Company's property was given in the last report. The estimated crop for 1898 was 155,000 lbs.; but, owing to the unfavourable weather that prevailed all over the planting districts, the outturn was only 151,887 lbs., showing a shortage of 3,113 lbs. This crop realized R68,244, or 45 cents per lb. The total expenditure on Sackarawatte, as shown in the accompanying accounts, was R42,060·17, or 27½ cents. per lb. The net profits on the working of Sackarawatte estate amounted to R27,348·83, which represents over 6½ per cent. on the value of that property, as shown in the balance sheet. The balance, after writing off the balance of preliminary expenses, interest on mortgage, etc., is R14,111·03; but as the expenditure on Kalkudah estate has not been provided for, the Directors propose to carry this forward to next year's accounts. The profits of the Company being much hampered by the expenditure on Kalkudah estate, the Directors recommend that the vendors be requested to take back the property for the price paid by the Company plus the amount expended on it with interest at 4 per cent. on the latter. The Directors propose to borrow the equivalent of £1,000 sterling at 8 per cent. interest to pay the Standard Life Assurance Company for the release of the mortgage held by that Company over Kalkudah estate; the interest on the loan to be paid half-yearly.

The Pitakande Tea Company of Ceylon, Limited.—The Second Annual Ordinary General Meeting of the Company was held at Colombo on 3rd instant. Mr. Joseph Fraser, Chairman. The report of the Directors stated:—Acreage: Tea in full bearing 500 acres;

tea in partial bearing 260 acres; tea not in bearing 240 acres; cardamoms in bearing 44 acres; cocoa in bearing 100 acres; fuel trees 40 acres; forest 20 acres; grass land 207 acres; waste land, buildings, &c., 30 acres. Total area 1,441 acres. The total crop of tea secured was 409,953 lbs, at a cost of cts. 26.4149 per lb; or cts. 24-20 per lb. f.o.b. when allowance is made for manure in stock charged against 1898. An interim dividend of 9 per cent. on the capital of the Company, viz., R280,000, as it stood in September, 1898, has already been paid, and taking the unsold 53,270 lbs. tea at the estimated value of cts. 34 per lb., there remains a further balance of R7,440·05, of which it is now proposed to carry R7,000 to the Reserve Fund, making this account R27,000 at the end of December, 1898, and to carry forward to next year's accounts the balance of R440·05.

WEST AFRICAN RUBBER.

THE "KICKXIA AFRICANA."

(*By an Occasional Correspondent.*)

Kickxia Africana is the botanical name of a rubber-yielding tree, erroneously known to many, even in West Africa, as the Lagos Rubber Tree, although its commercial utility was first recognised on the Gold Coast, where it was regarded as an important source of trade long before energetic little Lagos rubbed its half opened, sleepy commercial eyes, and fortunately for itself rediscovered it when the cycling craze set the world awheel and created a demand for rubber which has always overlapped the supply and will always continue to do so, considering the number of dormant industries involving its use that will leap into activity and outpace any additional supply.

I am almost tempted to digress into describing the marvels of the West African bush, where trees yielding rubber, incredibly long bark fibre valuable timber, gums, and various sorts of oil, &c., flourish side by side with others carrying lurking death in their wood, bark, flowers, leaves, and fruit—all joined together, as it were, in weird comradeship by interlacing creepers, including the world-famed *Strophanthus*, whose seeds are almost worth their weight in gold.

It is, I think, generally admitted that the coagulated milk of the Kickxia forms the principal rubber supply of West Africa. The economic value of this supply has progressed by leaps and bounds for a few years in each of our East African Colonies, Protectorates, etc', and declined as rapidly after reaching an unexpected climax that has puzzled colonial officials, particularly those immediately connected with revenue and financial departments. The diminution in the output has been brought about not by the diversion of this particular branch of trade industry to French or German spheres of commercial, competitive activity, but by

IGNORANT, WASTEFUL, AND DEPLORABLY SUICIDAL METHODS

adopted by the Aborigines in tapping the milk from the lactiferous inner bark in such a destructive way, and at such unreasonable times, that thousands of trees have died from exhaustion, deprivation of the chance of bark healing and recuperation by unreasonable tapping, and unnecessarily deep scorings through the barks into the wood of the tree, rendering it an invitingly easy prey to a destructive grub or maggot with a predilection for the wood of the Kickxia, and a prolific fecundity that is simply astounding. Whether the maggot is the progeny of a beetle in an entomologically transitional state like the coffee borer, palm weevil, &c, I have not determined from lack of opportunity for scrutinous observation; but that it attacks the exposed wood of the Kickxia, with fatal results is a certainty, preventable by judicious tapping, as I shall subsequently show.

Besides the supply from the Kickxia,

RUBBER IS ALSO OBTAINED FROM THREE SPECIES OF VINE,

principally Landolphia, forming, however, only a sixth or seventh of the total rubber output of West Africa. Three kinds of *Ficus* also yield a commercially unimportant supply of what is called paste rubber. This is capable, however, of vast improvement, while in a milky state, by the use of the proper coagulating fluid. The rubber from the vines and ficus being comparatively unimportant, I shall confine my descriptive attention to the Kickxia which is, must be, and is easily capable of being, not only the prop but the buttress of the fast declining West African Rubber Trade Industry. It is, moreover, an easily cultivable plantation rubber, and, being indigenous, possesses reproductive advantages it would be fatuously suicidal to overlook. There are certainly excellent species like the four kinds of *Hevea* of Brazil. The *Castilloa Elastica* of South America and Mexico, and the *Ficus Elastica* of Assam and India that imbue hopes of prosperous alternatives, but, alas, delusive hopes, because the seeds lose their vitality with such disappointing rapidity. Hence what is really urgently needed in West Africa is an indigenous, easily propagable rubber that will give bushmen the minimum of trouble in planting and growing from seed *in the bush* to continually supply substitutes, growing and mature, to replace trees killed by destructive taping.

It will thus be seen that the aboriginal bushman, the tapping producer, cannot be depended upon to conserve Kickxia from the destructive effects of bad tapping. It will be conclusively seen under the heading *Seed* that the Kickxia is easily and inexpensively propagable, although the peculiarity of its comparative isolation seems to militate against the fact.

Dr. Stapf's amplification of Bentham's description under the heading Apocynaceoe in the "Flora of Tropical of Africa," is in the main, accurate. The lithographed illustration of a pair of follicles forming a supplement to the Kew Bulletin No. 106, for October, 1895, is slightly misleading. The follicles I have plucked from the tree are on an average 8 inches long and planoconvex. They split open when perfectly mature in a straight line, equidistant from the longitudinal ridges, *on the plane face*

SEED.

The Kickxia flowers in the dry or Harmattan season, simultaneously shedding its seed from mature follicles developed from the previous year's flowering. Having often donned climbing spurs and a circumferential supporting rope, I have climbed the Kickxia, remaining amongst the branches for hours watching the seed fall. This they cannot possibly do till the follicle has entirely split from base to tip; even then they float down singly to the rhythmic movement of the trees' gigantic arms in the breeze, leaving the pod first in the centre. The follicles are tightly packed with seed pointing tipwards, the reversed silky hairs attached with the basal awn pointing in the same direction. On a slightly breezy day I have seen thousands parachute down—none perpendicularly; all point downwards with the basal awn and supporting silky hairs keeping the seed in an upright position for some time, as if nature desired the radicle point to penetrate the soil. Unfortunately this interesting provision of nature to assist germination is counteracted in the dense bush by preventing under-growth and the equally deterring carpet of leaves, on which the seed invariably alights to quickly rot or abortively germinate, *out of soil*, assisted by the warm, humid, equable temperature of the dense bush. This being so, it is quite evident that hardly one seed in many million has even the soupçon of a chance of germinating to some purpose. For these reasons the Kickxia grows in singular isolation like all trees in dense forests with winged, light, delicate seed. Its capacity for reproduction, however, is great, and easily convertible into an accomplished fact if follicles were collected from trees, the seed taken from them and planted in the bush. If the different Colonial and Protectorate Governments of West Africa would only encourage the gathering of the seed, which is simple enough, and persuade the natives to give them the ghost of a chance of germinating *in soil in the bush* I am fully persuaded that within seven years from the initiation of this precautionary measure, they will have

RE-CREATED A RUBBER INDUSTRY

that will not only prove a reliably constant source of reactive revenue, but will soon outrival the everlasting palm oil and palm kernels that have reached and declined from the zenith of remuneration owing to cheaper substitutes and the volition of industry requiring their reduced use to Belgium, Germany, and America.

The Gold Coast colony, with tracks, paths, and roads into the interior, has special facilities for coming in contact with rubber-gathering bushmen, and being handicapped for want of waterways, bulky produce like palm-oil and palm-kernels are with extreme difficulty conveyed to the coast. Rubber, on the contrary, is extremely valuable for bulk and easily transportable, and short of present or prospective demand must for the keystone of the industrial arch of this colony—a suggestive arch, pregnant with pathetic meaning; an arch whose stones have been cemented together by the life blood of Englishmen who have sweated in the

world's valley of Death pursuing various careers in trade and in Government service. It is to be hoped that this colony in particular will be successful and avail itself of the hopeful prospect of inducing bushmen to sow the seed of the Kickxia, which flourishes in the interior. The process is simplicity itself, as it involves only clearing the bed of leaves, loosening the soil for a foot in circumference to the depth of a couple of inches, and dropping two or three seeds on the loosened bed. The seed will germinate rapidly, the seedling grow quickly, and take care of itself in the bush.

The seeds, if carefully kept, preserve their vitality for a considerable time, thus, possessing an incalculable advantage over the short-lived seed of other good rubbers, particularly for plantation purposes. Being only six to seven inches long and delicately spindled, they pack into a conveniently small compass, rendering it possible to send tens of thousands by parcel post ridiculously cheap. I know for a fact that the soil and climatic conditions are eminently favourable in the Straits Settlements and over vast areas in Ceylon, Lower Burmah, Assam, and other places in India, it is possible to utilise the services of splendidly-trained, efficiently-equipped, and thoroughly-organised forest departments.

SOIL.

The Kickxia thrives best in a sandy clay, with a subsoil of clay. I have seen it flourishing in stiff clay, but with feeders only partially buried. Of course, under the latter condition the damp, dark shade of the bush is necessity. In quite a number of clearings in West Africa I have seen it growing luxuriantly as a sapling in loose, friable sandy loam, although I must admit it had a tendency to be rather branchy, remediable, however, by judicious pruning. I should say the ideal soil for a plantation would be a loose sandy clay, with more sand than clay, and a subsoil of clay, so that during the warm dry season the latter would act as a reservoir, supplying requisite moisture by capillary attraction.

PRUNING.

In the bush, the growing sapling sheds its primaries till it practically overtops the closely surrounding forest growth, 70 and often 80 feet from its base. At this elevation I have seen quite a number of trees throw cut their gigantic arms. Nature, more by surroundings than by heredity, if I may say so, seems to prune it in the bush in her own incomparable way to ensure a splendid trunk surface for tapping. When it grows in the open, artificial pruning becomes necessary. As the desideratum is to have a good trunk height or tapable surface, unnecessary primaries should be pruned away close to the stem, leaving a sufficient number with concomitant leafage to form new wood. The Kickxia is also capable of being stumped, even when pretty old. Should the tree be hopelessly irregular, stumping should be resorted to, but only in the rainy season, when its roots, with the assistance of moisture, adequately help in the preservation of old and the formation of new wood. All but the best sucker or shoot should be pruned away, care being taken to tar the exposed wood, to prevent the destructive incursion of the grub or maggot.

TAPPING.

Assuming that the tree has reached maturity, systematic tapping is necessary or rather essential to get a reliable annual supply of rubber; the best way to do this is to make a longitudinal conducting channel up the trunk from the base. It must be recollected that this is only a conducting channel to capture the milk from oblique, transverse scorings in the bark. The scorings into the bark resemble the letter V, forming angles where they meet the conducting channel of approximately 45°. Rectangular scorings would facilitate the milk flowing down the trunk irregularly instead of all into the conducting channel and straight down the trunk into the receptacle placed at the base of the tree to collect the milk for coagulation. It stands to reason that the oblique transverse scorings and conducting channel should be respectively continuous, otherwise there would be a diversion and consequent waste of milk flowing away at the points where they are disjointed. For this reason a *machete*, even in the hands of a skilful European craftsman, would be almost useless, leading to independent cuts and not continuous scorings, considering that the operator must be in an unstable, wobbly position, like Mahomed's mythical coffin. Anyway, he must be above *terra firma* where his *machete* or knife stroke can produce continuous and conterminous scorings, but must necessarily be disjointed and fluky. The inner bark should never be cut deeper than a quarter of an inch, as this is amply sufficient to drain away enough milk from the tree and facilitate the healing of the bark, which may be safely accelerated by the application of what I may call, with every apology to the medical profession, an antiseptic plaster, composed of one part of quicklime, two parts wood-ashes, and five parts clay. This not only excludes the oxygenic, deteriorative action of the atmosphere, but, what is more important, precludes the depredatory entry of the dreaded grub or maggot. If this system be adopted an annual supply is certain, and the conservation of the tree ensured. Moreover, the oblique scorings could be made less than a foot apart, without in any way retarding the complete recovery of the bark or hindering recuperation, which would be so rapid as to enable the tree being tapped again the following year. It is advisable, however, that the scorings should be fully a foot apart, tapping being done a month or so after the commencement of the rainy season. This would leave a good wet period for rapid, healthy convalescence, and complete recovery before the advent of the ensuing dry season.

YIELD.

The Kickxia, when treated judiciously, yields between three-quarters and a pound of rubber for every year of its age—that is, a tree twelve years old could be safely depended upon to yield nine pounds of rubber.

VALUE.

A pound of Kickxia rubber, properly coagulated, should realise at least 2s. 9d. auctioned in open market in London. The milk, when procured clean and allowed to coagulate itself, realises 2s. a pound.

Trade rubber, adulterated by the bushmen to mendaciously increase its weight, and soaked in water by traders for the same reason, fluctuates in value from 1s. 6d. to 1s. 9d. a pound. When the proper coagulating fluid is used condensation is more homogenous, so to say, that the result a compactly welded mass of rubber, with no air chambers and holes full of uncoagulated milk. By soaking the bales or cakes as they are brought to his factory in water the trade generally converts the uncoagulated milk into a putrid-smelling liquid.

I am positive it is well worth the while of all West African Governments to interest themselves in the easy bush culture of the Kickxia, as trees are being destroyed very rapidly by unavoidable, deplorable, primitive tapping, which cannot possibly be avoided, as I have shown, but can be remedied as indicated by providing growing substitutes to replace facts dying trees. Moreover, the manner of replacement is simplicity itself. I strongly advise sticking to the Kickxia in West Africa It must be borne in mind that seven eighths of the rubber exported comes from the Kickxia, the growth of which it is imperative to encourage as a means of reviving a remunerative and, consequently, revenue yielding branch of trade.—*Commercial Intelligence.*

OTTO OF ROSE.

The *Chemist and Druggist* says:—There is no article which is more precarious than the expensive scent which we import chiefly from the Balkans. Last year's crop was good, and prices were low, so low that we fear the effect upon the Bulgarian peasantry will be deplorable. Up till a few years ago the Bulgarian peasant otto-distillers did not dream of sophisticating their produce, any "mixing" that was done being accomplished by exporters. Now, however, the peasants (who, after all, are half Orientals) have learned to increase the yield by putting something else in the pot than rose-leaves, and although last year an improvement in this respect was noticeable, still there was a great deal of adulterated otto left in the hands of peasant distillers here and there. Several houses have become noted for the purity of their otto, and these we understand had bought all the pure stuff from the peasant distillers, and this was concentrated into a few hands in Kezanlik. Holders have been anticipating a demand, with probably higher prices, for business has been quiet this year, and a 10 per cent. advance is actually spoken of; but we now learn from a correspondent out there that last week an important buyer appeared in the market, and instead of buying the pure otto available in Kezanlik, the agent went to peasants in several districts and made purchases equal to 1,000 T. oz., at 10s. to 14s. per T. oz. Our correspondent gives us the name of the firm (which we prefer not to mention at present), and adds:—

All the distillers of pure otto, as well as the jobbers and some of the principal firms in Kezanlik, are horrified by the conduct of the firm, especially as this firm export their otto to France, Germany, England, and America, with the recom-

mendation of "extra fine." I may say that at present the weather is going favourably for the rose-trees, and it is almost evident that next May we will have a fine crop. Towards the end of March all the pure otto which is in the hands of the jobbers at Kezanlik will be bought up, as the principal local firms have during the past week begun to buy pure otto from the jobbers at a price varying between 19*s.* and 21*s.* the T. oz.

The otto-trade is quiet in London just now, one enterprising Kezanlik house having some time ago filled up many of the principal buyers. This house is amongst those who have been buying well in Kezanlik during the past fortnight. *Verb. sap. sat.*

* * *

The following is a report of how things are managed in Bulgaria.

Rose-gathering in South-Eastern Europe commences in May says the *Chemist and Druggist*. This year's crop is likely to be a good one. The rose is grown commercially in many parts of the world, but Bulgaria and Roumania are the chief producing-centres. The Balkan region is the rose-garden of the world. A large garden it is, one district 120 miles long by 40 miles wide being one vast rose-field. The rose-shrubs mature in three years out there, and continue to give prolific crops for five years longer, when the quality and the quantity of the flowers begin to deteriorate, then they are rooted up. The harvest lasts about eight weeks (from the middle of May to the middle of July), and gives employment to many thousands of people, mostly women and girls. The plucking of the flowers begins at daybreak, when the dew is on the leaves, and is continued until 10 or 11 o'clock, or during cloudy days all day long. When the sun is shining brightly, labour is discontinued toward noon as otto made from roses gathered during the heat of the day is inferior.

Each picker carries a 2-bushel basket, and when they are full, the baskets are emptied into sacks and transported to the distilleries. It is estimated that a garden of one acre will produce 100 lbs. of roses every morning for three weeks or so.

The distilleries are in most cases mere sheds, but are sufficient for all practical purposes. Sometimes the walls are of brick, and occasionally of wood. On one side stand the stills in rows. These are copper alembics about 3 feet in height, with a brick furnace underneath. Each still has a capacity of 20 gallons, but for a charge only 15 gallons of water and 22 lbs. or so of roses are used. The first distillation lasts an hour and produces only rose water. This is returned to the still with a fresh supply of rose-petals, and on this second and subsequent distillations the water carries with it more otto than will remain in solution, so as the distillate cools the otto separates, floats on the surface, and is subsequently removed. Some kinds of roses produce otto in greater abundance than others, and it has been found by experience that the season has much to do with the quantity of otto, a humid spring with intervals of warm sunshine causing the petals to yield more liberally than is the case in a dry, hot reason. In Bulgaria it is estimated that 3,000 kilos. of rose-leaves produce 1 kilo. of otto, and this yields of about 2½ acres. In France the production is about the same and it is computed that about 400,000 roses are necessary to produce 1 oz. of the oil. In Algeria the roses are much less productive, but in Cashmere it is estimated that from 1,500 to 2,000 lbs. of petals produce 1 lb. of otto. Only the red rose is used for otto; the white and yellow varieties, if as fragrant, are not so profitable to the distillers.

THE MAKING OF GOOD TEAS.

An old and experienced tea-maker writes to the *Planter* that he is of opinion that one of the chief causes militating against the making of good teas is the existence of too much heat during the processes preliminary to firing. This may be termed an unavoidable cause under present existing circumstances, and is not due to any negligence on the part of managers or tea-makers. Just consider, he writes, the utter unsuitableness of our present style of factory buildings. Our tea-houses instead of being cool, dry, airy buildings are, for the most part, huge, hot, stuffy structures,—the very reverse of what they really should be. True they are magnificent edifices, but, what I contend is that their construction is faulty, in so far that necessary provision is not made for keeping their interiors at a low temperature. The design of their internal compartments requires in the majority of cases complete alteration. For instance, the dryers instead of being placed in some distant part of the building and entirely cut off from the rollers are more often than not placed in close proximity. The consequence is that the leaf, which gets greatly heated in the process of rolling receives an additional amount of heat from the dryers. If there is any one thing inimical to the making of *good* teas, it is *heat* in the preliminary processes before the leaf is fired. If there is one thing essential in the primary manipulations, it is *coolness*; yet, according to our present methods, we go dead against this very obvious fact

Under our present systems in vogue, the leaf, from the very moment it is plucked, is subjected to heat. To start with, the pluckers *jam* the leaf into baskets, as tight as they possibly can, result—, a heated mass of leaf, which, more often than not, turns *red* in the centre portion of the basket. This redness is simply a kind of fermentation, and all the leaf which has turned red or become discoloured is more or less putrid, which is evident from the nauseous smell emanating from it. If brought in by carts to the factory it undergoes a second heating, and arrives, especially if brought in a long distance, in a stinking condition. On arrival at the tea house it is still further heated by being spread out on trays, or mats, or hessian cloths, in lofts, into which all the hot, moist exhaust air of the dryers has been driven. This hot, moist atmosphere is killing and, instead of withering the leaf, simply *stews* or *bakes* it. Ten to one, owing to scarcity of pluckers, the leaf has not been taken off in time, and has consequently been plucked over-ripe, instead of just when ready. It is first of all, more or less, fermented in the baskets of the pluckers, and finally stewed or baked in the withering lofts, and yet good, flavoury, liquoring teas are expected to be made from such stuff. Is it possible?

Next in the rolling it is again heated; and as if this was not sufficient, it is again subjected to heat; in the last stage before firing (*i.e.*, being roasted), it is covered over with (some times enveloped in) cloths or blankets, wet or dry, as the case may be. Instead of being kept *cool* the entire time up to the point of firing, it has just received the reverse treatment. With reference to the system of oxidation (colouring or fermentation) at present pursued, (as above depicted) it is, I consider, *wrong*. To obtain the rich, bright colour (that of a new penny), so much desired and coveted what is required? Nothing more than a *gentle draught of constant cool, moist air* and *darkness*, or, as in photography, the dark room can be lighted by *ruby* or *orange* coloured glasses, excluding all rays of light, which will, by chemical action, injuriously affect the leaf during the progress of oxidation. The temperature should stand at neither more nor less than 80° F., and the moisture should be an *exact* amount (to be yet determined by experiment) just below the saturation point of the rolled leaf. If the temperature be too cold, lengthy oxidation results, which produces soft liquor.

THE VANILLA BEAN IN MEXICO.

An American Consular report says:—This bean is too well known to require a description at my hands. It is not difficult to grow, neither is it very laborious to cultivate. The district in which it is principally produced in Mexico is in the canton of Papantla, south-west of Tuxpan, about 30 miles back from the Gulf, in that section of country lying between the Nautla and Tuxpan rivers. In the forests, on the low hills of the above-named canton, it grows wild and in such profusion that the odour from it is sometimes sickening. In its wild state, it is considered common property and gathered by the natives without cost to them, except the labor of picking. A French colony, settled along the River Nautla, has gone into the cultivation of the bean pretty extensively, and seems to have improved it.

The soil on which the bean grows is a rich, sandy loam, or a vegetable mould, not too dry, and shaded—the wild by the forest trees, and the cultivated by small trees planted for the purpose. The temperature where it grows is a mean of about 85°F. for the year—never very cold and never very hot, and the altitude up to 1,000 feet above sea level.

Planting.—The bean grows on a vine larger than the hop vine but similar in its growth. Slips of the vine are planted, about three in number, at the foot of small trees, in ground prepared by spading or turning over the soil close to the tree; no other cultivation seems to be needed. These trees are planted 8 or 10 feet apart, the vine running or climbing to the top, whence it is conducted by the vine running or climbing to the top, resembling a hop field. The poles from one tree to another, ground between the trees is not disturbed. except immediately about the roots, where it is cultivated twice yearly. The vine does not produce during the first year, and very little the second, but in the third it is supposed to bear a full crop, which is about 10 to 12 ounces of first-class beans, 10 to 16 ounces of second-class

beans, and 15 to 20 ounces of third-class beans. This weight is after curing. The life of the plant is 10 years.

Gathering.—From October 1 to January 1, the beans are picked or harvested, and, I am told, care must be taken that they are not bruised or packed close in large quantities, as overheating spoils them.

Curing.—Some place the beans in bake ovens, heated to about 120°F. for twenty-four hours; after that they are placed in woollen blankets and exposed to the sun—that is, the blankets are exposed, the beans being covered by them. Others tell me that the beans must be dried in the shade and never exposed to the sun, because such exposure would damage them by discoloration.

Preparing for market.—After the beans have been treated as above, they are made up in bundles of fifty beans each, and wrapped in tin foil. The best are generally put in tin cylinders covered at both ends and holding one package of fifty beans, or about one pound each, in which condition they are considered fit for market.

Cost and price.—The people who gather the vanilla are the natives (Indians) of the country, who are paid at the rate of about 50 per cents per diem, Mexican money, without food or lodgings. Prices for labor, however, fluctuate, as it is the old question of supply and demand that governs prices.

The vanilla bean in this market is worth at present about $7 per pound, Mexican money (about $3.50 American money). This is the average price; the best is much higher and the poorest much lower. The cultivation of vanilla is considered very remunerative, and is a business easily learned.

Growing of vanilla and preparing it for market are two entirely different occupations, there being as much difference as there is in growing sugar cane and making sugar. There are about three men in the whole Republic of Mexico who seem to understand the correct process of curing the beans, and these men have made fortunes out of the business.

JAPAN TEA IN CANADA.

Replying to the remarks of Mr. Dallas, the "Salada" Tea Co sends to the *Canadian Grocer* a letter from which we take the following:—

In his letter Mr. Dallas states that we said "there were no bonded warehouses in the United States." Evidently he did not read our letter, but instead rushes into print and says rude things which are not argumentative. What we said was: "There is no system of bonded warehouses in the United States as we have in Canada"; therefore Mr. Dallas goes to the trouble of denying something that had never been asserted. There is a system of bonded warehouses in the United States, but, we repeat, not similar to that in Canada, where, practically, every merchant, wholesaler or retailer, can have a bonded warehouse in his own building. There are public bonded warehouses in the United States, but their charges are exorbitant and the American importer avoids all these by shipping his teas viâ Smith's Falls, which is as direct a line, by boat and rail, as there is. He then stores them there at very little expense, and has his choice of markets (Canada or the United States). The teas are then sold on sample and shipped to wherever they have been sold, whether it be in Chicago, St. Paul, Boston, New York, or any place else. If this is not a fact would Mr. Bernard or Mr. Dallas come out flat-footed, and say that the Japan firms they represent have not had teas which were consigned to Smith's Falls, shipped from there to the United States?

According to the Canadian Government's returns there were 1,695,172 lb. of tea exported from Canada to the United States between July 1, 1897, and July 1, 1898. A very small fraction of this was China green and black teas, and the balance was Japan tea. In other words, those teas were consigned to Canada and shipped to the United States when sold.

The imports of Ceylon and Indian teas into Canada and the United States during the year ending December 31, last, were 13,608,000 lb., against 11,360,000 lb. in 1897. Can any man, in the face of these figures, say that Japan or China teas are holding their own? Every grocer, every grocery clerk and every commercial traveller, knows that they are not, and every man in the business knows that Ceylon tea was scarcely known here eight years ago, and to-day there is not a grocery without it. Query.— What has it displaced?

THE NEW TEA LAW IN AMERICA.

The new tea law in the United States has come in, harsh, if not, bitter criticism from a large firm of importers. Commenting on some very stringent remarks, the *American Grocer* observes:—

The tea duty and the tea exclusion act are still in the experimental stage. It is true, as stated, that the tea law and duty has enabled holders of old and trashy teas (some of which have been held here for twenty years) to get them into consumption. There is now on the market at 22 cents per pound a tea imported over twenty years ago, and which cost only a few cents per pound. In short, millions of pounds of trash have been marketed which prior to the act was unsaleable. The tea law is the tool for cleaning up this rubbish, while the duty prevents fresh importations. In a short time all such rubbish will have disappeared.

So far as we can learn, we find a majority of the trade favor the law and believe that its benefits have been many, and that in another year or two the full good results of its operation will be attained—viz, a higher average quality and enlarged consumption. It is unfortunate that the only voice against it comes from the tea trade, and that the accusations made are not warranted by the facts. They are largely assumptions, especially the charge of a "reign of terror" existing, and that the board of experts is likely to exercise "arbitrary or tyrannical power."

Let the law and duty have further trial without attack and we feel certain that the results will be found so beneficial that it will have general support, and that it will lead to further regulation of imports of food and a duty on coffee, which would tend to raise the average quality of importations quite as much as the duty on tea has improved the quality of the imports

TEA IN RUSSIA.

The *Ceylon Observer* lately interviewed the Russian tea-buyers, Messrs. Tokmakoff and Stcherbatchoff, of the firms of Tokmakoff, Molotkoff & Co. and Stcherbatchoff, Tchokoff & Co., from whom the following information was obtained:—

The price of the very cheapest brick tea in Russia is, we learnt, about 2s. a brick, which consists of from 2½ to 3 lb., so that the average price per lb. of the cheapest tea drunk in Russia would be little more than 8d. But, Mr. Tokmakoff informed us, brick tea is very little drunk in European Russia now, in fact hardly at all; among the Tartars of Astrachan, near the Caspian Sea, it is largely used, but otherwise its consumption is almost entirely confined to Siberia.

There were, also, two kinds of brick tea known in the Russian dominions, the black and the green. The green brick tea, unlike the black, was never employed to make an afternoon beverage. When a decoction was made from it, it was always mixed up with a quantity of (to us unheard of) ingredients and transformed into a thick soup; milk, fat, tallow, and mutton chips were, said Mr. Stcherbatchoff, often thrown in and the resulting fluid was only used at meals—like ordinary soup.

On enquiry as to what classes in Russia drank tea we heard that the working men in the towns drank it whenever procurable, the drink being very popular, but no leaf teas were obtainable under 2s. a pound. The peasants in the country very seldom tasted it, the beverage being beyond their means. Several millions of the poorer people in Russia had never heard of tea to this day and would not understood its use if it were distributed to them gratis. Amongst the middle and well-to-do classes, however, the consumption was very large.

"What would be the average per head amongst those who can afford tea?"

"Ah! Russia is a large place," was the reply, "and it would be difficult to ask every man if he had drunk any tea during the year. But, yes, it is a sad thing that the Russian Government do not publish such full statistics as you have here and in London. All the figures nearly that we get about the imports of tea into Russia come from London."

Was tea-drinking likely to spread, we asked, in view of M. de Witte's (Finance Minister) policy of repressing the drinking shops. Most certainly it would, was the answer we received. The "policy" in question was the buying up of all liquor shops by the Government, and this immense piece of work had now been very nearly

completed, only a few liquor shops remaining in private hands. Liquor had consequently become far dearer than previously, and, amongst the beverages to which the people would have recourse, tea held a prominent place. But it was not this so much as the decrease of duty that would increase the sale of tea in Russia, for so few could now afford to buy it.

The duty at Odessa and the other ports was 86 kopeks per pound, *i.e.*, about 1s. 10d.—100 kopeks going to the silver rouble, which is about 2s.; on the frontier the duty was just under 1s. 1d. The smaller duty here being to encourage the transport of tea from China overland, and the consequent opening up of Siberia. When the Siberian railway is complete, however. the duty will be raised, in all probability considerably above 1s. 1d. as the railway rates will be cheaper than the present overland means of transport.

On asking how other tea than that from China reached Russia we were told that none, or very little indeed, came overland from Italy or across viâ Germany from London. Direct shipments of Ceylon and Indian tea were made to Odessa, but the quantity bought in the London market and taken round by the Baltic was about twice as much as that shipped direct from the East. The total consumption of Ceylon and Indian teas in Russia was now about 10 million lb. per annum.

Another item, interesting to learn, was that originally there was no duty in the Northern ports of the Russian Empire and that tea was actually sent from Hankow to London and thence round the North Cape to the Gulf of Obi, whence it was quietly brought into North Russia and sold cheaper than what was brought over the frontier. The tea was sent to London first and transhipped there in the months of June and July, these being the only months in which the most northerly sea on the route would be navigable. But in due time the Government found out this little game and stepped in and stopped it. Amongst the last consignments which might have got into Russia without duty was one of 14,000 lb. on board the ill-fated P. & O. steamer "Aden," but the wreck of that vessel prevented its ever reaching its destination.

In conclusion we learnt that the Russian Volunteer Fleet which conveys tea to Odessa, while also acting as troop-transports, is to be increased by several new large vessels, one of the biggest being a sister-ship to the big three-funneled "Moscowa" which was in the harbour the other day at the time of the Regatta, as seen in Messrs. Plâte's photographs. With native vessels like these the Russians will more freely convey teas to Russia; and from all we could learn, though the Russian nation as a whole are yet far from being reckoned as the greatest tea-drinkers in the world; yet amongst the better classes the beverage is highly appreciated and wherever Russians can afford to indulge it the taste grows upon them with no small rapidity. The outlook, therefore, for tea, as far as the Russian market is concerned, may even now be considered bright and full of promise.

THE NEW SIROCCO FAN.

THE LATEST PATENT.

A new fan of exceptionally high efficiency and capable of remarkable performance has recently been invented and patented by Mr. S. C. Davidson, of the well-known firm of Davidson & Co., Limited, Belfast.

In appearance it might be described as resembling a squirrel cage or a hydro-extractor set on end. It has many novel and unique features, the combinations of which are said to have raised it in mechanical efficiency far above fans of any other make or description.

Mr. F. G. Maguire, the Eastern Representative Engineer of the Company, who has recently returned from England, personally supervised a large number of carefully conducted experiments, tests, and trials with this new apparatus, and he has asked *Times of Ceylon* to publish the report hereunder given. which certainly leads one to believe that Messrs. Davidson & Co. have "struck oil."

"Having had numerous enquiries for particulars of Mr. S. C. Davidson's New Fan, I shall feel much obliged if you will kindly publish the following account of this new invention:—

The new fan has been patented in all countries in the world and is registered under the name and trade mark of "The Sirocco Fan." It can be used with equally high efficiency in the form of a pressure blast fan, as used on boardship for forced blast for boilers, for mines, tunnel ventilation, etc, etc., or as a bracket fan for the ventilation of buildings, withering lofts, etc. Among a few comparative tests for efficiency when acting as a forced or pressure blast fan, the following figures are interesting:—

Type.	Dia.	Periphery speed.	Water guage Press indication.	I. H.-P. required.	Motor.
Sirocco Fan.	10″	4,453′ p. m.	4″	0·60	Steam engine
	1′ 0″	1,800′ p. m.	7/8th″	0·22	12″ Turbine direct coupled.
Propeller ventilating ...	5′ 0″	4,650, p. m.	5/8th″	3·00	Steam engine
	5′ 0″	5,655′ p. m.	7/8th″	4·05	do.

Water gauge pressure indications up to 8″ head have been registered during experiments with the larger fans.

A special department at the Sirocco Engineering Works has been provided for testing the power required, the volumetric and pressure efficiencies of the fans, as well as the comparative efficiencies when tested against other makes of fans.

In order to obtain absolutely accurate results in testing the power absorbed in driving the fans under various conditions, an ingenious combination of dynamometers is brought into requisition in such a manner that one, a Friction Break Dynamometer, acts as a check on the readings of another, a Transmission Dynamometer, so that any undue friction or inaccuracy in the mechanism is at once detected.

An air-tight compartment with air-tight bulk-heads doors and shutters is used in testing the fans for volumetric and comparative efficiencies. This compartment is so designed that accurate readings can be taken by means of anemometers, there being no cross currents or eddies formed at the positions where the recording instruments are at work. The following figures will give some idea of the volumetric efficiency of the "Sirocco" fan:—

Dia.	Speed in rev. p. m.	Cub. ft per min. discharged.	Water guage indi.	Power.
10″	1,700	3,000	2″	0 25 H.-P.
24″	530	10,105	2″	1·06 H.-P.
30″	150	5,880	—	0·90 H.-P.
30″	390	17,016	—	2·24 H.-P.
*35″	140	12,645	¼″	0·33 H.-P.
35″	176	18,840	—	1·55 H.-P.
35″	234	21,250	—	2·30 H.-P.
35″	353	25,000	—	not taken.

* Head driven.

In addition to the above figures, many interesting tests were made, in order to compare the efficiency of a well-known make of Propeller Blade Ventilating Fan, 5 ft. in dia. = 19·64 sq. ft. area against a 35" dia. = 6·6 sq. ft. area "Sirocco" Fan. The two fans were mounted at opposite ends of the air-tight testing room, and driven so as to pull against one another out from the air-tight compartment, in fact, to compete in a tug-of-war.

The Propeller Blade Fan was driven with a periphery speed of 60 ft. per minute more than the "Sirocco" Fan, so as to make sure that it received fair play. The results were as follow:—

Type.	Dia.	Area of fan in sq. ft.	Volume of air discharged.
Sirocco fans ...	35″	6 681	14,400 c. ft. p. m.
Propeller ventilating ...	5′ 0″	19· 64	Nil*

* 14,400 cubic feet of air were pulled through it in the opposite direction.

Among a few of the most interesting and novel features of this invention the following are worth mentioning:—

1st.—The eye or inlet to the fan is of equal diameter to the fan itself, therefore a 10″ fan will fill a 10″ diameter pipe, and 6′ 0″ Fan, a 6′ 0″ pipe.

2nd.—The speed of the air discharged at the fan periphery is 1·75 times that of the speed of the fan periphery itself. Thus a Sirocco fan driving with a periphery speed of 1,000 ft. per minute will discharge its air at a velocity of 1,750 ft. per minute.

3rd.—The Sirocco fan when working at high or low speeds is absolutely free from thrust, the theoretical thrust being automatically absorbed by the fan itself. If a fan be driven at, say, 1,000 revs. per minute, and is discharging, say, 50,000 cubic feet of air per minute, it can be moved backwards or forwards in its bearings

by the slightest pressure of the little finger, if the loose collars be moved. This in itself reduces the friction in driving the apparatus to a minimum.

4th.—The mechanical efficiency of the fan may be represented as 95 per cent; 100 per cent. being the full theoretical efficiency. This efficiency is computed by comparing the theoretical power necessary to move a given volume and weight of air at a given speed, with the indicated results when moving the same volume and weight of air at the same speed by the fan.

Thus the Sirocco fan is practically theoretically perfect, as a small percentage of mechanical power must always be absorbed in overcoming the friction of the bearings, and in driving the fan itself.

5th.—If the fan be driven backwards, the "power absorbed" and the "work done" are practically nil, there not being as much draft created as would move a handkerchief if held stretched out in front of it, and the fan can be turned at a high speed by the hand with little exertion. If however it be turned forwards, the "power absorbed" and "work done" can immediately be felt, and, by comparison when hand driven, one would imagine it were revolving in in treacle. This in itself is a negative proof of the high efficiency of the fan.

The writer was much amused by the remark made by the vendor of a well-known fan in London, a few weeks ago. After making an examination of the fan, which was electrically driven, the current was switched off and the fan allowed to continue running on its own account. The writer remained fully 15 minutes in conversation with the vendor, after the motive power had been cut off, but the fan kept revolving at a good high speed all the time, whereupon the vendor remarked: "Does not that fan run beautifully, no friction, etc." The writer remarked that it did; but he wondered how much work it was capable of doing "if it could spin round for so long with no driving power whatever" Perhaps it is spinning round still and continues to delight the heart of the gentleman who expounds its advantages to the public.

The Sirocco fans are now being constructed from 5″ dia. upwards. The little 5″ fans put through as much as 1,000 cubic feet of air per minute. The sizes run in fives; thus the sizes following the 5″ are:—10, 15, 20, 25, etc.

Any further particulars or figures regarding the practical working of the Sirocco fan may be had on application to Messrs. Davidson & Co., Ltd., Colombo.—I am, &c.,

F. G. MAGUIRE.

SIROCCO DEPOT, COLOMBO,
March 25th, 1899.

THE HALL-MARKING OF COFFEE.

The following paper was lately communicated to the *Brazilian Review*, and published under the title of "The Economical Effect of the Depreciation in value of Products for Exports":—

The present depreciation in value of Coffee and Sugar suggests the following considerations:

(a). That it is the province of the Foreign Consumer to fix the price—the export price—of the products of any one country; or, in other words, the price will always depend on the relative supply and demand for any one such product in the foreign market.

(b). That all such export products, whilst serving their useful purpose as products, do at the same time serve the purpose of money or coin.

A bag of coffee hall-marked in Mint of Commerce to the value of 30s., 40s., or 60s. can and does extinguish foreign indebtedness to this amount as easily and more cheaply and more readily than any gold coin of these respective amounts can do.

(c). That the competition through Commerce, for such products as products, ensures that the greatest possible value shall be hall-marked on these products when serving as money or coin; in other words, ensures that their full value shall always be drawn for.

(d). That the sum total of the value of products, during any one year, that are so hall-marked as coin, is also the sum total of foreign expenditure that ought to be expended during any one year, for this is also the sum total of money or coin *i.e.*, coin current beyond its own borders, that Brazil can mint during any one year.

(e). That the well-being of every man, woman and child in the Nation is influenced, favourably or adversely, according to the amount that can thus be hall-marked on the product. If 30s. be the amount so hall-marked on a bag of coffee, then every one finds money scarce and life difficult. If 60s. be the amount, then money is plentiful and life easy.

From the above we seem to arrive at what appears a paradox, viz.: that a nation has to submit to foreign imposition as regards its own products; but this is no paradox for it has to consult the wants and wishes of foreign consumers as to the kind of products that is, for itself, most profitable to raise, and even then it has to submit to the valuation of the foreign consumers as regards the gold value of its products when raised and ready for the market. It has to accept this foreign valuation and make the best of it.

There seems at present to be some disposition to think that the Government can influence the hall-marking by Commerce of the value of products as coin, but, fortunately, the power of the Government to intervene in this matter is nil. Here no printing-press can work The Government equally with the Nation at large must accept the inevitable and cut its cloth according to the length of its purse.

It seems useless therefore to suppose that the Government can influence the gold value of the products and it had better leave any such attempt alone, in the certainty, that commerce has at its command steadier and clearer heads and more delicate and efficient machinery than anything the Government can command to ensure that the products of the country shall always go to the highest bidder.

The power of any Government as regards its products can be exercised with best advantage in seeing that as little dead-weight as possible—foreign debt taxes and duties—be placed on the Agriculture of the Country; in other words, to cheapen the cost of production by cheapening the cost of living.

Fortunately there is hope that this will now be the case and that capital will be induced to join hands with labour in order to develope and increase the products of the country, but this desirable end will be only attained in proportion as production is cheapening the cost of living.

It is in this that the essential difference consists between what has been called Living Nations as against Decaying Races!

History teaches that Living Nations are those whose people jealously guard against its Government being able to impose needless fixed charges on the labour of the Nation and whose labour is therefore able to command the labour of the whole world through the cheapness of its home products.

In every case of a stationary or decaying nation it will be found that its Government has been allowed to add fixed charge on fixed charge, useless and unproductive, on the labour of the nation and has thus so enhanced the cost of home production that its labour cannot compete with the labour of other nations less handicapped by such burdens being so laid on their labour.

Coffee and Rubber may seem to contradict this general principle from the practical monopoly at present enjoyed by Brazil in these products. This monopoly may now, however, be seriously threatened through Cuba and Manilla, through Egypt and the Nile Valley. Throughout all this extent of country the policy that will now be pursued will be the enrichment of the labouring and labour-producing classes so that they in turn may become consumers.

It behoves the Government of Brazil, if it does not wish to be beaten on its own ground, to strain every nerve to place its labour under the same favourable conditions as the labour will be placed of its now possible competitors in the production of its two special products that are at present free from powerful competition.

China had the monopoly of tea! Where is this monopoly now?

QUININE EXCITED.

Quinine has had a rollicking week of business, "forging ahead like Pattison's whisky," said a 'Change frequenter the other day, but "forging" suggests too much effort for the progress of the alkaloid, and the connecting of Pattison's with quinine has an unfortunate inappropriateness. Quinine has sold and re-sold at feverish rates in the second-hand market, and is now on the border of 1s. 6d. an ounce. More noteworthy even is the fact that the German combination of makers have put up their price to pretty nearly the same figure, and, of course, the chief English manufacturers have advanced, maintaining a dignified reserve as to how much they sell and whom they sell to.

This is the result of eight weeks' influence on the situation that existed when quinine was 10½d., and we were anticipating the advance that is now a fact. No wonder timid spectators of the rush are shaking their heads and prophesying a slump. Still, there is plenty of confidence in others, and these—we must say, generally the best-informed in the subject—that we shall have quinine worth 2s. before the year is out. Even the more cautious ones, who, nevertheless, are not afraid to look facts in the face, ask one another whether we are not rapidly approaching a very serious scarcity in the supply of bark.

Of course, these thoughtful observers do not say this because of the speculation. That is really a result, not a cause of such reflections. Speculation, like it is always doing, is anticipating future events. All this buying and selling of quinine that has been going on during the last two months is merely the constant turning over of the same parcels of the article. The consumptive demand is stagnant compared with this speculative activity. All the same, the latter rests for its justification ultimately on the principle that second-hand quinine could always go into consumption at, say, 2d. per oz. below the makers' price, and a second-hand price of 1s. 6d. on this basis is really only warrantable on the supposition that makers will, shortly, either not be able to sell at all or will have to sell at 2d. above that. Hence all this selling and re-selling in view of future upward movement. No one would buy quinine to-day in the second-hand market for immediate consumption, for a better bargain could be made with makers.

But there is the usual danger in this speculation, that it may go too far; that the second-hand price may anticipate too much; or that it may go so fast that a reaction will set in and the weakness of nervous holders will cause the market to collapse at a time when it has got too far ahead of natural effects, which, if they could be awaited, would support it. And it is to answer the question whether the speculation has gone too far now that some are eagerly watching the reports as to shipments of bark, and asking, as we have said, whether all these signs of great future shortage are to be trusted.

We ask ourselves the same question, and we can only say that unless some extraordinary artificial arrangement is at work in Java there is only an affirmative answer to be given. If we turn round to all the possible places from which bark can be got we see none that is so situated as to be able to supply the market if Java falls short. That ought to be too obvious to need stating. But people talk in an absurd way about this, that, and the other country being able to bring forward bark if the price goes much higher. Can India put forth more than she did last year, when she came up to her highest year's production, and effected—nothing? She did not put bark down a fraction. Can Africa do anything, seeing that she has made the mistake of others and given all her attention to a comparatively little-needed bark, because it is easy to cultivate?

Of Bolivian cultivation there was hope once; but even here there has been disappointment, and of South America generally it may be said that bark must very considerably advance before it will be induced to collect again. We have little trustworthy information as to its stores, and so will leave alone the question how far it is exhausted. In the matter of remuneration for collection, it must be remembered that men often, once having started a business, continue it long after it reaches that point at which it is barely profitable to begin it, and the price that made bark collectors and exporters in America desist will have to be materially increased before they begin again. Those who know at what figure South American bark did not pay to collect will also know that we can go on putting up bark a great deal more before collectors will organise those arduous journeys that are required to obtain South American bark.

Ceylon is not worth thinking of, but so desperate are some in their desire to take a pessimistic view of bark, and so singular are others, that the most easily negligable factor in the situation is one on which we must spend most words. We have given our contemporaries the lead in the proper direction on this subject, but to get them to go in the right way seems futile judging by the hopeless tangle into which one of them gets itself. To talk seriously about Ceylon in the situation was, we thought, only possible in such a case as that of an acquaintance on 'Change who gravely asked us the other day if we had noticed that Ceylon had exported in the first week of February as much bark as in the whole of January. When he was gently taken in hand he explained that he did not get the Java figures—only the Ceylon! However, good was done in his case, and even something has been effected in the case of the contemporary, for we have at last managed to make it see that the German purchases and sales are the key of the situation; but this lesson has taken so long to penetrate that the learner has forgotten whence he received it.

There is left Java herself. Here it is most difficult to get at anything like an accurate figure for the possible output at present. We do know, though, that after a year of large shipments at prices lower than the present, Java is only sending small supplies to the European market, and what it is sending is better bark. The natural conclusion is that it has not got more bark to send, and this is true, unless, to come back to our earlier statement, the Java planters have been induced to do what they have never been induced to do before—*i. e.*, keep bark back when they are getting good pay for it. We do not say such a thing is impossible, and, after the recent visit of the planters' emissary, an arrangement of this kind might seem likely, but we doubt very much its having been made, and, in the absence of other information, look upon the present circumstances as leading fast to a scarcity that has never been known in the bark market.—*British and Colonial Druggist.*

MARKET REPORT.

By Mail advices of 17th March 1899.

COFFEE.

The *London Commercial Record* says:—The market opened with a rather steadier tone, and fine qualities were in better demand at some advance in prices. Subsequently the market became extremely flat, and a large proportion of the supplies at auction had to be withdrawn, the closing prices of grey and undesirable qualities shewing a further decline for the week of 2s to 4s per cwt., especially for East India, which has been very difficult of sale except for the moderate amount of colory qualities. With an advance in the Brazil Exchange "futures" at one time were stronger, and prices advanced, but during the last day or two there has been a relapse, and the latest quotations are 3d to 6d lower on the week, closing as follows:—

London	... Santos	... July delivery	... 29s 6d
New York	... No. 7 Rio	... „ „	... 5.25 cents
Hamburg	... Santos	... „ „	... 29¾ pf.
Havre	... Santos	... „ „	... 35½ francs
Holland	... Good ordinary Java	..	... 27 cents.

Imports Deliveries and Stock of Coffee in London are as follows:—

	Stock.		Imports.	
	1899.	1898.	1899.	1898.
Tons.	13830,	10717.	6320.	7697.
	Home Consumption.		Export.	
	1899.	1898.	1899.	1898.
Total tons...	2229.	2789,	3979.	3772.

The preceding figures exhibit—

In the Imports a decrease this year of	1,377	tons
Home Consumption an increase of	140	„
Export an increase of	207	„
Stock an increase of	3,113	„

Auctions this week have gone off as under:—

East India.—Of 1,542 bags offered about 320 bags sold—*Mysore*, smalls 40s, low middling 58s 6d to 62s, bold gray to colory 80s 6d to 83s 6d, pea-berry 90s 6d to 92s 6d; *Coorg*, smalls 41s, low middling pale greenish 50s to 60s, middling coloury 60s 6d to 62s, bold pale greenish 78s to 82s 6d, fine bold 91s 6d, pea-berry 85s to 97s; *Wynaad*, smalls 35s to 36s, low medium 44s 6d, to 47s 6d bold 65s 6d to 67s, pea-berry 60s to 75s 6d.

Mocha.—32 half-bales withdrawn.

Nyassaland.—11 bags bought in.

Jamaica.—Of 45 barrels 93 bags offered 17 bags sold, ordinary greenish 30s, bold dull brownish 36s to 38s pea-berry 34s.

Costa Rica.—Of 3,192 bags offered a good proportion sold—smalls 28s 6d to 51s 6d, fine fine ordinary greenish 44s, low middling 45s 6d to 52s 6d, middling to good middling blue 54s to 69s 6d, fine middling 72s to 96s 6d, good to fine bold 78s to 97s, very fine bold deep hard blue 102s to 106s 6d, pea-berry 49s to 102s.

Guatemala.—Of 4,048 bags catalogued, 1,350 bags sold, smalls 27s to 35s 6d, low middling dull green to middling colory 46s to 56s 6d, bold bright gray 64s 6d to 65s 6d, good middling brownish colory 65s, good bold dull colory 72s to 89s, pea-berry 55s to 75s.

Mexican.—615 bags mostly sold, smalls 35s 6d, low middling to middling 46s to 52s, bold 68s, pea-berry 47s to 70s.

Honduras.—8 bags sold, good ordinary pale 33s 6d.

Colombian.—2,506 bags offered and barely half sold, smalls 28s to 46s, very fine ordinary grayish to low middling greenish 43s 6d to 50s 6d, middling colory 51s to 56s, good middling to bold colory 58s to 68s, good to fine bold blue 69s to 86s, pea-berry 48s to 71s.

Guayaquil.—257 bags bought in.

Salvador.—241 bags partly sold—low middling dull 45s, pea-berry 57s.

Nicaragua.—135 bags withdrawn.

Brazil.—23 bags Rio bought in.

Supplies at auction to-day were again very heavy, 7,283 bags, &c., not including the lots postponed from yesterday's public sales. A flat market and very little business done—no demand.

Prices realized at auctions for some of the principal marks of East India :—

TEA.

China.—Auctions this week have offered 13,395 packages, which experienced a fair enquiry at about valuations. The following are the prices realised :—

boxes Canton Scented Caper 6¼d to 7¼d.
ditto new make 7d to 7½d.
half-chests Congou 7d to 10d.
packages Moning 8d to 9¾d.
ditto Oolong 8¼d.
half-chests and cases Moyune Green—Gunpowder 7½d to 11⅝d, Imperial 4d to 6½d, Hyson 3¼d to 4d, Young Hyson 4⅜d to 7d, Sow Mee 6½d to 1s 1⅝d, Foong Mee 9⅝d to 10¾d.

Indian.—Public sales were again rather smaller, viz., 32,600 packages, compared with 35,000 packages in the foregoing week. For the corresponding period a year since 27,000 packages were brought forward. The brisk demand previously noticed continued for all descriptions up to about 8d per lb., with occasionally higher rates, while in some cases the medium grades of Pekoe also marked an advance. Broken Pekoes, on the other hand, did not receive so much attention, and quotations, eicept for the most attractive lines, were somewhat easier. Choxest parcels on the whole realised full figures, among the most noticeable being Assam: Nahor Toli OPF 2s 1¾d, BOP 1s 9d; Rungagora BP 1s 10¾d and OP 1s 9½d; Bokahola OP 1s 10d; Dejoo FOP 1s 9½d per lb. Darjeelings: Runglee Rungliot OP 1s 10½d; Dooteriah OP and BOP 1s 8d; Kalej BOP 1s 7d per lb.

A better assortment from South India was included in the catalogues, some of the invoices being of a very useful character and bringing improved results.

For 25,900 packages on garden account 9¼d per lb. was obtained, contrasted with 8¼d per lb. for 19,900 packages, and 9d per lb. for 18,200 packages in 1898 and 1897 respectively.

Ceylon.—On Tuesday, 25,500 packages were offered, versus 27,400 packages on the 7th inst., and 27,100 packages at this time last year.

Competition was spirited for both leaf and broken sorts under 8d per lb., values for which ruled very firm to fractionally dearer, there being very little whole leaf Pekoe Souchong to be had under 7d per lb. Medium Pekoes and Broken Pekoes were about steady, but fine and finest being in less request passed somewhat irregularly. The following were among the best BOP's:—Allagalla (boxes OP) 1s 9d, Henfold 1s 4¾d, Cranley and Talawakelle 1s 4½d. Wanarajah 1s 3d, Waverley 1s 2½d, Tillicoultry 1s 2¼d, and Drayton and Kotiyagalla 1s 1½d.

The average is the same as on the 9th inst. when it stood at 8¾d per lb. while in 1898 it was barely 7¼d per lb.

Java.—In the absence of business there is nothing to report. For next week 1,700 packages are advertised.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were :—

From 1st to 14th March, 1899 ... ... 8,320,227 lbs.
„ „ 1898 ... ... 8,175,543 „

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	29,285	3,280	32,565
Ceylon	24,039	1,517	25,556
Java	—	—	—
Total	53,324	4,797	58,121

Also 656 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated March 17th, 1899, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON
From 1st June to Date.

	Indian.	Ceylon.	Java.
1898-1899.	1,403,842 pkgs.	902,406 pkgs.	36,731 pkgs.
1897-1898.	1,365,514 „	955,766 „	34,951 „

33,103 pkgs. Indian
25,709 „ Ceylon
— „ Java
} Total 58,812 packages were offered in public auction this week.

Indian. The outturn of the crop for season 1898 is given by the Indian Tea Association as lbs. 152,900,233, against 148,252,408 lbs. last season, these figures, however, do not appear to include Travancore. Teas under 8d. were again keenly competed for, although over this figure the tendency was slightly easier. Averages:—"Amal. T Co. Dooteriah," 1/4; "Lebong T Co. Badamtam" and "Barnesbeg," 1/3; "Upper Ass. Co. Nagaghoolie," 1/3; "Amal. T Co. Kalej," 1/2½.

Ceylon. Teas under about 8d. were again a trifle dearer, but prices for other grades were irregular and frequently ¼d. per lb. lower. Fine liquoring Orange and Broken Pekoes are now comparatively cheap and have fallen considerably from the highest point. A private wire gives exports to U.K. for first half of month

lbs. 2,800,000, and estimates quantity available for month as lbs. 7,250,000, against lbs. 9,500,000 last year. Average for week 8·60d., against 7·05d. same week 1898.

Ceylon Tea sold on Garden Account, 1st Jan. to date 1899, 225,494 pkgs., av., 8·30d. 1898, 252,177 pkgs., av., 7·63d.

		1899.	1898.	1897.	1896.
Pekoe Soug.	(Ordinary leaf; fair liquor)	7¼d.	5¾d.	6¼d.	6d.
Pekoe	(Ordinary leaf, little twist; fair liquor)	8¼d.	6½d.	7½d.	7¼d.
Pekoe Soug.	(Rather bold leaf; indifferent liquor)	6¾d.	4½d.	5d	5d.
Pekoe	(Somewhat bold leaf; indifferent liquor)	7¼d.	5d.	6d.	5½d.

Javas were not represented, but 1,030 packages are advertised for sale on the 23rd inst.

IN THE UNITED STATES.

The market rules very firm on all low-grade teas, with trade in invoices quiet. In the primary markets India teas have advanced 1@3c. At the Calcutta public sales prices advanced at each successive sale. Advices dated February 17 state: "With a few small shipments from India the total crop will have been exported, and any addition to the crop will be necessarily small. At Tuesday's sales all grades of Ceylon tea met with a good demand, and the market remains very strong, especially for whole leaf kinds up to about 8d. per pound. These descriptions were much sought after, and previous rates were fully maintained, while occasionally prices ruled in favour of sellers. The lowest grades continue to be keenly competed for, and in cases were slightly dearer, the proportion now selling under 6d. per pound being very small. Broken Pekoes were in good supply, and were freely taken by buyers at about previous rates."

COCOA.

Large supplies were brought forward for public competition, catalogues embracing 11,430 bags. Prices were fairly firm and holders quitted 6,200 bags. Of 2,929 bags Trinidad offered 1,430 bags sold at 76s to 78s 6d for fine to superior red, 73s 6d to 75s for fair to good, 65s to 69s for good to fine pickings, and 60s to 64s for dark and broken, or about last auctions rates. Of 4,785 bags Grenada 3,700 bags sold without material alteration in values, viz., 71s to 72s 6d for good to fine red, and 68s to 70s for middling to fair. 75 bags Dominica brought 67s to 68s 6d. 193 bags St. Lucia mostly found buyers at 68s to 70s 6d for fair to good pale, being steady. Of 158 bags Jamaica only 9 bags sold at 67s 6d to 68s. Guayaquil was a little easier, 250 bags selling out of 1,115 bags offered at 72s to 72s 6d for Winter Arriba, 73s 6d for Naranjal, 72s 6d for Machala, 71s to 72s for Caraquez, and 70s 6d for Tumaco. 85 bags Jeremie, 372 bags Bahia, and 204 bags Samana retired unsold. Ceylon growth was represented by 1,509 bags, of which 630 bags sold at valuations—fine bold and medium red 80s 6d to to 82s 6d, fair to good ditto 71s 6d, to 75s 6d, bright Native 71s, good medium red 68s, mixed Native garblings 64s, and common to good pickings 58s to 67 6d per cwt. Since the auctions the greater part of the bought in lots of most growths have sold at occasionally higher prices.

PEPPER.

Black.—The market is dull in tone and value lower. The close, however, is a shade steadier on the small shipments. Singapore has been sold on the spot down to $5\frac{3}{16}$d for fair and $5\frac{1}{8}$d for grayish. For arrival 200 tons have been sold, viz., January-March shipment has been done at $5\frac{3}{8}$d, February-April at $5\frac{5}{16}$d, March-May at $5\frac{3}{8}$d, April-June $5\frac{7}{16}$d, and June-August at $5\frac{9}{16}$d.

The shipments of Black Pepper for the first half of March compare as follows:—

	1899.		1898.	
U.K.—Singapore ...	*nil*	40	70	240
,, Penang ...	40		170	
Continent		30		160
U.S.		220		20
Total tons... ...		290		420

Auctions on Wednesday offered 221 bags Singapore, of which 82 bags sold—rather dusty $5\frac{3}{16}$d, fully fair $5\frac{1}{4}$d per lb. "re-weights."

White is also cheaper, but is in better demand at the close. For arrival 100 tons reported sold; Singapore, March-May shipment has been done at $8\frac{3}{8}$d; May-July at $8\frac{3}{32}$d down to $8\frac{5}{8}$d, and June-August at $8\frac{3}{4}$d; and Penang, March-May $8\frac{1}{16}$d.

The shipments of White Pepper for the first half of March compare as follows:—

	1899.		1898.	
U.K.—Singapore ...	140	190	60	300
,, Penang ...	50		240	
Continent	*nil*			100
Total tons... ...		190		400

At public sale on the 15th inst. of 96 bags Singapore catalogued 40 bags sold—good $8\frac{3}{4}$d. 2 bags brownish Ceylon realised 8d per lb.

GINGER.

Cochin.—Holders of washed rough are willing to make concessions, but buyers still hold off, and business is practically in abeyance. Catalogues included 29 cases 481 bags, of which 29 cases sold—medium with some bold, roughly cut and scraped 58s. medium some small ditto 39s, small ditto 32s, being a considerable decline. 24s per cwt. would have been accepted for good washed rough, but there were no offers.

INDIA RUBBER.

The receipts at Para have increased, and with some pressure to sell prices have rapidly declined to 4s 3d per lb. for fine, and not much business this week. Negrohead neglected and sellers cheaper.

In auction to-day a moderate demand and quiet tone.

Para.—55 packages offered and 18 sold, weak fine at 4s 2d, week entrefine at 4s $0\frac{3}{4}$d, virgin selections with some scrappy 3s 8d to 3s $9\frac{3}{4}$d, Cameta negroheads at 3s 1d per lb.

Peruvian sells readily; 25 packages offered and 10 sold; ball, mixed to fair 3s 5d to 3s $5\frac{1}{2}$d, slab, mixed to fair 2s 10d to 2s 11d.

Mollendo sells at good prices, 59 bales sold; fine clean 4s $2\frac{1}{2}$d, entrefine 4s $1\frac{3}{4}$d, scrappy negrohead 3s $5\frac{1}{4}$d.

Penang held high, being scarce, and of 230 packages offered little sold in auction, fine picked red 3s 4d; pickings, very good at 1s 5d, fair at 1s 2d per lb.

Central American, &c., 19 packages; Mozambique, 16 bags; Madagascar, 16 bags; Borneo, 130 packages; and Assam, 25 bales retired.

CARDAMOMS.

Medium qualities sold at recent rates, but the best and lowest of the Mysores were cheaper The first supplies of Mangalores for the season were offered, and mostly sold. Some of these are of fine quality, and brought 3s 8d. to 3s. 10d. per lb. for fine bold bleached heavy, full seeded; ditto medium size, 3s. 4d.; leans, 3s. 2d; fair bold leanish, 3s. 7d. to 3s. 8d.; medium lean, 3s 3d to 3s. 5d.; ditto small and brown, 2s. 10d to 2s. 11d.; very small lean brown. 1s. 11d. to 2s.; and good bold splits, 2s. 4d. Ceylon-Mysore: fine bold pale round, 3s. 11d. to 4s. 4d.; medium ditto, 3s. 3d. to 3s. 10d.; good split, 3s. 11d.; small medium white, 3s. 2d to 3s. 4d.; good brownish longs, 3s. to 3s. 1d.; pale 3s. 3d.; ditto medium, 2s. 5d. to 2s. 9d.; small ditto, 2s. 1d.; small to medium long pale, 2s 8d. to 2s. 11d.; dry very small pale, 2s. 4d.; splits, 1s. 8d. to 1s. 10d. (very husky) 1s. 9d.; good bold splits, 2s. 4d.; and pickings, 1s. 11d. per lb.; Ceylon-Malabar: good medium pale, 2s. 3d. to 2s. 5d.; small to medium brown, 1s. 6d., 1s. 7d., 1s. 8d.; good brown splits, 1s 9d.; and long lean, 2s. 1d. Long wild Ceylons were not in request Seeds: grey, 2s. 4d. to 2s. 5d.; good brown, 2s. 8d.

QUININE.

Sulphate quinine has continued in active speculative demand, and a large business has been done, resulting in a further advance of 1d per oz. The sales reported sum up about 500,000 ozs. German (HB or B&S) at various prices—up to 1s $4\frac{7}{8}$d on the spot, at 1s 5d for April delivery, at 1s 5d for May, at 1s $5\frac{1}{4}$d for June, and at 1s $5\frac{1}{2}$d for August. The market closed yesterday with a strong tone at the highest point reached at present, and we learn that a further advance is expected. The shipments of Bark from Java for the first half of the month come 375,000 English lbs The advance in value of Bark is now 400 per cent. from the late lowest point, whilst the rise in Quinine is only 60 per cent., roughly.

The *Chemist and Druggist* says:—The speculative movement has continued cautiously since our last. There is now a disposition to proceed with deliberate circumspection, but the position is undoubtedly firm, and an advance of 2d. per oz. by the manufacturers has helped to tone it up. As to the advance it may be noted that manufacturers are exceedingly busy.

The *British and Colonial Druggist* reports:—A week of excitement activity has passed. One of the earliest occurrences after the issue of our last report was the advance of the German manufacturers' price to 1s. 5d. for the sulphate in bulk and in 1,000 ounce lots. Next day Messrs. Howards and Sons advanced their price, making the sulphate 2d. per oz. dearer; that is 1s. 8d. in 1 oz. vials, less 1d. for 1,000 oz. lots. The prices of Howard's quinia and salts, other than sulphate, were put up to the following rates:—

	s. d.		s. d.
Quinia	2 9	Hydrobromate ..	2 6½
Arseniate	2 4	Hydrochlorate ...	2 3½
Benzoate	2 5½	Salicylate ...	2 3½
Bihydrobromate ..	2 6½	Salicylate (physiologically pure)	2 7
Bihydrochlorate	2 5½	Valerianate	2 6½
Citrate ...	2 4		

These changes took place before the end of the week, which closed with an estimated speculative business in the second hand market amounting to a turnover of about 450,000 ozs This week up to going to press sales already are calculated to have exceeded the amount just named. The second-hand price has advanced to 1s. 5d. spot, April delivery 1s. 4⅞d., May 1s. 5d., June 1s. 5⅛d. and August 1s. 5½d. The sensational report to-day is that a 10½ cents unit has been paid in Amsterdam for bark this week.

CINCHONA.

The shipments from Ceylon from January 1 to February 21 were 100,859 lbs., as compared with 107,881 lbs. at the corresponding period of last year. The Java shipments from February 28 to March 15 are reported to be 350,000 Amst. lbs., a slight improvement upon last month, but the information is chiefly valuable as showing the keenness of the crisis, fortnightly returns being rarely interesting. In auction, 93 packages offered; 74 sold; fair bold Calasaya, country damaged, sold at 9d per lb, and sound Maracaibo at 3¾d., aud damaged at 1½d to 3½d., according to class. Dark chippy red Guayaquil sold at 2d. to 4d., and East Indian chips, valued at 2¼d., were bought in at 6d. nominally.

Amsterdam bark market.—At the cinchona bark auctions in Amsterdam next Thursday, 6,846 packages, containing altogether 1,174,845 English pounds of bark with a content giving 51,555 lbs. of quinine sulphate, or an average of 5·26 per cent. for the manufacturers' bark, against 5·39 per cent. at the February auctions, 5·26 per cent. at the January auctions, and 5·21 per cent. the average of the 10 auctions in 1898. We show the division of the bark below:—

	Manufacturers' Bark.	Druggists' Bark.	Total.
Weight of bark	385,474 kilos.	151,602 kilos.	537,076 kilos.
Weight of quinine sulphate...	20,279 kilos. (5·26 per cent.)	3,291 kilos.	23,570 kilos.

The world's consumption of British Grown Tea has at last overtaken production, the total exported from Indian and Ceylon during 1898 having been some 2½ millions below the total quantity used. The difference during each of the past six years is shown in the following table:—

	1898.	1897.	1896.	1895.	1894.	1893.
Export from Countries of Production ...	276,437,473	268,865,989	253,141,438	233,834,519	213,003,480	207,451,656

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittance, should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday the 21st instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

SEASON REPORTS.

Kotagiri. *13th April* 1899.—Easter week rain has been general and brought out the blossom on which rain has unfortunately been falling steadily all this week, but where crops have been late or trees have not pruned out well and spike has not been so forward, the heavy thunderstorms of this week are not only not injurious, but will bring out a good show of flower, when it is hoped this abnormally long spell of very wet weather for this time of the year will be over.

During Easter week we had in. 4·79 in the station. Already in. 4·13 have been recorded this week. Rain continues to fall every day in heavy showers, last night being still very stormy. In the District around the rainfall has been as heavy, in parts heavier.

Last of crop coming in; prices for Black, strippings, ranging from Rs.2, @ 2-8 per bushel (heaped) some sales recorded @ Rs.2-6 per cut bushel. The labor is being paid off as pruning gets completed. We have to make 2 tons grow where only 1 grew before, and that on reduced expenditure, to come out right side up this coming season.

BRAZILIAN COFFEE.

The Cost of Production.

Estimates of the cost of placing Brazilian coffee on the market naturally vary very considerably. Still, such figures as are available afford at least some idea of cost, and thus help us to judge how this compares with current selling prices. According to figures given by the Brazilian Minister of Finance, to place in the market an arroba (32·38lbs) of coffee, type No. 7, the planters in the State of Minas, where the mean production is calculated at 30 arrobas (say 971½lbs.) per 1,000 trees, spend approximately, including harvesting, care of trees, wages in preparing land during the year &c. calculating that 100 litres of coffee in berry (? in parchment) produce an arroba of prepared coffee:

	Reis.	Or say
Harvesting, care of trees, wages, &c.	5,000	4*s* 2*d*.
Drying and "beneficing"	900	9
Carting to Station	500	5
Freight	1,900	1 7
Carting from station	200	2
Commission on sale, 3%	390	4
Import	436	4½
Total cost to planter	9,326	7·9¼

The returns to the planter are given as reis 13,000, thus showing net profits of reis 3,674 or about 3/0¾*d*. These figures were compiled when the milreis was quoted in exchange at 10*d*, and it may be said that any fall below this means a corresponding increase of net profit. Working the figures out still further, we may say that in harvesting annually 5,000 arrobas (1,445 cwt.) the profit would be £742 10*s*., or over 10*s*. per cwt. A plantation yielding this quantity of coffee costs 100,000 milreis (say £4,125); interest on this investment at 8% 8,000 milreis (£330); amortization in 25 years 4,000 milreis (£165); leaving the insignificant sum of 5,870 milreis (£244·11.8)—wear and tear of property not counted. It is explained that in the larger part of the State of Rio de Janeiro the mean production is less than 30 arrobas (971 lbs.) per 1,000 trees, but the distance to market is less. In Espirito Santo and the South and West of Minas, in the zones that possess new coffee plantations, the mean production is 60 arrobas (1,862 lbs) per 1,000 trees. In São Paulo, according to belt, it is from 30 to 200 arrobas (931 to 6,476 lbs); 100 arrobas (3,238 lbs) can be taken as an average. The profits of this increase in production are, however, absorbed in the higher wages paid to labour. The production of Bahia and Ceará can be calculated at 50 arrobas (1,619 lbs) per 1,000 trees and the expenses are low, as labour is cheaper than in other producing States. Since the quality of coffee may be inferior to type No. 7, as it generally has been since the manumission of slaves in 1888, the price realized will be less, and the planters' profits almost *nil*. The Brazilian Finance Minister concludes, therefore, that the sale of this article even at 13,275 reis (11/0¾*d*) per arroba, or 4 1/10*d* per lb., does not compensate the planter or yield a return on his capital. This, of course, with exchange at 10*d* per milreis.

Turning to another estimate, prepared by Mr. Lacerda, we find cost of production, &c., shown as follows with respect to a plantation that will produce 150,000 kilogrammes (330,690lbs or, say, 2,953 cwt.) of coffee:—

	Milreis.	Say about £.	s.	d.
150,000 trees, at 4 milreis per tree	600,000	17	10	0
50 houses for colonists, at 1,500 milreis ...	75,000	2	3	9
Machinery, "terreiros," &c.	125,000	3	12	11
400 alqueires (88 acres) land, at 500 milreis	200,000	5	16	1
	1,000,000	£29	3	4

The cost of superintendence must also be considered, as well as the cost of harvesting, the "beneficing" or preparation for market, the transportation to Santos, &c., *viz*:—

	Milreis.	Say about. £.	s.	d.
Treatment of coffee trees, 100 m. per 1,000	15,000	0	8	9
Havesting 10,000 arrobas (say 323,800 lb.) coffee ...	15,000	0	8	9
Carting, sacking, "beneficing" &c.	10,000	0	5	10
Expense of management and general expenses ...	20.000	0	11	8
Cartage to railway station and freight to Santos at 8 m. (4*s*. 8*d*.) per bag	20,000	0	11	8
Commission (3%) and cartage at Santos	10,000	0	5	10
	90,000	£2	12	6

These figures, it will be observed, are reduced on the basis of only 14 cents per milreis, or 7*d*. They are said, however, to be very unreliable. Still, it may be added that the writer figures things out as follows:—Adding the price of sacking, the export tax of 11 per cent on the value of the coffee, shipping, export commission, freight, insurance, and (in Europe) landing and storing, insurance, bank commission, commission, cartage, discount, &c., he makes these expenses total 23 per cent. on the value of the coffee. Fixing the price of sale at 100 francs (say 80/5*d* for 50 kilogrammes) (110. 20 pounds), and deducting the cost of production at 36 milreis per bag (21/0*s*. per 132 lbs) he leaves for the producer a remuneration for his labour and interest on his capital of 28,680 reis (16/9*d*) per bag of coffee. The product of 2,500 bags would thus amount to 71,700 milreis (£2,509. 10) or 7 per cent. on capital invested. Whatever may be the fact about the figures themselves the method of calculation is misleading, for the Brazilian planter sells his coffee in Brazil and has no interest in the proceeds realized in Home markets.

The contrast between the official and non-official figures given above may only confuse the reader. If so, he will turn with a sense of relief to the following clear statement made by a gentleman whose accuracy is vouched for. The difficulty, he says, of giving precise data will become apparent when the question of site, size, number of trees, and kind planted, new and old, is considered, as well as the facts that the gold coffee prices during the last two years declined more than 50 per cent., and that all local values rest on a widely fluctuating exchange basis, Brazilian currency suffering at present a depreciation of 80 per cent. As a model for a farm he thinks that 2 milreis (14*d*) per tree in full bearing would be a moderate price at present for favourable locations, dwelling houses, machinery, and other requisites included in this figure. The expense of running a plantation of 150,000 trees is probably not above £1,025 per year, not including freight to port, which is high, cost of bags, and expenses of sale. The amount of the product would equal 65,000 to 70,000 kilos, (say 1,280 to 1,380 cwt.) yielding in Santos about 50,000 milreis (£1,750) on a total outlay of £10,250, or 14 per cent. on investment. Here we have certain plain facts; capital outlay £10,250, cost of production on the estate about 15*s*. 8*d*.; sale proceeds in Santos say 27*s*. From official figures we have already learnt that expenses of transit, &c., from estate to market are about 3*s*. 7½*d*. per cwt. so that what cost the planter 15*s*. 8*d*. may be said to yield him nett, 23*s*. 4½*d*. Out of this gross profit he has, of course, to deduct interest on capital. It will be seen however, that the figures are by no means such as will cheer the heart of the coffee planter in India, who cannot hope to "produce" at anything like the same cost per cwt.

THE APPLICATION OF FERTILIZERS.

We remarked recently on the objects of fertilization, and have now to call attention to the means by which plants get their food. In order to apply fertilizers profitably, the root systems of the different plants must be thoroughly understood. All plants are not alike in their feeding qualities. Some must have one kind of food and some another. Some must have the food placed near the base of the plant, and others farther out, so that the small feeding roots may utilize it. For example, the roots of corn permeate almost every inch of the ground upon which it is grown. The root system is elaborate, and consequently manure spread evenly all over the surface will give the best results. With strawberries, however, it is different. The roots are small and do not extend much beyond the ends of the vines and consequently, to be most effective, the fertilizer must be applied near the plant.

As a rule, any plant grown on a sandy soil has a larger and better developed root system than on heavy land. It is, therefore, advisable to grow strawberry plants on a light soil and then transplant later to heavier land. For tree fruits it would not be well to place the fertilizer near the base, as the small feeding rootlets are out toward the end of the large roots.

These are practical remarks from an American source. The application of them in Southern India must rest with individual planters. From foreign scientists and scientific farmers they may learn general principles; by their own enterprise alone can they give these the fullest possible application and turn them to the most profitable account. Many of our readers must by now have made more or less elaborate experiments in fertilization. If some few of them would but establish a system of recording and forwarding to us for publication statements of the exact form their experi ents take, the progress made, the cost of outlay on manures, &c., and the eventual results, they would not only require knowledge that would be invaluable to themselves but they would also render a very important service to their brother-planters. Above all things we want systematic, not desultory, experiment: not the haphazard experiments that leave the planter in doubt as to what the mixture really was at last that produced results noted; but the systematic search of the man who marks every change he makes as his experiments progress, and notes the exact effect of each, so that at the end he is able to say "this and this and this were what brought about the result, and the result was so and so."

COFFEE IN MEXICO.

We promised some time ago further information on the subject of coffee cultivation in Mexico. The delay that has occurred has resulted chiefly from the difficulty of making a selection from the mass of materials before us. However, we now begin with a brief statement of general facts.

The only coffee cultivated in Mexico is Arabian. Liberian has not, apparently, been tried to any extent, though perhaps this variety might be more suitable to some of the localities near the coast. Altitudes of plantations vary from 100 to 5,000 feet above sea level. An average cannot be given, as it is impossible to ascertain anything like the area under coffee at the different altitudes. Much coffee is grown at 4,000 to 5,000 feet.

One year old seedlings are planted into nurseries, where they are left for another year; they are then planted out in rows 500 to 1,000 to the acre, according to locality. The distance between trees varies according to localities, but the general system appears to favour close planting, as it is believed that closely planted trees prevent the growth of weeds and saves the cleaning. There is generally great difficulty in keeping the weeds under, and plantations are cleaned from six to eight times a year.

Shade is used to about 4,000 feet, either forest trees are left or artificial shade planted, for which banana is principally used. The use of this plant has many conveniences, especially in localities where it is desirable to remove the shade after a certain time, but no doubt in many localities the poor condition of plantations may be attributed to the use of this exhaustive plant.

The crop begins to yield the second or third year after planting out, according to locality. It is picked, pulped, washed, sun-dried and mortared by hand or machinery, and sold generally to local buyers for export.

The yield per acre may be approximately throughout the country from 1½ to 2 lbs. per tree. In Coatepec district say 700 lbs. to the acre. The cost of production may be estimated as $100 to $120 silver Mexican currency per acre up to the third year, when full crops are obtained: this is without value of lands and buildings. When in full bearing the cost of production is approximately ten cents silver per lb.

This information is given with some reserve, as the British Consul at Vera Cruz, who has kindly furnished us with data, states that there is a great lack of reliable information to be obtained on such subjects from official quarters. There is much amateur planting and, it is to be feared, some bogus planting and considerable speculation in lands. The returns of Mexican coffee are insignificant in comparison with the capabilities of the country, but under the present conditions of Mexican coffee, it may be stated that in recent years planting has been extensive, and production has increased.

The result from plantings on the coast land is still a problem. Such plantations give the appearance of being in good condition and bear heavy crops, but the bean, though larger than that obtained at higher altitudes, is of less weight and there are many blind berries.

Coffee exports from the Republic of Mexico for five years:—

Year.	Quantity.	Value
1897-98	20,355,754 kilos	$ 10,649,119
1896-97	14,817,662 ,,	,, 9,876,532
1895-96	11,463,558 ,,	,, 8,103,302
1894-95	16,512,648 ,,	,, 12,670,783
1893-94	18,866,590 ,,	,, 11,766,090

These values are silver, Mexican currency. The year is counted from July 1st to June 30th.

Owing to fiscal reforms the customs statistics are more reliable for and since the year 1894-95.

THE U. P. A. S. I. SECTION.

[*Under the control of the Secretary, U. P. A. S. I.*]

In consequence of a reference made to Mr. Jno. C. Sanderson, in London, one of the representatives of the U. P. A. S. I. on the London Chamber of Commerce, the subject of Adulteration of Coffee was to be brought before the Coffee Section of the Chamber at the first opportunity. Mr. Sanderson remarks that a Parliamentary Committee was appointed in 1896 to fully consider the question of the working of the adulteration clause in the Food and Drugs Act, that he and other witnesses advocated the enforced publication of "the proportion of coffee and other ingredients" on coffee mixtures, but that the Committee finally recommended not to adopt this system. To judge from Mr. Sanderson's remarks, he thinks official opinion on this point has not changed since 1896.

* * * * *

The following communication from the Government of

India to the Madras Government has been passed on to the U. P. A. S. I. for remark :—

"Copy of letter from the Secretary to the Government of India. Department of Revenue and Agriculture (Commercial Exhibitions), Circular No. 15-1-11, dated 25th March 1899.

"In accordance with the terms of the Resolution of the Government of India, dated 2nd March 1899. the Rules and Regulations relating to the British Indian and Ceylon Section of the Paris Exhibition, 1900, have been published in the Gazette of India and the Gazettes of Local Governments and Administrations. In the meantime the question of how the space provided in the Indian Imperial Court which is shown in the plan attached to the Rules and Regulations can be best utilized in the interests of India has been under consideration.

"The Government of India have decided to contribute to the Exhibition representative collections of forest produce and minerals. But after providing for these collections a certain amount of space will remain, and the Government of India consider that this cannot be better utilised than as a means of assisting the tea and coffee industries to an adequate and effective exhibition of their produce. It is proposed therefore to grant, free of charge, to the Indian Tea Association, and also to Coffee Planters' Associations in case the latter should desire it, such space as is available in the Imperial Court and to assist in the decoration of the court in a suitable manner.

I am further to request that intimation of the Government of India's intention may be given to the Planters' Associations of Madras, and that it may be suggested to those bodies that, should they desire to avail themselves of the offer of exhibition space, the arrangement of details might most conveniently be entrusted to a Central Committee working in London, and representing and financed by the several Associations. If this suggestion be adopted, the Central Committee might organize a coffee-room in co-operation with the tea-room of the Indian Tea Association. As the time for completing arrangements is short, I am to request that no time may be lost in ascertaining the views of the Associations concerned."

Planters interested in this matter are requested to communicate *without delay* with the Hon. Secretaries of the respective District Planting Associations of which they are members.

TEA IN 1898-99.

Messrs. Geo. White & Co.'s Annual Indian, Ceylon and Java tea report contains some very interesting remarks and statistics, and expresses an opinion that has now become general, *viz.*, that the position of tea is both healthy and promising. A satisfactory though gradual extension in the rise of the article in Great Britain, and no falling off in exports thence, are the features most noticeable in the statistics furnished, and there has also been a decline off of about 4,000,000 lbs. in shipments of tea from China to the U. K. Messrs. Geo. White & Co's estimate of supplies for 1899 is :—

India (including South India.	142,000,000 lbs.
Ceylon	97,000,000 ,,
Java	6,000,000 ,,
Leaving China to furnish	30,000,000 ,,
	275,000,000 lbs.

which should, they think, be absorbed without difficulty. They consider that owing to increased deliveries of Indian and a falling off in the supply of Ceylon, stocks are likely to be abnormally low by the end of June, and that prospects for the coming season look favourable from a producer's point of view. Planters are warned, however, that they must not all be induced by the late rise in prices of common teas to go in for coarse plucking, otherwise there will be an undue proportion of that class, which will not only glut the market but lead to a still lower average than was curre for some periods in 1898. A second note of warning struck in the hint that China may be induced to send mo to the United Kingdom than in the past twelve mont Messrs. White's comments on manufacture, &c., are giv elsewhere, and deserve to be carefully studied. So also do the 'Analysis of Crop from India.' South India has t honour of bringing up the rear in the matter of averages f the 8 months from 1st July 1898 to 28th February 189 The figures for various districts are as follows :—

Darjeeling	10¼*d*
Assam	10
Dooars	7⅞
Kangra Valley	7
Cachar and Sylhet	6¾
Travancore	6½

The average for Ceylon was 8⅛*d.*, for Java 7*d.*, for a India 8¾*d.*

MR. CAMERON'S REPORT ON COFFEE IN 'COORG

We have been requested to give publicity to the followin correspondence between Mr. Alex. M. Neilson, F.C.S., Coimbatore, and Mr. John Cameron, F. L. S., of the Goverr ment Gardens, Bangalore :—

I. From Mr. Neilson to Mr. Cameron.

Coimbatore, 25*th March* 1899.

Dear Sir,—I have read your Report on Coffee Cultivation i Coorg with much interest. There are some statements, howeve under the heading "Manures" which, I think, require explanatio

You do not mention Saltpetre at all though it is one of th chief sources of Nitrogen and the principal artificial source Potash to most S. Indian Coffee.

In European Works on Agriculture it is scarcely mentione as its price precludes its use where Nitrate of Soda and Sulphate an Muriate of Potash are cheaper In this country, where it occu naturally, it is a much cheaper and more important manure tha either of these three.

Then you do not include Dried Blood in your list of Nitrogenou Manures but mention it as a source of Potash. This is no doubt slip, as Dried Blood contains only about 1% of Potash and 12-14 of Nitrogen, which is the ingredient which gives it its value.

I should like to know, also, on what experimental fact th statement is based that "for quick effect on growth the solub superphosphates are the best, *especially the double superphospha manufactured at Wetzlar in Germany.*"

Are double supers better than an equivalent quantity of th ordinary kind, and in what way are those manufactured at Wetzl superior to the numerous other makes? I can understand th in cases when the cost of transport is very heavy the double supe might prove more economical, but only in very exceptional cas as the unit price of the phosphate is very much higher than the ordinary kind.

I have thought it better that these things should be pointed o to yourself personally, rather than through the newspapers; a this is my apology for addressing you.

II. From Mr. Cameron to Mr. Neilson.

Bangalore, 7th *April* 1899.

Dear Sir,—Owing to my absence at Mysore, I regret that yo letter of the 25th ultimo has not been answered promptly. I ha to thank you for drawing attention to the weak points in m statements about manure. Saltpetre was inadvertently overlooke although I was under the impression that nitrate of potash h been recommended and entered in the list. Dried blood is course wrongly placed, being a nitrogenous fertiliser. I have n heard that German superphosphates are in use in this countr but they are highly spoken of by continental cultivators, and I a going to try them here on coffee and other plants. Being special prepared for export to distant countries, they are worthy of tri But I can understand that their use on a large scale might seriou

ly affect local interests—a phase of the question which did not occur to me until I had read your letter.

I may tell you, in conclusion, that my report to the Planters of Coorg has no pretension to be exhaustive, and that sound criticism may be of more value, if made known to the Planters, than the report itself. It is necessary, therefore, that the omission and error pointed out in your letter should be made public. Perhaps the best way of doing this would be to publish your letter and my reply in *Planting Opinion*. If you agree to this, I shall send the letters on to the Editor.

Yours faithfully,
(Signed) J. CAMERON.

III. From Mr. Neilson to Mr. Cameron.

COIMBATORE, 11*th April* 1899.

DEAR SIR,—I have received your favour of 7th inst. (L. No. 524), for which I thank you.

I took exception to your remarks about Superphosphates because I thought it rather invidious to single out one particular make which I know to have no superiority over several other brands. I don't think the use of Wetzlar Supers would affect local interests, as it would be as easy for firms like T. Stanes & Co. to import these as other makes if a demand were to arise.

I am quite willing to have our correspondence published in *Planting Opinion*, if you think it worth while.

Yours faithfully,
ALEX. M. NEILSON.

NOTES.

Tea in Canada. Advices dated March 9th report a decidedly strong tone at Toronto, and a steady market for Ceylons at Quebec.

Coffee. Venezuela and New Grenada promise to yield only moderate crops, according to advices received by James Cook & Co., London.

London Tea Sales. No sale was held in London last week. It is probable that sales of Indian Tea will now only be held on one day, Wednesday, each week.

Tea Shipments from Ceylon. The shipments from Colombo during March are given officially as 8½ millions, while the estimate for April is 7½ to 8 millions.

Chicory in the United States. An American paper says:—Domestic Chicory is evidently displacing the foreign grown. During the calendar year 1898 none of the raw unground chicory was imported, compared with nearly 15,000,000 lbs. in 1897, and 9,000,000 lbs. in 1896. Nebraska chicory to the front.

Dry Weather in Travancore. A North Travancore correspondent reports 0.28 inch rainfall in January, February and March, yet says that in not one instance has he seen a dead tea bush. He thinks local soils are deeper than those of Ceylon, so that the tea roots get away farther down into the damp subsoil.

A Defaulter. Mr. W. L. Edmiston writes us:—"I take the opportunity of letting it be known through your popular paper that the defaulter 'Jamal-u-deen' who has been '*wanted*' by so many, and for so long, has at last been arrested. From all I can hear, he is believed to have victimized a good many planters who may now be glad to have the opportunity of settling accounts with him."

Java Coffee. Mail advices received from Hard & Rand, dated Batavia, January 23, say: "This year's Government Padang crop is estimated at 30,000 piculs interior, 5,750 piculs Ankola and Mandheling, and 1,700 piculs Ayer Banjies and Painan. The dates of the auctions at Padang for the ensuing year are fixed as follows: March 31, June 30, September 30, and December 30."

The Manuring of Tea. We quote to-day at some length from the report of the Drayton Estate Company (Ceylon), because of the interesting remarks it contains with reference to the manuring of tea. The yield per acre, the cost and the price realised are all high, and the general conclusion to which the figures point is that the manuring of tea has been found by this particular company to pay remarkably well.

Brazilian Exports. A Rio paper states that there were shipped last year from Santos to foreign countries through the warehouses of the Companhia de Docas 5,012,965 bags of coffee, 108,422 kilos of rubber, 47,274 hides weighing 1,178,881 kilos, 166.598 horns weighing 208,122 kilos, 452 tons of old iron, 89 tons of rice, 416 tons of bones, 194 tons of salt and 412½ tons of other merchandise. To Brazilian ports there were shipped through those warehouses 10,249 bags of coffee, 13 hides, 4,977 packages of beer, 5,953 bags of beans and 799½ tons of other merchandise.

The Drought in Ceylon. Before quitting Ceylon the other day Mr. J. N. Christie expressed the opinion that the late drought would not prove to have seriously affected the tea output for the present year, but said it was early in the year to form an opinion. Three months had passed in which the flush had not been very heavy, and he did not think the output would exceed the estimate, although he would not say it would be less. He had visited the estates in which he was interested, and was very pleased with the condition in which he found them, which was more satisfactory than he had expected, taking into consideration the drought.

Lantana Bug. According to the *Times of Ceylon*, Mr. E. E. Green has tried in vain so far to find a remedy for—or efficient enemy to,—"Lantana bug" which has developed so much of late, and which ought to be checked, lest unknown evils arise. He thinks that probably the latest introduction by Mr. Koebele, which has proved so effective against "fluted scale" in oranges, might do. This has now been introduced into Portugal; and our contemporary would urge that, on his way back, Mr. Green should be commissioned by Government to visit Portugal and secure a consignment for Ceylon.

Manuring Tea. The *Ceylon Observer* states that the experience of Mr. Melville White fully confirms that of Mr. Joseph Fraser as reported elsewhere. Mr. Geo. Greig, in Maskeliya and Dimbula, has also confirmatory evidence. Mr. D. Bosanquet again reports that experiments made by him during the past three years bear out the conclusions arrived at, especially as to Potash being an important element. Potash and phosphoric acid he has found quite inert without nitrogen, and nitrogen most effective often combined with a considerable proportion of potash and phosphoric Acid—more especially the former.

Quinine. London advices point to increased, if not increasing, excitement, and record a level of prices that has not previously been touched during the present decade. The last Dutch sale was probably expected to go even higher than it did, but the statistical position of Cinchona bark and quinine is so strong that no important reaction need be feared. So far the buying has been confined to speculators almost entirely; consumers, strange to say, having held aloof from the market, probably in the hope that poor Dutch sales might alter the position of the article America is said to have bought very little so far, but it is confidently expected that big orders will reach London from that quarter shortly.

Mr. E. E. Green and Lady-birds. The Honorary Entomologist to the Government of Ceylon, left Colombo on 9th instant, and is due back in September when, no doubt, he will assume charge of his appointment as Entomologist to the same Government. Mr. Green reports that the consignment of lady-bird beetles that he received by letter post was not altogether useless. He found in the moss three or four beetles and a couple of *larvæ* alive, and two beetles and one larva continued to flourish under his care—the chief food being the "green bug," though aphides generally will do—until now there are 16 lady-birds and several larvæ which Mr. Green is leaving in the well-qualified and interested care of Mr. Jowitt, of Haputale, until his return.

Ceylon and Indian Tea in America. Mr. Vincent L. Tissera, head of the firm of V. L. Tissera & Co., one of the largest tea importing houses of America, has an idea that the growing tea trade between Ceylon and India as exporters and the United States as importers might be diverted to the Pacific instead of the Atlantic Coast. At present most of the tea sent to America from those countries goes by way of Liverpool and thence across the Atlantic to New York or Montreal. There are other East Indian products which Mr. Tissera thinks should also reach America by way of the Pacific Coast, and he is profoundly impressed with the conviction that return trade could easily be built up in American products, especially in the line of mechinery and machanical products of all kinds

---

Competition with China and Japan. A scientific analysis of samples taken from large bulks of Indian and China teas imported to Australia, made by chemical experts some years ago at the Industrial and Technological Museum at Melbourne, most completely established the great superiority of Indian teas. The intrinsic superiority of flavour and strength, now that Indian tea has received a fair trial, is appreciated by tea drinkers of all classes in the colonies. "To our thinking," says the *Planter*, "instead of descending to imitating China or Java teas, we should exercise the greatest caution in sending only tea of good quality to Australia. Chinese and Japanese exporters are making great efforts to check the inroad of Indian tea in the Australian markets, and it is only by the maintenance of a high standard of excellence that India can hope to win the fight in either Australia or America."

Coffee in Coorg. The *Madras Mail's* South Coorg correspondent writes that where the past crops have been light, there will be bumpers next season; but bumpers will be the exception rather than the rule. Crops can only be fair average ones on the whole. He writes on 8th instant, and adds: "Some of the coffee blossom opened yesterday, some of it to-day, but there is a good deal of bud which will open to-morrow. There has been some talk about the appearance of the blossom not being quite what could be wished; that it was bursting prematurely or "brushing" and that some of the buds were black inside, &c. We can't expect to have everything. There was a lot of this last year, but for all that crops turned out very well. It may be that 'shuck' trees would have made more bud had the rain held off sometime longer; but there is other coffee which would have suffered. Rain for the next week is to be deprecated as clear weather is essential for the proper setting of the fruit." That "rain is to be deprecated" is a very artistic bit.

Russia's Annual Tea Imports. By the courtesy of Messrs. Stcherbatchoff, Tchokoff & Co., the *Times of Ceylon* is in a position to give the amount of the Russian tea imports for the past three years, as set forth in the *Chiney Verstnech*, a weekly market paper published in St. Petersburg. Excluding brick tea, the amounts were given as follows:—1898, 54,000,000 lbs.; 1897, 50,000,000 lbs.; and 1896, 52,000,000 lbs. The amount of brick tea, our representative was told, was to the very lowest computation an equivalent quantity to the amounts given above, and it has been freely stated among Russian merchants that the aggregate amount of tea coming into Russia for the last two or three years was as much as 140,000,000 lbs. per annum. The whole of the tea entering the country had to pay duty, the brick tea going into Siberia being charged at Irkutsk at the rate of 7/6 for 36 lbs.; upon black tea through the Marine Customs a duty of 1/10 per lb. was imposed; and upon overland teas 1/ or 1/1 per lb., according to exchange; while for green teas the amount charged was something

similar to that for overland teas, but the exact figure our informants could not at the time call to mind.

Cheap Pensions. The following from a home paper shows how much may be 'given away with a pound of tea,' even to the extent of "Pensions for widows":—"Particulars of an interesting pension scheme for widows, started by an enterprising Lincolnshire firm of tea merchants, have seen sent us by a City clergyman, who remarks that 'it looks to me too good to be true.' Every married woman, it seems, who purchases half a pound of their tea weekly for five consecutive weeks is entitled to a pension of 10s. a week in the event of her husband dying, provided he was in good health when she commenced buying the tea, such pension to be continued so long as she remains a widow. A reserve fund of a penny on every pound of tea sold has been formed, and is held in trust for the benefit of the widows by a solicitor. The circular sent us does not, unfortunately, give the present amount of this fund, but on it is printed an 'estimated yearly balance-sheet of 1,000 branches,' and here provision is made for 10,000 widows! The tea, it should be added, costs 2*s.* a pound. On the circular the names and addresses of over 100 widows are given who are said to be in receipt of pensions provided by this firm." It is safe betting that the affair is a hoax of some kind.

Mr. Cameron's Report. The Coorg correspondent of the *Planter* writes:—"The *Madras Mail* takes Mr. Cameron to task for not adducing sufficient data in support of his statement that the coffee industry in Coorg had entered the forcing stage. Possibly he considered this would be superfluous in the case of planters, who would understand. If the system of cultivation in Coorg is not forcing what else can be so called? A little manure is spread about the roots of the trees just to put a crop on them. No one can pretend that it goes any way towards putting back what has been extracted from the soil and that larger part which has been washed away. The plant food in the soil which becomes gradually available, is also gradually taken up by the trees, so that actually the soil is becoming more and more impoverished as time goes on. There must be some accumulation of phosphate of lime in the soil if what Mr. Elliot says is true that a certain number of tons of bones per acre is sufficient to supply the needs of coffee plus the shade trees for 300 years. But it is mostly bound up in the shape of square inch bones, which Mr. Pringle, the Agricultural Chemist, said would only become available in succeeding generations. If ever the debt is to be adjusted, it will be by growing the Florida bean constantly and turning it in, besides the usual manuring, or perhaps growing the *E. Lithosperma* as shade would answer equally well. Mr. Nelson says he has obtained most wonderful results from his system of coffee cultivation without manure."

The Mutations of Demand. Alluding to the constant change in trade that has been noticeable of late, the *London Commercial Record* remarks that Ceylon coffee affords an instance, Who does not recollect the fine high-grown descriptions of Ceylon? They are getting scarcer and scarcer every year. The prices realised in our market did not pay the planter, who was compelled to look for more remunerative employment and has found a splendid substitute in tea. East Indian plantation coffees are almost threatened with the same fate. The last few seasons have not paid the planters, and this year's experience is certainly most discouraging to growers, and we can hardly wonder at the disappointment and disgust they feel at the disinclination expressed in London to purchasing the so-called fine coloury East Indians. Only those of the planters who sold their estimated yield at the very beginning of the season have made money, those who held for higher prices and are now compelled to consign their crop to London will, we fear, hardly cover expenses, particularly not if their coffees are of medium or even small size. What is wanted in London at the moment is bold size coffee. There is a great scarcity of large berries, greatly owing to the indifferent quality of this season's East Indians, and anything bold fetches quite fancy prices. 'A' size realises from 20*s.* to 30*s.* per cwt. more than B. which is enormous considering that the usual difference in value is about 2*s.* 6*d.* to 5*s* per cwt. Colour is not so much required as size, and an inferior coffee, so long as it is bold, will fetch more than a fine blueish parcel of medium size berry. Our market is literally swamped with ordinary and low coffees; public sales show enormous quantities of them, and brokers find it impossible, the same as last year, to dispose of all the catalogues in one day. Prices naturally cannot be maintained, every sale almost registers a further decline, and holders, in their anxiety not to be left with stocks on their hands, assist in bringing down values to an unprecedentedly low range. The general desire, therefore, is to dispose of available stuff at any price.

GENERAL ARTICLES.

INDIA-RUBBER:

NOTES ON THE EXPERIMENTAL TAPPING OF RUBBER-TREES IN THE CHARDUAR PLANTATION, ASSAM.

Experiments in tapping 21 selected trees in compartments two and three of the Charduar rubber plantation during the years 1896-97, and 1897-98 the results of which are shown in detail in Appendix VI. of the Assam Forest Report for 1897-98, gave a yield of 23 seers in 1896-97, and of 24 seers in 1897-98. The trees experimented on have been lightly tapped, and show no signs whatever of having suffered in any way; there appears to me, therefore, to be no reason to suppose that other trees in the plantation of similar age, the oldest experimented on being over 20 years and the youngest 17 years, would be damaged if subjected to similar light tappings.

The compartments that contain trees not less than 17 years of age, that is, in which vacancies were finally filled up over 17 years ago, are Nos. 1, 2, 3, and 4. These compartments cover 318 acres, and contain 5,221 trees, as ascertained by actual counting; of these alternate trees (say, 2,600) were over-tapped for three successive years in 1889, 1890, and 1891, with a view to killing them out, as the trees had been planted too close together to admit of proper development of their crowns, on which the full growth of a tree depends. It was found, however, that no amount of tapping affected the continued growth of a tree, and the opening out of the roots showed that all the trees in these compartments had become fairly anastomosed, or, in other words, that the plantation had become practically one huge tree.

The question now for consideration is whether the systematic light tapping of all the trees in the compartments Nos. 1, 2, 3, and 4 should be carried out every year, under the personal supervision of the Divisional Forest Officer and his Divisional Forest Staff as

an experiment, and with the view to Government's obtaining some present return for the expenditure incurred in forming the plantation. This expenditure from 1873-74, when work on the plantation commenced, up to 30th June 1898, amounts to R1,67,627, or R75-8 per acre for the 2,218 acres that had been planted up to that date, including 518 acres that were disforested in 1896-97 for tea cultivation.

The present value, taking it to be the cost debitable tos the existing plantation, may be accepted as :—

	R.	Rs.
Total cost incurred up to 30th June 1898.		1,67,627
Deduct—		
Value to be recovered for rubber-trees on 518 sic) acres disforested, fixed by the Government of India at R39 per acre on 482·87 acres actually established	18,832	
Expenditure that may be written off as incurred on the experimental stage, *i.e.*, on learning how to plant rubber successfully, taken to be cost up to 1880-81 and partly up to 1882-83, up to which years almost all previous plants had to be replaced	34,000	
Sales of rubber, seed, and seedlings, 1897-98. ...	1,050	
		53,882
Balance...		1,13,745

which on 1,700 acres of plantation existing on 30th June 1898, equals R67 per acre. With the experience gained, it is estimated that future extensions will cost a maximum of R40 per acre

Tapping lightly all the trees in compartments Nos. 1 to 4, including the 1,600 that it was attempted to kill out and the 21 that have been experimentally tapped during each of the last two years, may, it is expected at a *low* estimate, give the following results :—

	Mds.	Srs.
Two thousand and six hundred untapped trees may be expected to yield annually an average of 1 seer per tree ..	65	0
Two thousand six hundred and twenty-one tapped trees at ½ seer per tree.	32	30
Total...	97	30

say, 8,000 lb., the cost of collecting which will be 8 annas per lb., or R4,000.

The value in London of the samples sent from the plantation tappings in 1896-97, through the Reporter on Economic Products to the Government of India, was 2s. 8d per lb. The report on the value of samples (21 seers) sent to that officer, the result of tappings in 1897-98, has not yet been received.

Mr W. H B Lawes, Superintendent, Bashwanta Tea Company, has kindly placed the following information at my disposal regarding the result of tappings of 121 rubber trees that were planted about the coolie lines of Dikorai garden, some 17 to 20 years ago, and have not been looked after, having been cut about from time to time by the coolies. These trees were lightly tapped by tappers supplied by the Deputy Conservator of Forests, Darrang Division, and rubber was shipped to London early in 1898.

Rubber obtained by tapping		180 lb.
Rubber sold in London		170 „
Consigned in London to Messrs. George Williamson and Company ; realised in London on 170 lb. at 3s. 3d per lb. £27-12-6 (say)	415	8
Deduct—	R	As.
Cost of tapping	90	0
Freight to Calcutta, R1 per maund (say)	2	8
Freight, Calcutta to London, and other charges, £2-2-6 (say) 3 annas per lb. on 180 lb.	32	0
		124 8
Profit.		291 0

or Rs.2-6-0 per tree.

From the above data and statistics it may be assumed that, taking the sale value of the rubber in London at 2s. 8d. per lb. as reported by the Reporter on Economic Products, the financial results of the annual experimental tappings proposed may be safely estimated as follows :

Sale value of 8,000 lb. rubber in London at 2s. 8d. per lb., at 1s. 4d. per rupee		16,000
Deduct :—	R	
Cost of tapping 8,000 lb. at 8 annas per lb. ...	4,000	
Freight to Calcutta at R1 per maund, say ...	98	
Freight, Calcutta to London, and other charges at 3 annas per lb.	1,500	
		5,598
Profit		10,402

which equals about R2 per tree, or on 318 (sic) acres, R32-11-4 per acre, and on cost per acre over nearly 50 per cent.

I have been somewhat diffident at putting forward proposals for systematic tappings for fear of eventual evil results on the capital value of the plantation as a property in which a considerable amount of Government money has been expended. I think, however, that, *given proper personal supervision by the Divisional Forest Officer and his staff*, the time has come when at least the experiment should be tried on the most mature area of 318 acres out of the 1,700 acres that have been planted up, and I therefore advocate, after having visited the plantation again, that action should be taken in this direction during the present tapping season.

A. L. Home,

Conservator of Forests, Assam.

Dated Camp Tezpur, the 10th November, 1898.

—*Indian Forester.*

TEA, &c., COMPANIES.

The **Battalgalla Estates Co., Ld.**; the **Bandarapolla Ceylon Co., Ld.**; the **Ederapolla Tea Co., Ld.**; and the **Kelani Valley Tea Association, Ld.**—have each declared a dividend of *five* per cent. per annum for the past year.

The **Burnside Tea Co., Ld.**, has declared a dividend of *two* per cent.

The **Panawal Tea Co., Ld.**, and **Yatiyantota Ceylon Tea Co., Ld.**, are each declaring a dividend of *four* per cent. for the year.

The **Pundaluoya Tea Co., Ld.**, is more fortunate than the other Companies, and its dividend is at the rate of *six* per cent. for 1898; while still more prosperous is the **Diyagama (New Dimbula) Co., Ld.** which declares an *ad interim* dividend for 1898-9 at the rate of *five* per cent.

The **Yatiantota Ceylon Tea Company, Limited** After paying the 6 per cent due upon the Preference shares and writing off £1,000 for depreciation, the Directors have recommended that a dividend of 4 per cent. for 1898 upon the ordinary share capital be paid, which will leave a balance of £779 to be carried forward to the current year.

The Talawakelle Estates Company, Limited.—The following is from the report to be presented at the first ordinary annual general meeting of the company to be held at the office of the company, 12, Fenchurch Street, E.C., on 28th ultimo :—

The mortgage of £21,500, which was being arranged when the prospectus was issued, was executed on February 21. It bears interest at the rate of 5 per cent. per annum, and the principal is repayable in fourteen annual instalments, the first of which, £1,500, was paid on December 31 last, and charged against the profit of the year. The high rate of exchange, averaging 1s. 4 3-16d. per rupee, increased the cost of production. Owing, however, to the satisfactory prices obtained for tea, the profit for the year compares favourably with that of the three years preceding, and is equal to over 12 per cent. on the cost price of the estates, after charging some £500 spent on factory extension and new machinery against revenue. The total yield was 421,284lb tea plucked off 802 acres, being at the rate of 525lb. per acre, costing about 27½ cents, or, say, 4½d. per lb., free on board Colombo. The gross average price of the 418,565lb. sold in London was 10·57d. per lb. The profit for the year, inclusive of interest, and after providing for general expenses, &c., amounts to £7,691 9s. 5d.; interest due vendors and on the mortgage, less income-tax, has been paid, amounting to £1,047 9s. 2d.; the first instalment of the mortgage of £21,500 has been paid, viz., £1,500; dividend on the 6 per cent. preference shares for the year, less income-tax, £319; an interim dividend of 4 per cent, free of income-tax, on the ordinary shares was paid on September 30, £1,482 16s. It is proposed to write off the whole of the preliminary expenses, £193 0s. 6d.; to pay a final dividend of 6 per cent. on the ordinary shares, free of income-tax, making 10 per cent. for the year, which will require £2,224 4s; and to carry forward (out of which income-tax has to be paid) the balance of £924 19s. 9d.

The Travancore Tea Estates Company, Limited.—The annual ordinary general meeting of the shareholders of the Travancore Tea Estates Company, Limited, was held at the offices of the company, 20, Eastcheap on 23rd March. The chair was occupied by Mr. H. K. Rutherford. The Chairman, in moving the adoption of the report and accounts, said:—

I happen to be in the chair to-day by the unavoidable absence of Mr. McKenzie, the chairman of the company, who is at present in America in connection with the joint enterprise of India and Ceylon in pushing British grown teas in that country. Another of our colleagues, Mr. Talbot, is absent in Ceylon where he had an opportunity of meeting our Estates Manager, Mr. Knight, and going into various matters connected with the management. Mr. David Reid's absence, I regret to say, is due to the fashionable complaint of influenza. My duty to-day does not demand of me any lengthened statement of the position of the company, as the reports and accounts explain that position very clearly. Perhaps it would be well to take the accounts first. You will note in the balance-sheet the capital issued is £70,000, or £14,500 more than it stood at a year ago. That difference arises from the 10s per share called up on the 21,000 ordinary shares amounting to £10,500, and an issue of £2,000 ordinary shares and 2,000 in preference shares amounting to £4,000, as payment for part of Pambanar Estate. There is next a sum of £1,150 15s 1d placed to reserve, which, as you will doubtless remember, represents the profits earned between the date from which we took over the properties and the date of registration of the company, and which sum was not legally available for dividend. Bills payable and sundry creditors amount to £28,443 3s 9d. The proportion of this sum which is chargeable to capital account as the bills fall due is provided for by issuing debentures against the same, and up to the present time we have issued £25,000 of debentures. On the other side of the account you will note the cost of estates amount to £91,016, and this is £31,635 more than last year—a very large sum, but necessary for the land we have opened up. This sum is made up of £11,400 for payments for land, £15,553 for new clearings and upkeep of land not in bearing, and £4,682, for buildings and machinery. In the profit and loss account you will observe the profit on sales was £2,031 or £814 less than the previous account, but which you will remember was for a period of fifteen months, so the profit is practically about the same. You will note the directors again give their services free, and that the London expenditure is remarkable for its moderation. The balance of profit is £2,358 2s 8d, which admits of the full preference dividend being paid, and leaves a balance of £241 2s 8d to be brought forward to next year. Now we cannot pretend to say this is a very satisfactory result, but when you take into consideration that the fall in the price of our tea of ¾d per lb. and the higher rate of exchange has curtailed our profits some £1,500, you will perhaps agree we have been fortunate in coming out as well as we do in probably one of the worst years the British-grown tea industry has had. The crop was unsatisfactory in quality and yield, but we see hopeful signs of better results in the current year in both of these particulars. You will note we have planted up nearly 1,300 acres with tea, which is a great deal to accomplish in one season, and great credit is due to our manager, Mr. Knight, and his staff for the work they have been able to get through, and which we are led to believe is good work, and that the clearings promise to be successful. Now with regard to our debentures, we told you at last meeting we were contemplating such an issue, and I am happy to state we have been able to carry this matter through. The debentures are for a total issue of £50,000, of which we hope only £44,000 will be required. They are repayable at par on January 1, 1904, and are only being issued as we require the money. When this issue is completed the estates, with factories, will have cost us about £32 per acre, which is a reasonable price. As to the future we are, of course, mainly dependent on the selling price of tea, and if this continues to keep about its present level, which is considerably higher than last year—1d or 1½d per lb.—I have no fear whatever but that the other important factors of yield and cheap production will not be found wanting. We can only ask the ordinary shareholders to exercise patience until the estates come into bearing, when we trust the hopes of your directors may be realised. I shall be very pleased to give any further information that any shareholder may desire to ask, and now beg to move the following resolution:—

"That the report and accounts be adopted."

The proposal was seconded by Mr H. Tod, and carried unanimously.

Mr. White then moved the re-election of the auditors, Messrs. Harper Brothers, which was seconded by Mr. Dangerfield and carried unanimously. The meeting concluded with a vote of thanks to the chairman, directors, and managers.

The Nahalma Tea Estate Company, Limited.—The fifth annual ordinary general meeting of the shareholders of the Nahalma Tea Estate Company, Limited, was held at the offices of the company, 39, Victoria Street, S. W., on 25th ult. The Secretary read the notice convening the meeting, and the minutes of last year's meeting were read and confirmed.

The Chairman (Mr. Arthur Marshall), in moving the adoption of the report and accounts, said: The report is not so good a one as we might have wished, but we must take into consideration that we have had a very bad season as regards rain, and also that the mosquito blight has for a few months been very severe indeed. But in a report we have received from Mr. Ernest Green, who is the Government Entomologist in Ceylon, he states that if properly treated the pest can, to a very great extent, be exterminated. We have accordingly advised our superintendent, Mr. Duncan, to take every possible means of getting rid of it, and we have had a letter this morning stating that it certainly is not any worse than before, and that on account of the favourable weather this season the tea that had been recently pruned has not had another attack. We have obtained a report from Mr. Anderson, stating that if it had not been for this blight the company would have done very well, and that the estate was one of the best he had seen in the Kelani Valley. This should greatly tend to reassure the shareholders, especially as they have had two bad seasons.

Drayton Estates Co.—The annual general meeting of the shareholders of the Drayton (Ceylon) Estates Company, Limited was held at Colombo on the 8th April, at 12 noon. Mr. V. A. Julius, *Chairman.*

Proposed by Mr. W. S. Forster, and seconded by Mr. H. Whitham, that a final dividend of seven per cent. making a total dividend for the year of eleven per cent. be declared and paid forthwith. Carried unanimously.

The Directors' Report stated:—

Directors:—Messrs. V. A. Julius, A. R. Wilson Wood and H. Whitham.

After providing for depreciation of buildings and machinery the balance of profit available is R52,667 57. The Directors propose that a dividend of seven per cent. be declared, making, with the interim dividend of four per cent. eleven per cent. for the year, and that the balance R2,617·57 be carried forward to next year's account.

The crop of tea secured from the Company's Estates was:—

	lb.		lb.
Drayton	402,770	Increase ...	68,432
Yuillefield... ...	77,024	Decrease ...	1,296
Cwm	31,792	do. ...	680
Total...	511,586	as against	460,000

estimated. The following comparative statement may be of interest to the Shareholders.

	Acreage.	Yield per Acre.	Acreage Pruned.	Acreage Manured.
Drayton	722	565	305	306
Yuillefield	207	384	117	37
Cwm	90	342	42	—

	Cost F.O.B Exclusive of Manure.	Cost F.O.B. Inclusive of Manure.	Price per lb.	Profit per lb.
Drayton	22·23	27·07	46·43	19·36
Yuillefield	.. 28·29	30·13	46·06	15·93
Cwm	...24·98	24·98	46·43	21·45

Expenditure for 1898 includes the sum of R20,886·70 cost of manuring 343 acres at R62·25 per acre as follows:—

	Acres.
With Artificial	268
With Bulk	35
Burying and Lining Prunings	40
Total ...	343

The estimate provided for 200 acres to cost R64·37 per acre.

The total cost of 511,586 lb. tea, including above and Cwm rent, but exclusive of depreciation, was cts. 28·30 per lb., as against estimated 460,000 to cost cts. 27. Excess is explained by cts. 4·06 being spent on manuring as against cts. 2·41, estimated, so there is an actual saving of cts. 1·65 per lb., on other items.

Estimating that the tea unsold will fetch 48 cts. per lb., the nett value of the whole crop will be cts. 46·37 as against cts. 45·05 last season, shewing a profit of cts. 18·07 per lb. as against a profit of cts. 16·85 in 1897.

On Drayton the sum of R10,002·83 was spent on capital account, this includes putting wooden tats in one floor of factory, new sorting room and packer, new set 14 rooms lines, and iron roofing for 20 rooms, a large new cattle shed, and opening up 8 acres of forest land in grass.

In view of largely increased yield on Drayton and the fact that neither the Turbine nor Engine are capable of driving more machinery, it has been decided to erect a small factory on Drayton division, capable of turning out from 12,000 to 15,000 lb. tea per month.

The estimated cost of above is R 20,000, and it is hoped that with more room a better class tea may be turned out, as present accommodation was insufficient to manufacture all the leaf in November and December. Some 20,000 lb. was sold at cts. 4 per lb., purchaser plucking the leaf.

The Company's properties consist of :—

DRAYTON—		
Tea in bearing	769	Acres.
Grass Land	26	,,
Timber	10	,,
Forest	9	,,
Waste Roads, &c.	69	,,
YUILLEFIELD—		
Tea in bearing	218	,,
Forest and Timber	7	,,
Waste	8	,,
Total ...	1,116	,,

THE ESTIMATED CROP FOR 1899

Drayton ...	400,000 lbs.
Yuillefield ...	90,000 ,,
Cwm ...	30,000 ,,
Total ..	560,000 lbs. at an estimated cost of cents 27·50 per lb.

Estimate includes R17,800 = cts. 3 per lb. for manuring 390 acres with Artificial, 40 acres with Bulk, and prunings being buried and lined on 70 acres, making a total to be manured of 440 acres.

PRODUCE AND PLANTING.

The Tea Trade of the United States.—The effect of the tea duty imposed last year in the United States to meet war expenses, a duty by the way which is not expected to be removed until 1900, has been to reduce importations to the lowest point. Importations for warehousing have not fallen off, but the withdrawals for consumption upon which duty is actually paid have been much less. An American paper gives the following figures, giving the comparison in the importation of tea in 1897 and 1898, and shewing the countries from which tea is shipped to the United States: France in 1897 sent 209lb and in 1898, 333lb; Germany in 1897, 39,093lb, and in 1898, 586lb; Italy in 1897, 367lb, in 1898, 640lb; Netherlands in 1897, 20,143lb, in 1898, 280lb; Russia, on Baltic and White Seas, in 1897, 600lb, in 1898, 270lb; the United Kingdom in 1897 sent 6,217,726lb, and in 1898, 2,971,116lb; Nova Scotia in 1897, 90,531lb, in 1898, 27,128lb; Ontario, Quebec, &c., in 1897 sent 2,155,758lb, and in 1898, 1,305,817lb; British Columbia in 1897, 1,005lb, in 1898, 168,336lb; China in 1897 sent 53,524,546lb, and in 1898, 39,754,736lb; India (and including, presumably, Ceylon) sent 2,117,433 in 1897, and 2,237,897lb in 1898; Japan in 1897 sent 45,465,161lb in 1897, and 22,798,308lb in 1898. About 400,000lb of tea were sent from Hong Kong in 1897, but only 189,972lb in 1898.
